

Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

- + *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.
- + *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.
- + *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.
- + *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página <http://books.google.com>

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

ELECTRICITY.

VOL. XX.

NEW YORK, JANUARY 9, 1901.

NO. 1.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	\$2.50
IN CLUBS OF FIVE OR MORE, - - - - -	2.00
FOREIGN COUNTRIES, - - - - -	4.50
SINGLE COPIES, - - - - -	10 cents

Remit by Express, Money Order, Draft, Post Office Order or
Registered Letter.

ADVERTISING RATES.

As *ELECTRICITY* reaches all classes interested in electrical
work, its value as an advertising medium can be readily under-
stood. Rates will be sent on application.
Changes of advertisements should reach the office not later
than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

Another Submarine Telephony Failure.

Although one of our lead-
ing scientists recently
read an able and exhaus-
tive paper before one of
the electrical societies,
setting forth at great
length and with an immense amount of math-
ematical formulae a method of overcoming
static induction in submarine telephony, noth-
ing has come of his suggestion in a practical
way, and the solution of the problem of tele-
phoning through a submarine cable a distance
of one hundred miles, to say nothing of from
England to America, as has several times been
suggested by enthusiastic promoters, would
seem as far off as ever.

As every electrician is aware, the static in-
duction in a long submarine telephone cable
changes the quick, short sound waves into long,
slow vibrations impossible for the human ear
to detect. This was forcibly demonstrated in
a recent attempt to telephone under the Gulf
of Mexico from Havana, Cuba, to Key West, Fla.

The experiment was made by a representa-
tive of the Southern Bell Telephone Company
of Atlanta, Ga. Two long-distance telephones
of the most approved type were used, one in-
strument being connected with a cable in the
office at Key West, and the other with the
Havana end of the same cable. The report
states that after repeated trials and by the aid
of a vivid imagination the words "Hello" and
"I don't understand you" were distinguished
as coming from the operator at Havana, but
all further attempts at conversation proved
fruitless and the experiment was abandoned.
The representative of the Bell Company is re-
ported as saying that the voices sounded muf-
fled and were merely indistinguishable blurred
sounds.

From the above it will be seen this experi-
ment was no more successful than one made
some time ago—to telephone by cable between
Dry Tortugas and Key West. As the distance
between Havana and Key West is less than
two hundred miles and the distance across the
Atlantic ten times as great, as may readily be
inferred, it will probably be some time before
telephonic communication is established be-
tween this country and Great Britain, unless
by some such costly scheme as suggested by
Mr. Edison a couple of years ago, namely, by
means of a chain of innumerable relay ships.

A Range-Finder Telautographically Operated.

As is generally known
in naval warfare the
position of an ene-
my's ship relative to
a land battery or
another vessel is determined by means of range-
finders. These instruments usually indicate
automatically the exact distance and direction
of the target from the gun. This is accom-
plished by means of an elementary principle
of trigonometry applied to surveying. The
Fiske range-finder, which was made use of to a
considerable extent in the Spanish war, gives
the distance of an object from a ship by the
aid of an electric current working through two
rheostats and a wheatstone bridge. Observers
at the bow and stern of a ship follow the tar-
get with telescopes mounted on pivots. The
turning of the telescopes varies the resistance
of the rheostats and the changes in the inten-
sity of current move a range indicator in the
wheatstone bridge.

Another range-finder made use of by this
Government, to a limited extent, is that known
as the Lewis depression range-finder, which
calculates the distance by a method of triang-
ulation, the height of the instrument above sea
level forming the base of the triangle. This
type of range-finder, for various reasons, can-
not well be made use of on shipboard and was
designed essentially for coast service.

The war with Spain proved that the Fiske
range-finder was too delicate to withstand the
vibrations of the heavy guns, and, conse-
quently, in a naval engagement, soon became
useless. The Lewis range-finder has also de-
veloped several more or less serious defects,
and, in view of these facts, it is interesting to
note that a new range-finder, invented by an
Italian, was tried near Naples last November
with alleged extremely satisfactory results.
This Italian invention is called an exterior
angle horizontal base range-finder and con-
sists of three separate instruments: The
range-finder proper at the home-station,
the angle measure at the distant station, the
angle and range indicator at the battery.
These instruments give continually and auto-
matically at the battery the range and azi-
muth from the battery of any fixed or moving
target on which the telescope at the base end
stations may be directed. The automatic indi-
cator, by means of which the information ob-
tained at the home station is transmitted, in
corrected form, to the battery, is so arranged

as to show automatically on a dial the following data and commands: Attention; load; the elevation in degrees, minutes and seconds; the azimuth, also, in degrees, etc.

The electric transmission takes place by means of an improved Gray telautograph. The angle measurer can be turned as much as 60 degrees in a minute, which is much faster than any ship can move in azimuth, and yet the indications will be continuously correct.

The apparatus further admits of an extension which is still farther time-saving. The same data that are sent to the battery central station can be automatically repeated on the rear end of each carriage, so that every gun commander has constantly before him the range and azimuth (direction in a horizontal plane with reference to the meridian, or north and south line) of the target.

With the range-finders now in use this information must be called out by the battery commander through the telephone to the gun commanders, which not only delays matters, but also takes the time and attention of the battery commander. With this automatic arrangement he can devote all his energies to other more important matters. Every artilleryman, ashore or afloat, will appreciate the tactical value of this new range-finder, and will be grateful for such a practical solution of what has been a great stumbling-block problem, more especially in the indirect fire of coast guns on disappearing carriages. It is stated that this type of range-finder will shortly be adopted by not only Italy, but Japan as well.

* * *

Electrical Apparatus Admitted Free of Duty.

So much doubt has existed in the minds of customs officials and others as to what goods are entitled to entry free of duty that the Treasury Department some time ago called attention to these special provisions of the tariff. For instance, when entry is made of any article which is entitled to entry free of duty, the oath or declaration to that effect must be made at time of entry, and no bond for the subsequent production of same will be acceptable.

When instruments, etc., for use in colleges, etc., are imported, an affidavit of the fact must be made within seven days before their arrival by the secretary, treasurer, or other responsible officer of said institution, under its corporate seal, that such articles have been imported by the order and for the sole use of the institution, and not for distribution or sale.

According to different Treasury rulings, the following articles are classed as implements for mechanical or professional use in the arts and are such as are more usually employed in the trades and professions for performing operations incidental thereto, for instance: Grenet batteries, electric batteries for generating electricity, used largely in experiments; inductive Ruhmkorff coils, used for a variety of purposes; galvanometers, used for detecting electrical current; laboratory thermometers, unmounted, used for scientific purposes; Geissler tubes, used by scientists; anemometers, used for measuring the velocity of the wind; hygrometers, used for measuring moisture in the atmosphere; aneroid barometers, used for measuring pressure and weight of the atmosphere.

The following articles are held to be philosophical and scientific apparatus, utensils, instruments, and preparations within the meaning of and entitled to free entry under the provisions of paragraph 638 of the present tariff,

viz.: A scale indicating one-twentieth milligram, and a maximum weight of 100 grains; an analytical balance, sensitive to the seventeen-millionth of an ounce; electrical instruments, consisting of a standard resistance, an alternating current wattmeter, a Siemens' wattmeter; chemical laboratory hydrometer, maximum and minimum thermometers, and Kipp's apparatus.

The following articles are among those held not to be philosophical and scientific apparatus, utensils, instruments and preparations within the meaning of the paragraph named, and are therefore not entitled to free entry: Chemical thermometers; manganese; india-rubber tubing; electric storage batteries; dynamos, ammeters, voltmeters; compasses; railroad and rectilinear lenses; pocket compasses; Zander's mechanico-therapeutic apparatus; passometers; mathematical instruments; philosophical instruments imported for sale.

Under a decision of the Department it was decided that instruments, to be entitled to free entry, must be only such as are used for the purpose of making observations and discoveries in nature and developing and exhibiting natural forces and the conditions which they call into activity.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE world's investments, in the various applications of electricity, at the end of the past century may be estimated at not less than \$2,500,000,000.

NIKOLA TESLA is reported in the daily papers as having stated that while experimenting with his wireless telegraphy instruments in Colorado they were affected by some outside source, which he ingeniously attributes as an attempt on the part of the inhabitants of Mars to signal us. In the mind of an ordinary man these extraneous vibrations would probably be attributed to atmospheric electricity. But Mr. Tesla always had a vivid imagination.

PROF. ELISHA GRAY has recently invented a method of signaling under water, using the latter as the conveying medium, in much the same way that Hertzian waves are propagated through space. Sounds have been heard, so it is alleged, by this method a distance of twelve miles. The modus operandi of the system will be gone into more in detail at an early date.

PROF. FRANK PARSONS, of Boston, president of the National League for Promoting the Public Ownership of Monopolies, testified on January 5 before the Industrial Commission in Washington, on the subject of the telephone service of the country generally, and that of the District of Columbia in particular. He said from \$30 to \$35 a year for an unlimited service with only one instrument on a line would be a fair rate in any of the large cities. He further stated that telephone rates are higher in this country than anywhere in Europe.

STUDENTS of the smoke-consumption problem are directing attention just at present to certain experiments which have been conducted in London with a view to develop the possibilities of electricity as an agent for pre-

venting the smoke nuisance. Thus far, says the "American Inventor," the work has not reached the practical stage, but it appears from the tests already made to be feasible to equip large chimneys or furnaces with an electrical apparatus which will condense the smoke by the attraction of a powerful current and so minimize, if not absolutely remove, the quantity of smoke particles conveyed upward by the gases flowing from the combustion chamber.

A FEW minutes after midnight on the 1st inst. the Toronto Electric Street Railway Company inaugurated the new century by starting a new 1,600 horse power generator and a large engine to drive the street cars of the company. The generator is one of the best in the company's power house, and in a patriotic vein it has been christened the "Father O'Leary," in honor of the brave Catholic chaplain of the first Canadian contingent to South Africa which has recently returned to Canada.

MAJOR WALTER REED, surgeon in the United States Army, in a report to Major General Wood states that the Woolf system of sewage purification as carried on in Havana is inadequate as a disinfectant, and that chloride of lime would have given better results at less cost. This may possibly be the case in Havana, but electrozone certainly proved an excellent sterilizer at Brewsters, N. Y., and did much to render Riker's Island inoffensive.

MR. HART O. BERG, the European representative of the Electric Vehicle Company, is in America on a short trip. He says he believes every person of means in Paris will soon own at least one electric brougham, a victoria and a small gasoline-driven voiturette. Mr. Berg thinks the day of the large petroleum carriage is coming to an end, as the voiturette, holding from two to four persons and weighing from 900 to 1,200 pounds, is getting more and more popular.

BISHOP POTTER of New York was supposed to be suffering from gout for twenty-five years, but by the use of the X-ray it was discovered that he had been suffering from the inflammation of several small broken bones in his foot. The prelate has good reason to bless Prof. Roentgen.

BOTH Howard Abel, of Chicago, and Henry C. Davis, of New York, the agents of Charles T. Yerkes, are now installed in London, busily engaged in pushing the underground railroad work, which they hope to have in good shape by the time Mr. Yerkes arrives there in March.

THE Long Island Automobile Club will receive a magnificent gift in the course of the next six months in the form of a building to be used by the organization as a club-house. The club now has quarters at No. 552 State street, Brooklyn, and it is expected that it will move into the home to be given to it in May next.

A DISPATCH from Washington states that undue friendship for the Chesapeake and Potomac Telephone Company on the part of some members of the United States Senate is alleged by members of the Telephone Subscribers' Association who have for years been fighting for cheaper telephones in the District of Columbia. In the testimony in a suit brought to compel this company to reduce its rates in

compliance with a law of Congress it was developed that the company had twenty "dead-head" telephones. One of the attorneys for the telephone subscribers said no effort had been made to ascertain who had these "dead-head" telephones for the reason that "it was not believed to be politic to go into that question."

AN organization to be known as the Gas and Electric Fitters' National Association of America was formed in Chicago recently. Its promoters are confident it will strengthen the local union and decrease dissensions now existing between gasfitters and other trades.

CHLORATE of potash caused the explosions at Tarrant & Co.'s drug-house on Oct. 29 last, according to Prof. C. F. Chandler, the chemist, of Columbia University, who, at the request of Fire Marshal Seery, examined the testimony taken at the investigation into the origin of the fire. There were several tons of chlorate of potash stored on three or four floors of the building. In his report to Fire Commissioner Scannell the Fire Marshal gives it as his opinion that the fire was caused by the ignition of tar between the double floors. The loss by fire and explosions is estimated in the report at \$1,000,000.

A BOOT manufacturer in Switzerland is reported to have hit upon a novel means of improving the load factor of the plant which supplies electrical energy to his factory, says the "Electrical Engineer," London. This energy, it should be mentioned, is required principally for lighting purposes at night. With the exception of a comparatively small amount required for a motor load, most of the available power has hitherto been unutilized during the day, although a constant supply has to be maintained by the supply company, and paid for accordingly by the manufacturer. An arrangement has now been devised whereby it is proposed to remedy matters. Curiously enough, the idea was suggested by the abundant fruit harvest of the past season, and consists in no less novel an innovation than the artificial drying of fruit by means of heat generated by the surplus electrical energy. The apples are peeled, cored and sliced by machinery, the rings being thereupon consigned to electrically-heated ovens of the traveling type, wherein the evaporation may be regulated to a nicety. Judging from the success which seems to have attended the experiment it appears quite within the bounds of possibility that the method may find favor in such isolated cases where the local conditions are so eminently adapted.

A NEW variety of electric fire alarm has been produced in which no batteries are used. The system is intended for small towns and cities and is very thoroughly worked out. In each alarm box is a magneto machine, similar to that used in connection with the telephone as a call bell, which is connected with a powerful clock spring through appropriate cams and levers, so that when the box is operated by means of a key the armature of the magneto machine receives a definite succession of short, quick half turns. Each of these sends out over the circuit in which the box is connected an impulse of electrical current which may be of considerable power. This is received in the usual way on gongs and registers. To complete the system an ingenious line tester is used: normally, when everything is in proper order,

all the circuit is closed, but no current is flowing in it. If this circuit should be opened at any point, the boxes would not work, so the tester is used to send out, every two or three minutes, as may be desired, small impulses of current to ascertain the condition of the line. Its mechanism is very similar to that of the box. Upon the armature of a magneto machine is suspended a weight which is wound up by clock work and released at short intervals. This apparatus is connected into the line, and if everything is in good working order the resistance encountered by the armature of the magneto when the weight is freed causes the latter to descend slowly. Should, however, the circuit be open, the weight drops quickly and rings in an alarm for open line.

ON December 22, according to the London "Electrician," Prof. Slaby delivered a lecture in Berlin on multiple wireless telegraphy before the German Emperor and his suite and a distinguished audience. Prof. Slaby has been devoting his attention for a considerable time to devising a means of Hertzian signaling between several independent pairs of stations without the messages interfering with one another, and he has now apparently solved the difficulty. The method employed seems to be simple tuning. During the lecture Prof. Slaby signaled to two stations, one at Schönweide on the Upper Spree, 8 miles distant, and the other in the Professor's laboratory at the Charlottenburg Technical College, about 2½ miles distant. Messages were received from these two stations in the lecture-room simultaneously. For both sets of the receiving apparatus on the lecture table the lightning conductor on the chimney of the Schiffbauerdamm electric lighting station was utilized as an air-wire without removing its earth connection. The lecturer explained that the arrangements were such that the waves in the two cases were of an exactly predetermined length, and that the two sets of apparatus were each tuned to a different wave-length.

ACTING upon the invitation of the Central London Railway the Board of Trade has appointed a committee to consider the question of vibration caused by the working of the line, regarding which many householders along the route have made strong complaint. The committee will ascertain what alterations can be devised to remedy the trouble. American engineers consider the railway is using electric engines that are three times heavier than necessary to perform the work they are called upon to do.

A GOOD deal of progress has been made in Barcelona, Spain, and vicinity since last July, in completing electric roads already in process of construction, and in changing from horse and steam to electric traction. The Compañía Anónima, owned entirely in England, has completed, and is running its cars on a double track of about twenty-five miles through the principal streets of Barcelona. The chief constructors were an English firm, but the wire, tracks, electrical machinery, engines and motors all came from the United States. The same firm of contractors will also build, within a short time, a four-mile single track road in the same city. It is now operated by horses, and when electricity has been installed the line will be operated in conjunction with the other road. The contracts are all let for furnishing the eight-mile road from Barcelona to Horta, one-half of the line being ready for use. The only

hindrance to the sale of American electrical goods in Spain are the higher duties than on the same goods of other nations, but the difference in price is enough to give the preference to American goods.

A CABLE from England states that at a meeting of the London Underground Railway Company on January 7 it was voted to issue bonds for \$3,330,000 for the purpose of changing the motive power from steam to electricity. A shareholder asked the chairman of the meeting if an American syndicate was to do the work. The chairman replied: "Some Americans are putting in bids. We will select the best firms available."

ADVICES from abroad state that the work of constructing the telephone line which is to bring France and Italy into close unity is making great progress, the connections with Paris on the French side of the Alps having already been completed. Operations on the Italian side, however, are even more advanced, for the installation, which, for this particular part of the line, cost only one hundred million francs, has been made, and now the engineers are turning their attention to the erection of the line between Turin and Novi. After this it will be carried to Genoa, and thence along the littoral to the Italian capital. Paris and Rome, it is expected, will be in direct telephonic communication by March or April next.

IMPORTANT trials of submarine boats took place at Cherbourg, France, on January 7. The Minister of Marine, M. de Lanessan, and the Minister of War, Gen. André, went to Cherbourg specially to watch the experiments. After an examination of the submarine boat Morse, M. de Lanessan boarded the Narval and proceeded to the roadstead where a number of surface and submarine manoeuvres were carried out, Gen. André witnessing them from the Imprenable. The tests concerned new electric accumulators invented by a French naval lieutenant. The trials resulted satisfactorily.

A VERY large order of trolley wire is about to be shipped from Ansonia, Conn., to the far East. It consists of one million pounds of wire for a trolley road in India. A train of between fifteen and twenty cars will be needed to ship it to New York to be placed aboard a steamer.

ALUMINUM is, at the present price, the cheapest metal in the market, with the exception of iron, zinc and lead, says the "Electrical Review," London. This metal is now extensively used in place of copper, brass, tin, and in some cases even iron, especially when the reduction of dead weight is a question of great importance. Aluminum is also beginning to be very largely used in connection with electricity, as electrical conductors on this metal, giving the same conductance as copper, weigh only half as much, and cost less. It is impossible to foresee the ultimate extent of the use to which this metal can be put, but the progress made in aluminum during late years justifies the most sanguine expectations. Twenty years ago, the total output in the world did not exceed four or five tons, and its price was about \$30,000 per ton; ten years ago its price was reduced to about \$10,000 per ton, and the output increased to about 30 tons per annum; now the price is from about \$650 to \$700 per ton, and the output during the last twelve months is reckoned at 5,000 tons.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 9.

THE PRINCIPLE OF THE DYNAMO.

The action of the dynamo is a demonstration of the production of electrical action by magnetic induction. The induction coil is another example of the same law and by varying the flow of current in the primary the magnetic field is set in motion and will act upon the secondary winding or coil inducing electrical action in it. In the dynamo, however, the operation is just the reverse of that in the coil, for instead of putting the lines of force in motion and permitting them to act on a stationary coil, the lines of force remain stationary or constant and the coil of wire is put in motion.

By electric magnetism an intense magnetic field is secured and retained in which is rotated a coil of wire, which will by this means have induced in it electrical action so long as it is kept in motion within the field and cutting the lines of force.

FIG. 1.

The first discoveries in this resulted in the construction of a machine in which a single coil of wire was rotated in a field of force created by a permanent magnet. This has developed with slight changes to the ordinary magneto, or sometimes called magneto generator, so common in general system telephone work to-day. The magneto led to the replacing of the permanent magnets by electro magnets to secure a more intense and greater field and also to a means for collecting the induced current by the use of a commutator so that the flow in the circuit would always be in the same direction.

When a wire is set in motion in a magnetic field so that it cuts the lines of force, the action will cause a difference of electrical pressure between the two ends of the wire. The direction and magnitude of the induced pressure depends upon certain relations existing.

The pressure depends upon the number of lines of force cut by the wire in a given period of time. It is given as a rule that when a wire cuts one hundred million lines of force in a second of time, the induced action will have a pressure of one volt, or if it cuts two hundred million lines in a second, the induced action will have a pressure of two volts and so on.

The number of lines of force that will be cut in a given period by a wire in motion in a magnetic field depends upon four items. First—Upon the strength of the field which means the intensity of the magnetic condition between two poles. Second—By the length of wire that is being acted upon by this magnetic field. Third—Upon the angle at which the wire

moves across the lines of force. Fourth—The speed with which the wire moves.

The direction of the induced electrical pressure depends upon two things. First, upon the direction of the lines of force in the magnetic field, and second, on the direction in which the wire cuts through them.

FIG. 2.

In Fig. 1, if the vertical arrows show the direction of the lines of force and the horizontal arrow indicates the direction in which the conductor A B is moved through the lines then the direction of the induced pressure in that conductor will be from A to B, that is, the end B of the moving wire will be positive and the other end negative. If the direction of the wire's motion is reversed, that is, it be moved through the lines in a direction opposite to that indicated by the horizontal arrows, the direction of the induced electrical pressure will be opposite to that first induced, thus showing that if the direction of the wire's motion be reversed, the direction of the current will also be reversed. Reversing the direction of the lines of force will also reverse the direction of the induced current.

There are numerous ways of remembering the direction of the induced current, the direction of the wires' motion, and the direction of the lines of force. A good way, however, is to hold out the right hand with the thumb sticking straight up, the first finger pointing out and the middle finger turned to the left and pointing at right angles to the first finger. Now if the hand be placed in such a position that the thumb will point in the direction the wire is moving, the first finger in the direction of the lines of force, then the middle finger will indicate the direction of the induced current in the wire.

FIG. 3.

In Fig. 2, suppose N and S represent the two poles of a magnet and the wire X represents the conductor in motion within the field created by the magnet. The wire is represented as a complete circuit, rotating on a shaft, with one half of the circuit on each side of it. Then

if this be revolved in the direction of the arrow there will be induced electrical action in a different direction in each side of the circuit as indicated by the arrows on the dotted lines. You will also notice that the induced action must also change its direction in the wire in every half of a revolution.

To collect the current induced in this conductor an arrangement is used called a commutator and is shown in a simple way in Fig. 3.

You notice that the circuit B constitutes part of the entire circuit but is not in motion however. The current is collected by the brushes and while the plates C D revolve with the coil X, yet the brushes E and F remain stationary. As the coil is revolved the current changes its direction every half revolution, still the flow of current in the circuit B will always be in the same direction.

As was before stated electro-magnets are provided to secure a strong field of magnetism and the next point to take into consideration is the construction of one on that principle, and the laws governing it.

FIG. 4.

In Fig. 4 you will readily recognize a rather familiar type. Although made up of a number of parts of soft iron bolted together it is actually a horseshoe magnet, only not a permanent one, but dependent on the law of electro-magnetism for the magnetic field produced by it.

The names of the parts are as follows: B B are the "cores," A the "yoke" and P P the pole pieces. The space C is called the magnetic field; this is where the magnetism is the strongest and where the coils, called the armature, are revolved.

Coils of insulated wire are wound on the cores and the strength of magnetism secured will depend entirely on the number of turns of wire wound on the coils and the amount of current flowing through the wire. This is reckoned by ampere turns and is generally called ampere turns of magnetic condition. To calculate this multiply the number of turns of wire, that is, the number of times the wire is wound around the iron, by the amount of current flowing and this will give the ampere turns.

One ampere turn is one ampere flowing once around or its equivalent; for example, one half an ampere flowing twice around would be one ampere turn or one-quarter of an ampere flowing four times around would be one am-

pere turn and four amperes twice around would be eight ampere turns, etc.

The magnetism secured may be called magneto motive force or magnetic pressure, terms which are similar to electromotive force or electrical pressure.

The number of lines of force in any magnetic circuit is equal to the magnetic pressure divided by the reluctance of the circuit. It can be shown mathematically that the magnetic pressure in a complete magnetic circuit is equal to the number of ampere turns multiplied by a constant, which is practically 1.

In order that the strongest possible magnetism will be produced in a magnetic circuit it is essential to have the circuit made up as far as possible of material having the highest permeability, which is soft iron, and to arrange as many ampere turns as possible to set up the magnetism.

Article No. 10 will treat of this same subject.

NAVAL GUN CIRCUITS.

The advantages that are obtained by using electricity for firing guns in the navy are twofold, says the "Electrical Review," London. First and foremost is the increased safety; for with its electric circuit broken until the gun is run out, a gun can only be fired in a safe position, and the fuse, or tube as it is called, containing no fulminate of mercury, allows of rough handling of the cartridge, which under the circumstances that attend a rapid and continual fire is inevitable, or practically so. The second advantage is in the position of the captain of the gun, who can keep his eye along the sights and his finger on the trigger the whole time the gun is being loaded, so that he is ready to lose no time directly the gun is out again.

In percussion firing, which is always an alternative in case of the electric circuit failing, the lanyard that releases the striker is not in the hands of the captain of the gun himself, it is pulled by a subordinate on the word "Fire!" When the movement of the ship is considered, together with the motion of the target, the fraction of time that elapses between the word of command and its execution makes no small difference to the practice.

6-INCH Q.F. GUN CIRCUITS.

A reference to the accompanying diagram will show how the circuit is arranged in the 6 inch quick-firing gun. The sights are fixed on the mounting, and not on the gun itself, which, by its recoil, would otherwise force the captain of the gun to take a fresh alignment each round. There are two sets of sights, one on either side, two batteries, and naturally two distinct firing keys, which are in the form of a pistol, the trigger making contact on being pressed.

The circuit in each case may be traced from the negative pole of the battery through the

firing key to a rubbing contact at the outer extremity of the recoil slide; a contact piece on the gun itself takes against this when the gun is fully run out, and only then is the circuit complete to the striker. The striker, so called from the fact that it is made to do duty as such when percussion fire is resorted to, consists of a steel tube filled with gutta-percha insulation, through the center of which runs the circuit, ending in a brass nipple, which takes against the contact piece on the fuse itself when the breech is closed. A mechanical device on the breech prevents this nipple from making contact until the breech-piece is properly home, so that it would be impossible to fire the gun with the breech only partially in position. The nipple makes contact with a small disk that is well insulated from the brass cartridge into which the fuse is screwed, and the circuit proceeds from this disk to a thin platinum bridge embedded in priming composition and thence to earth, which is represented by the brass cartridge case and the gun. The positive pole of the battery being brought to the gun mount-

TURRET CIRCUITS, 12-INCH R.L. GUNS.

ing picks up the return through the gun. Now, it will be seen that no dangerous premature explosion can take place, even through the greatest carelessness. In the excitement attendant on gun practice, details of the drill-book are sometimes overlooked, and however well trained a man may be, he is not infallible, as the occasional accidents that have occurred in times past go to show.

It may be argued that mechanical means can be provided to prevent the striker from being released, in the case of percussion firing until the gun is in a safe condition, and that electric circuits have the disadvantage of giving out on small provocation; this is true, but hitherto it has been found very hard to devise a percussion lock that will withstand sufficient wear and tear to be absolutely reliable. With electricity, if there is a failure it is on the safe side, for it simply results in the gun not going off at all.

The turret or barbette circuits in battleships of the later types, such, for instance, as the *Majestic* class, serve as a very good illustration of the precautionary measures that are provided to insure against accidental firing of the gun when in an unsafe position, or before the breech is properly closed.

The safety arrangements may be divided into four, namely, the firing key, the rear switch,

the run-out contact and the breech-locking bolt. If we trace the circuit in the accompanying diagram, we shall see that it is in duplicate, one battery being placed on each side of the turret, and the connections between each battery and its individual gun exactly similar. Thus, in either case we start from the negative pole of the battery and come first to the firing key. This key or pistol is represented in the figure at K and it is placed in the sighting hood from which the captain of the gun lays his sights.

The circuit is seen to continue from K to the rear switch S.

The rear switch has two duties to fulfill, the most important being the safety it provides for the man whose duty it is to place the fuse or tube in the gun. If this switch is at "off" it is obvious that the tube cannot be fired while the man is immediately in rear of it, and thus cause, by the recoil of the gun, the death of the man attending the breech mechanism; it is under his control, and he only puts it to "on" when he is in a safe position immediately before the gun is reported ready.

From this switch the circuit proceeds to R, the run-out contact. This contact is made by the gun itself, automatically, upon reaching the limit of its run-out position, so that in case of the gun not being properly run out to its full extent it will be impossible to fire it. Were this safety arrangement not there, the gun might be fired when only half out. Its recoil would then be only partially absorbed by the hydraulic cylinders, and disastrous consequences might ensue; in any case there would be a heavy strain brought upon the mounting. From this contact we now come to the fourth and last safety arrangement, which is the breech-locking bolt B.

The breech-locking bolt provides against the gun being fired when the breech is not properly closed, and in order to explain its action it will be necessary first to examine the means by which the breech is screwed home.

After the gun has been loaded, a cradle, in which rests the breech piece, is moved over by a hydraulic ram until it is opposite the chamber. A second ram then pushes it from the rear into the gun.

So far the breech piece is not locked in any way, and it is not until the gun begins to run out that a projection on the breech piece, taking in an inclined slot on the carriage, forces it to revolve within the chamber and the screw threads to take. Until the breech has performed nearly a quarter of a turn, it is not properly home and the gun is not safe. To provide against the possibility of the gun being fired without the breech being properly and securely closed, the fourth safety device is designed. It consists of a locking bolt which works on an inclined plane as the gun runs out, and the circuit is passed through this bolt, insulated from it, of course, so that when the bolt locks the breech piece to the gun the fact of its coming into position completes the circuit.

The circuit proceeds then from the locking bolt direct through the contact piece on the gun tube, thence through the fine fusible bridge embedded in priming composition, and thence to the brass body of the gun tube, where it picks up an earth return in the metal of the gun itself; the positive pole of the battery being led to earth.

With the circuit as at present described, it will be seen how either battery may be made to fire its own particular gun. But in practice it

is often necessary to fire both guns simultaneously.

The captain of the barbette or turret usually takes up his position in one of the sighting hoods, and lays both guns from that position—it would cause waste of valuable time if he had to change his position for each gun—and so the two circuits are connected together by a wire between the two switches S. It will now be seen that either battery may be made to fire the guns singly, or both guns simultaneously, according to the connection made by the switch at S, so that if either battery fails the other may be substituted.

A vertical galvanometer, offering a resistance of 1,000 ohms, can be switched into the circuit in place of the firing key immediately before the gun is fired, and this will show if the circuit is complete. Its high resistance renders the current too small to fire the fuse, and thus the circuit may be tested when the gun is loaded.

THE DEVELOPMENT OF THE DENSITY FACTOR.*

BY C. TURNBULL,
Borough Electrical Engineer, Tynemouth.

The density factor of an electricity works may be defined as the number of 8 cp. lamps connected per £1 worth of mains laid, or perhaps better as the number of units sold per annum per £1 worth of mains laid. Mains in this case should include transformers and the like. Owing to the great cost of every yard of cable laid, it is of the utmost importance to have a good density factor. Indeed, it may be said, take care of the density factor—i. e., get the main loaded up with every kind of consumer within reach—and the load factor will take care of itself. The density factors of the following towns, taken quite at random from "Garcke's Manual," will serve to show the great differences that exist:

	8 cp. lamps connected per £1 worth of mains.	Number of units sold per annum per £1 worth of mains.
Aberdeen.....	1.21	7.8
Brighton.....	1.03	25.4
Derby.....	.89	17.5
Edinburgh.....	1.12	30.6
Harrow.....	.64	6.5
Manchester.....	.94	18.8

The cost of transformers has not been taken into consideration in the above, as it is not shown separately in the manual. Seeing that mains represent some 40 to 50 per cent. of the capital expenditure, I think the figures are worthy of consideration.

Rented Wiring.—To meet those who do not wish to be at the expense of wiring their premises, it has been proposed to take the mains throughout the building instead of stopping at the meter only, and to charge more for the current consumed to cover the extra cost. This method is not entirely satisfactory, especially seeing that the modern tendency is to make consumers pay a fixed sum per annum to cover standing charges, with a comparatively small charge for current used. I would suggest that the following points are desirable in a system of rented wiring: For a plain fitting, including lamp and switch complete, a fixed quarterly rental should be charged. Additional fittings on the same switch should be charged at a second and lower rate. Additional lamps on a fitting not having independent switches should be charged at a third and still lower rate. The

*Paper read before the Newcastle Section of the Institution of Electrical Engineers. From the "Electrical Engineer," London.

hirer should have the option of hire purchasing the installation at rates based on the rentals, or he should be allowed to purchase outright at any time for a reasonable sum. When the station does the wiring, the rentals, etc., may be settled by an examination of the average costs of installation, but, personally, I prefer to have the wiring done by a wiring firm, as it needs more supervision than most of resident engineers are prepared to give. Besides, with smaller stations at any rate, there will not be a sufficient flow of work to keep an efficient staff busy, unless outside firms were discouraged, which would be foolish. When the wiring is done by contract, the terms must be settled by bargain. In Tynemouth we have arranged with a private firm to do the wiring, we to collect their rentals. A plain fitting costs 5d. per quarter, or a fitting without a separate switch 4d. per quarter; while an additional

lights is switched on, another lot will be switched off. In many cases people will only wire a few rooms in their houses to make sure that they will not at any time be let in for a big bill. It has been proposed to meet the difficulty by having two meters—one to register during the hours of heavy load, and the other during the hours of light load—the units registered on the latter being charged at a lower rate. On examination this will be found unsatisfactory, for a shop which, say, averages two hours a day throughout the year will be charged at the high rate although undoubtedly a good customer, while an office which occasionally overlaps the station maximum demand and takes current only during the winter months will get off at far too light a rate. I would suggest to you that houses which have a good steady load throughout the year will not appreciably increase the station maximum de-

FIG. 6.—TRIPHASE LABOUR ALTERNATORS AT ENIGNS, FRANCE.

lamp on a fitting is 3d. per quarter. Double these rates will pay off the cost in 4½ years, or 1½ times the rates will pay it off in 6½ years, or the hirer may buy at any time at a moderate price. Of course these terms are not suitable for large houses, and in many towns special arrangements would have to be made to meet special cases; but it is to be observed that rented wiring is intended mainly for small consumers.

The Two-meter System.—It has always been a trouble with the maximum demand system that consumers are in fear that their accounts will go up with a jerk if they happen to put on two or three extra lights some night. This has been met in various ways, such as by allowing the demand indicator to be short-circuited on special occasions, or by having two-way switches arranged so that if one lot of

mand by having bedroom and other short-hour lights connected up in addition to their long-hour lamps, nor will they require any heavier mains. It is therefore worth while to do something to rid their occupiers of the fear of a largely increased maximum demand if these occasional lamps are connected up. This can be done by allowing consumers to have two meters, one for the long-hour lights and the other for the remainder. The units registered by each meter are charged as if for a separate consumer, so that practically the full rebate is obtained on the long-hour lights and none on the occasionally used ones. A small extra rent is charged for the second meter, which may generally be of the cheap kind now coming into use. It is also often possible to omit demand indicator, as, of course, the demand on each meter is the full number of lamps con-

nected thereto. This concession has the effect of relieving people from anxiety, so that they wire their houses freely, and I doubt not they will use their light freely too.

III.—HIGH TENSION POWER TRANSMISSION PLANTS IN FRANCE.

BY FRANK C. PERKINS.

Engins-Grenoble Polyphase Power Plant.

Among the many power transmission plants in France none are of more interest than that introduced by the Société L'Eclairage Electrique of Paris and supplying current to Grenoble and Voiron from the power house located at Engins, France. The enormous potential used on this transmission line is of itself enough to interest any engineer in this installation. This

single static transformer is somewhat different from the usual American practice, where three separate single phase transformers are used, the connections being so arranged that they may be connected up "star" or "delta" as desired for three phase operation. This is particularly the case when large transformers are used in America for power transmission work, and usually when rotary converters are found necessary, three separate single phase transformers are supplied for each rotary converter. Not only do the French engineers favor the single three-phase transformer, but the German manufacturers also build them extensively and claim for them a greater output for the same amount of iron, and a less core loss.

Two low tension alternators of the tri-phase type are each directly connected (Fig. 6) to a turbine of 500 horse power capacity in the adjacent room. The stationary armature of the

FIG. 7.—HIGH TENSION POWER TRANSMISSION LINES IN FRANCE.

power and lighting circuit (Fig. 7) supplies not only the current to light Grenoble, and Voiron but also other places along the route of 40 kilometers, notably at Massinage. The potential used on this line is 15,000 volts. The distance from the power house at Engins to Grenoble is 10 kilometers, while the line running to Voiron is more than 30 kilometers long. The power house is built of masonry and is divided into two parts, a turbine room and a generator and transformer room.

The alternators, Fig. 6, were designed by M. Labour and are of the three-phase type having stationary armatures and revolving fields. The voltage of the generators is raised to 15,000 by triangular step-up transformers of the type shown at the left in the illustration. The foreign practice in transformer building is to use three cores and three sets of primary and secondary coils placed over these cores and held in place by an upper and a lower yoke, which completes the magnetic circuit. This method of transforming the three-phase currents in a

alternator is so constructed that it can be moved along the base at the will of the engineer, leaving the revolving field exposed, and when desired repairs can be made with great convenience. The output of each machine is 375 kilowatts and the plants supply not only current for lighting purposes but also for operating a number of motors varying in size from $\frac{1}{2}$ horse power to 100 horse power.

The next power transmission plant to be considered is that located in the Valley of Gresivanden at Lancey, France. This plant supplies current for lighting 35 different villages in this valley, as well as power for small motors in the various factories. The next issue of *ELECTRICITY* will contain an exterior view in one of the villages with its pole line construction and transformer for supplying the lights in the neighborhood. An interior view will also be given of the low tension alternator and turbine. This was one of the first plants in France to be operated with a 12,000 volt transmission line.

THE ELECTRIC ACCUMULATOR.*

BY H. C. SCHAEFER.

From the earliest days it has been attempted to store up energy of various kinds for use at a later period, as, for instance, the storage of water and gas in large tanks for use at periods of demand. Thus between 1850 and 1860, when electricity was first coming into use commercially, it was attempted to store up this kind of energy also. Of course they did not accomplish very much at that time, but, as everyone knows, the first experiments often lead to great results later on. In 1854 Mr. Sinsteden, in experimenting along this line, found that by sending an electric current for a certain time through two lead plates, which were immersed in a vessel containing dilute sulphuric acid, the plates themselves became able to deliver current for a short time after the supplying circuit was removed. He also found that this secondary current flowed in an opposite direction to the primary current. As he did not realize the importance of this discovery at the time he dropped the matter altogether. In 1860 a Frenchman, Gaston Planté, tried on the basis of the former experiment to construct a secondary cell for telegraphic work, but as he could not obtain sufficient capacity, he also allowed the matter to drop. In those days the commercial value of secondary cells was not appreciated. For several years nothing further was heard of the matter until electricity began to be largely used on a commercial scale, then the necessity for a secondary battery began to be apparent, and many inventors started work along this line. Planté, among them, attempted to develop the accumulator, and in 1879 published the results of his experiments, and also the method of making a durable cell.

At this point, let us see how the lead plates and the acid behave when an electric current is passed through the cell; in other words, what chemical action takes place under this condition. Let us examine the action in a formed, but discharged cell. This has in this condition on each plate a chemical combination of lead oxide and sulphuric acid called lead sulphate. Now, in sending a current through the cell, or in "charging," as we call it, a part of the water in the acid is disintegrated into its elements—oxygen and hydrogen—the oxygen passes to the positive plate, and uniting with the lead sulphate forms a higher lead oxide called lead peroxide. The sulphur and part of the oxygen which was contained in the lead sulphate is recombined with the acid in the cell. The plate in this condition has a dark-brownish color. The hydrogen which is freed by the decomposition of the water passes to the negative plate and combines with the oxide of lead, forming sulphuric acid, which also goes into the solution. The active material is left on the plate in the form of spongy, porous, metallic lead. This plate will have a bluish-gray color when fully charged. From this it can be clearly understood that in charging the acid density or specific gravity will always increase, provided the acid is free from impurities. If the acid is not chemically pure actions other than those described will take place, seriously interfering with the action of the battery, as well as decreasing its efficiency. This shows that it is

*Paper read before the Electrical Association of New South Wales, England.

absolutely essential that the acid for electric accumulators should be absolutely pure, otherwise satisfactory results cannot be obtained. Now, when the lead oxide on the plates has all been formed into peroxide and spongy lead the current can no longer do any storage work. The oxygen and hydrogen escape freely from the positive and negative plates, forming on the surface of the acid a mixture of the gases called oxyhydrogen, which, when lighted, will burn with an explosion, forming water again. When this free escape of the gases takes place the acid density will no longer increase, and the battery is fully charged. In discharging the cell we know that the current will flow in the opposite direction. We will now see what chemical actions take place under this direction of current. The oxygen this time, instead of going to the positive plate, passes to the negative and unites with the spongy lead, forming lead oxide, which, combining with the sulphuric acid out of the solution, deposits lead sulphate. The hydrogen this time passes to the positive plate, and, combining with one part of the oxygen of the lead peroxide, forms water, which passes to the solution. On this plate, also, the sulphuric acid combines with the lead oxide and forms sulphate of lead. We can now see that in discharging a cell the acid density or specific gravity decreases, as in charging acid is formed; in discharging it is disintegrated. We have now the same condition in the cell as we had before charging. The longer we leave the battery uncharged the more sulphate of lead will be formed and the lower will fall the density of the acids in the cells, and eventually such a deposit of the sulphate of lead would be formed on the plates as to absolutely ruin them. This teaches us never to give a battery too long a rest when it is discharged. It is always wise to charge a battery as soon as possible after it has been discharged. Planté, in making his plates, did not fill them with paste at all, but, by sending a low current through them, formed peroxide of lead on one plate and spongy lead on the other out of the metallic lead of the plates themselves. He soon found that in sending a current through them in one direction the formed material increased very slowly and remained in a very thin layer over the surface; in fact, it would reach only a certain thickness before it ceased to increase at all, whether the current was kept flowing or not. He, therefore, found that, in order to get a greater capacity, he must look for some other method of increasing the amount of active material. This action is analogous with the oxidization of the various metals by the moisture of the atmosphere. As, for instance, iron, copper, lead, zinc, and so forth, when exposed to damp atmosphere, form a certain amount of oxide on their surfaces. After a certain point this oxidization will not increase—the inner part being protected by the coat of oxide already formed; this action is nearly the same as with the accumulator plates when trying to form them as Planté first did.

In forming the accumulator plate it is necessary to get as much active surface as possible without actually destroying the strength of the plate itself. The greater the amount of active surface the greater the capacity of the accumulator will be. Planté, after further experiments, found that by frequently changing the direction of the current through the plates, he could enormously increase the effect on both plates, and that the plates so formed

had a very good capacity and a long life. In this way Planté was very successful in building up a good durable accumulator, but, as it took a prohibitively long time to give his cells even a fair capacity, it never attained a commercial success, the cost of forming being entirely too great. To reduce the time required for forming and attendant cost of manufacture, Mr. Faure, instead of forming active material out of the plates themselves, gave them a coating of lead oxide, or, in other words, he "pasted" them, as we now call it. By this means it was found that the time for forming could be reduced to a period covering several days only instead of years. An accumulator thus made showed a very good capacity, but the paste, while adhering very well to the negative plate, would not remain on the positive. In a very short time it would loosen from the positive plate, falling down and greatly reducing the capacity. As the ordinary charging current was too high to properly form peroxide it rotted the plates instead of forming them; the peroxide forming too rapidly would scale off in chips, leaving the clean lead for further forming, thus in a short time destroying the plate entirely without obtaining an active surface. This cell, as well as Planté's, was not a commercial success. At this time things did not look very bright for the success of the electric accumulator, but a better one was about to be evolved by a Mr. Tudor of Rosport at Luxemburg.

Before we see how he accomplished this, let us ascertain why the active material made according to the Planté method remained in such close affiliation with the plate itself, and why that formed after Mr. Faure's method did not. The negative plate is not subject to disintegration as is the positive, for the following reasons, and may, therefore, be left out of the question. Spongy lead, electrolytically formed from lead or lead oxide, is so porous that it leaves room for the lead sulphate to settle, without forcing it apart or without injuring its contact with the plate itself. In other words, the spongy lead is so amalgamated with the lead itself that the expansion due to deposition of lead sulphate is not sufficient to cause it to fall off. It therefore follows that the great difficulty has been to find a method to properly form the positive plate. Mr. Faure did not succeed because he could not give the active material enough hold on the grid of lead to prevent it from falling off. By the Planté method of formation, not only the external surface, but the surface of the fine pores of the lead as well, was formed into peroxide, and as the peroxide is larger in volume than the lead itself, it formed a very secure connection with the grid of plate. The more peroxide that is formed the more these pores will be enlarged, and the more acid and oxygen will find its way to the active material and inner parts of the plate, tending still further to form peroxide, which is thoroughly amalgamated with the surface of the lead plate. This action will continue for a certain time, the peroxide penetrating deeper and deeper, until the acid ceases to reach the metallic lead under a given current density. The formation may then be called complete. This action is carried on until as much active material is obtained as possible without destroying the strength of the grid itself. It can now be said that the capacity of the battery will depend upon the amount of surface the plate presents to this action, the best battery being the one which will present

the most active surface for a given weight of lead without weakening the structure of the lead. Faure, as previously stated, pasted his plates before forming them. In forming the lead oxide paste was formed into peroxide, which occupies a larger volume than lead, and as there is no good contact between the plate and peroxide the latter soon scales off and the capacity drops. As the charging current is too strong to form a thin sheet of peroxide this eventually leads to the entire destruction of the positive plate. The action is the same in all plates made in this manner; that is, in all pasted positive plates the falling off of the active material will sooner or later entirely destroy the battery, the difference in expansion between lead peroxide and lead sulphate requiring a very strong contact with the metallic plate.

Mr. Tudor, in studying the accumulator question, considered deeply the two methods—that of Planté and that of Faure. By carefully analyzing the reasons for their failure, he succeeded in bringing out the first battery of the well-known "Tudor" type, which battery, when finished, he installed in his residence at Rosport in 1882, where it has been in satisfactory operation ever since. And now let us investigate his method of producing the first good commercial plate. He did this simply by combining the Faure and Planté systems. After charging his plates for a certain period, say three to four months, as Planté did, he obtained a very fair cast of peroxide, not only on the lead surface, but penetrating somewhat into the plate, as described before, and pasting them afterwards, he had a rough porous surface for the paste to adhere to, and in forming the plates a second time to oxidize this paste higher he found that the two separate coats adhered together very satisfactorily. He found afterward, however, that no matter how thorough the mixture seemed to be, after a period of, say, one to two years, the pasted part fell out of the positive plates, but, as the current could not find more metallic lead when the paste had fallen away, the plate could not be injured, and that by this time the Planté formation had increased to such an extent that, in spite of having lost all the peroxide formed from the paste, it still retained its full capacity. In fact, we might now say he had obtained a perfected Planté plate. From this period the Tudor accumulator takes the lead as a satisfactory working battery.

In 1887 the "A. F. A." Company undertook the manufacture of the Tudor plate or accumulator for Germany, and from that time, year by year, there has been a steady improvement in the construction and formation of the plates, until this type of battery has reached its present high state of perfection. Many difficulties had to be encountered and overcome, not only in the plates themselves, but in the method of manufacture, in order to cheapen the cost of production. Electric accumulators are used far more largely in Germany than in any other country in the world. The annual production amounts to over £900,000 per annum.

It is interesting to note that between 1895 and 1897 a very big increase in the output of batteries took place. This was due to the perfection of the new, large surface plate at that time, improving the batteries so much that a large gain was effected in the sales. They succeeded in finding a method of forming the Planté plate in a very short time,

bringing its cost of manufacture down to a reasonable point. This was due to several years of hard investigation and experiment by the "A. F. A." Company. This plate is the one at present in use, and, without doubt, is the most perfect positive plate on the market. It may be of interest here to inform you that Dr. Nansen, on his Arctic exploration trip, took one of these batteries with him for lighting his ship, the Fram, and brought it back after three years' service in perfect order. This type of cell has been produced with capacities varying from 12 ampere hours to 25,000 ampere hours in one hour. Each individual plate of the latter has a capacity of 1,250 amperes. I may state here that a new method of soldering has just been introduced, by means of compressed gases, which reduces the cost and time required for soldering to about one-half of what it was formerly. I may mention a large order which we recently supplied in Berlin, consisting of seven batteries, each battery containing 280 cells, with an output of 5,328 amperes each for one hour. These batteries are connected up in parallel on the three-wire system, 140 cells in each row, making the output altogether for each 10,656 amperes per hour. Each cell of this big battery contains 165 gallons of acid. These batteries are giving the very best results.

The demand for electric accumulators is rapidly increasing, and up to the present time the "A. F. A." Company have sold over 12,000 batteries and are casting over 40 tons of lead per day. They make a special feature of the care and maintenance of the batteries after erection, and in this way obtain excellent results, which are certified to by testimonials from all parts of the world. From my preceding description of the chemical actions taking place within the battery it can be seen that the life and cost of maintenance depends almost entirely upon the care exercised in the operation of the battery. If the battery is worked within its rated capacity and clean, pure water and acid are used for filling the cells the results will be very favorable and the cost of maintenance low. If, on the other hand, the battery charge and discharge is carried to a point beyond that for which the particular size of plate is intended the life of the battery will be greatly decreased as the abnormal chemical actions taking place will quickly ruin the formation of the plates, causing rapid disintegration of the active materials. I cannot emphasize this fact too much, as a storage battery is not like a dynamo which will stand overload, limited only by the heating effect. It should be worked within the capacity for which it was intended. The instructions issued for the operation of these batteries by the manufacturing company are so simple that there should be no difficulty for an ordinary workman to care for the battery in such a manner as to give the best results. It is always well to inspect a battery regularly, say a few cells each day, in order to keep all in a uniform condition, rather than to wait for any trouble to make itself manifest in the working of the battery. In this way the time and expense of maintenance is reduced to a minimum.

San Juan's First Trolley Road.

Last week in San Juan de Porto Rico thousands of persons witnessed the starting of the new trolley system, the island's first road of that description.

An Isolated Residence Lighting Plant.

The use of electricity for lighting residences is extending rapidly of late years. Not only is this true, but the character of the electric installations for this purpose has improved steadily, until at present the equipments in some of our homes leave little to be desired in the way of perfection of design and installation.

To this class belongs the plant now operated by Mr. Archibald Rogers for light and power at his country home, situated at Hyde Park on the Hudson.

Electricity is used in this case, not only for the 400 lights in the residence and stable, but also for power, five motors ranging from $\frac{1}{2}$ to 2 hp. being used, some to pump water and others to operate tools in the machine shop.

The generator made use of is a shunt-wound machine of 200 amperes capacity, with a range in voltage from 100 to 150. This variation in voltage is required to charge the battery, since no booster is used. The generator is direct connected to a horizontal engine of 60 hp. capacity and 300 r.p.m. Steam is supplied from three horizontal return tubular boilers of 50 hp. each. These boilers also supply heat for the premises and steam for the laundry. A white Italian marble switchboard contains all instruments and switches necessary to operate the generator, battery and feeders.

The battery room and layout is one of the most perfect that has been constructed. It is built of stone to a distance of four or five feet above the ground, and from this point the walls are of heavy double frame construction. The numerous windows are connected to an iron rod, by means of which all can be opened simultaneously to permit of ventilation. The floor is of heavy stone flagging with Portland cement joints. In one corner is a drain leading into a 3" tile pipe.

The battery consists of 55 "Chloride Accumulator" cells of the Electric Storage Battery Company's type G-15, having a capacity of 1,200 ampere-hours at the normal rate. Each cell is composed of fifteen plates approximately 15 $\frac{1}{2}$ " square, suspended in lead-lined wooden tanks. The tanks are supported by glass insulators which rest upon wood stringers. These stringers are raised about six inches from the floor by wood supports spaced 40 inches. By this construction the battery is placed in one tier and is thus easily accessible. The aisles between rows are ample. The floor space occupied is 20x40'. The wiring to the battery terminals and end cells proceeds from the engine room in a 6" tile pipe, each wire being protected by a circular loom. In the battery room all the wire is run open upon porcelain insulators.

The switchboard is so arranged that the generator can supply light and power at the same time that it is charging the battery. When this is being done the pressure at the lights is kept at the normal 100 volts by cutting back on the battery by means of an end cell switch. When charged the battery can be used alone to supply light and power, or it can be thrown in parallel with the generator to assist it during hours of extreme load.

In this plant the storage battery has had a most complete test, extending over a long term of years. The operation of this plant is rendered most simple by the introduction of the battery. To charge each day it is necessary to run the engine from 7 A.M. to 12 M. only, and during the remaining nineteen hours the battery is discharged to supply lights and

power. The great advantage of such an arrangement in a residence cannot be overestimated, for it renders it possible to obtain light at any time of day or night without the necessity of running the engine plant more than five or six hours. Moreover, the period for operating the engine can be selected at a time most convenient to the man in charge. In truth, these facts are of such value that a battery in such cases is considered almost a necessity, and, as a result, there are but few plants being installed in residences without this auxiliary.

The Babcock & Wilcox Company's New Works.

With the beginning of the new century work was started in the new boiler works of the Babcock & Wilcox Company at Bayonne, N. J.

The engine was started at midnight, at the dawn of the new year, in the presence of the Mayor of Bayonne and a number of the city officials and the officers and heads of departments of the Babcock & Wilcox Company.

Operatives went to work at once in the drum shop, which is the first department to be put in operation, and in the presence of the guests a steam drum was completed out of the flat sheets. Those present witnessed all the operations of shearing, punching, rolling, riveting and assembling involved in its manufacture.

Supper was served to the guests and toasts were drunk to the success of the new plant.

The new works of the Babcock & Wilcox Company are located in Bayonne, where the company has purchased thirty acres of land, having a frontage of 650 feet on the Kill von Kull, with a depth of water 25 feet on the pier line.

The plant is the largest of its kind in the world. The buildings completed have a floor area of about 160,000 square feet, to which will be added at once buildings of approximately 40,000 square feet floor area.

The plant is equipped throughout with special tools, and has been designed with the greatest care to expedite the processes of manufacture by reducing to the last degree the needless handling of material and by the use of the most approved appliances.

The business of the Babcock & Wilcox Company is over thirty years established, beginning with the partnership existing between Babcock & Wilcox in the manufacture of engines in the early sixties. The first boilers were built by them in 1867. The partnership was changed in 1881 to the present corporation.

The works of the company have hitherto been located on grounds leased from the Singer Manufacturing Company in Elizabethport, N. J., but the enormous growth of the business in later years made necessary an increase in productive capacity and in 1899 the company decided to build the new works now nearing completion.

The site chosen is an ideal one. So large a tract of land with so desirable a water frontage close to New York City is exceedingly difficult to obtain, and in most instances such a manufacturing site can only be obtained by filling in soft marshes fronting on the water. The site occupied by the Babcock & Wilcox Company is remarkable in that it consists wholly of solid ground, no piling having been used for either the buildings or the heavy foundations required for the machinery installed.

A spur track from the Central Railroad of

New Jersey enters the property, so that the company enjoys the best of facilities for shipping both by rail and water.

The famous water-tube boilers manufactured by the Babcock & Wilcox Company have a world-wide reputation. The success of the water tube boiler dates from the first boilers of their manufacture. In addition to the enormous business which they are doing in stationary boilers the company have in the last few years entered into the manufacture of marine water tube boilers which are now extensively used in the United States Navy, are being introduced in the British Navy, and are very widely used in the merchant marine.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The New Westminster & Burrard Telephone Company of British Columbia, is looking into the question of establishing telephonic communication between Victoria and Nanaimo, B. C.

Mr. Geo. H. Collins, of Greenwood, B. C., has sold to Nelson capitalists all his interests in the Greenwood & Phoenix Tramway and the Phoenix Electric Light Company. The new owners purpose commencing operations in the spring on the tramway which is to connect Greenwood with Phoenix.

The council for the town of Lindsay, Ont., has approved of the submission to the ratepayers of the town, of a by-law authorizing the corporation to operate a municipal street lighting plant.

Messrs. Ely and Turner, of Warton, Ont., propose installing an electric light plant in that town, and have asked permission from the municipal authorities to erect poles and wires on the streets.

Mr. C. H. Mitchell, of Niagara Falls, Ont., has made an inspection of the source of power at the falls, for the waterworks, and at the power house of the International Traction Company with a view of devising some means of increasing the water power and preventing ice blockades. Two plans are favored, one to enlarge the intake and the other to build a submerged dam.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended January 2:

Amsterdam, 3 cases, \$176; Antwerp, 155 packages, \$13,576; Argentine Republic, 158 packages, \$6,389; 32 cases, \$2,990; Bristol, 3 cases, \$366; British East Indies, 24 cases, \$773; 19 packages, \$6,300; British West Indies, 12 cases, \$660; Brussels, 23 cases, \$769; Central America, 322 packages, \$1,161; Chili, 8 packages, \$259; Cuba, 68 cases, \$2,150; Genoa, 50 packages, \$8,844; Glasgow, 15 cases, \$508; 27 electrical cables, \$11,116; Hamburg, 55 packages, \$3,779; Havre, 4 packages, \$503; Liverpool, 17 packages, \$778; London, 24 packages locomobiles, \$7,500; Manchester, 26 packages motor trucks, \$1,200; 140 packages, \$22,063; Mexico, 47 packages, \$140; 9,411 packages electrical railroad material, \$14,439; 1 crate electrical machinery, \$80; 1 motor carriage, \$909; Milan, 20 packages, \$1,274; Naples, 12 cases, \$1,250; Peru, 20 packages, \$417; Rotterdam, 1 package, \$40; Southampton, 24 cases, \$1,073; St. Petersburg, 2 cases, \$106; U. S. Colombia, 3 cases, \$49; Venezuela, 157 cases, \$1,041.

PERSONAL MENTION.

Mr. H. F. Parshal, an American engineer interested in Charles T. Yerkes' projected underground electric railway in London, arrived in this city January 6 from Liverpool. He said he came to place with American firms a large order for railway supplies needed in Great Britain.

Mr. C. Taylor Leland was recently elected president of the Quakertown (Pa.) Traction Company.

Mr. Frank Hibbard was recently appointed superintendent of transportation of the New York and Queens County trolley system, taking the place made vacant by the retirement of George H. McDonnell.

Mr. Robert H. Forderer has been elected president of the Keystone Telephone Company of Philadelphia, to succeed Alexander Balfour, who will retain his place in the board of directors.

Mr. Everett Frazar, who represented the Korean Government in the United States, died January 3 at Orange, N. J. Mr. Frazar established the mercantile firm of Frazar & Co., which is still in existence in Shanghai, China. Of late years this firm has been actively engaged in the introduction of electric lighting in Japan and China.

INCORPORATIONS.

The San Bernardino Gas & Electric Company, San Bernardino, Cal. Capital stock, \$200,000. Directors: C. R. Lloyd, W. S. Hoper, E. D. Roberts, W. F. Jordan and J. W. Curtis.

The Hinton Electric Light, Ice & Fuel Company, Hinton, W. Va. Capital stock, \$100,000. Incorporators: J. Leslie, F. W. Gilbert and others.

The New Martinsville Ice & Electric Company, New Martinsville, W. Va. Capital stock, \$15,000. Incorporators: J. Scally, G. B. Woodcock, C. Beck and others.

The Consolidated Ice & Electric Company, Cambridge, Ill. Capital stock, \$100,000. Incorporators: P. C. Patterson, H. O. Barber, Charles S. Tumbough, John L. Locke and Y. H. Bevington.

The Florida Peninsular Transportation Company, Tampa, Fla.—to build and operate an electric railroad from St. Petersburg on the western coast to Tampa, and will maintain several water lines of transportation. Capital stock, \$1,000,000.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JANUARY 1, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

664,863. Fender for Cars, etc. George Hipwood, Boston, Mass. Filed June 9, 1900.

664,992. Trolley for Electric Railways. Louis d'Orville Chabut, Pittsburg, Pa. Filed June 14, 1900.

665,051. Electric Traction. Samuel G. Bennett, Wolverhampton, Eng. Filed Oct. 13, 1900.

665,094. Means for Electrical Car Propulsion. John H. Hertner, Cleveland, O. Filed Aug. 6, 1900.

665,248. System of Electric Traction. Lowell M. Maxham, Boston, Mass. Filed April 28, 1900.

665,869. Trolley. Hermann Lachenmeyer, Dusseldorf, Germany, assignor to Commanditgesellschaft Spiegel, Nacken & Co., Cologne, Germany. Filed Feb. 20, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

664,971. Incandescent Lamp. Edward Riordan, New York City. Filed April 5, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

664,907. Electric-Elevator Controller. Barrington S. Stephens, New York City, assignor to the Electrical Appliance Company, Jersey City, N. J. Filed March 17, 1899. Renewed May 24, 1900.

664,948. Electric Meter. Caryl D. Haskins, Newton, Mass., assignor to the General Electric Company of New York. Filed July 29, 1899.

664,969. Electric Motor for Railways. Edward D. Priest, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 30, 1897.

664,986. Electric Switch. George H. Whittingham, Baltimore Md. Filed March 19, 1900.

665,087 665,320. Controller for Electric Motors. Frank W. Garrett, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Sept. 25, 1900. March 26, 1900.

665,127. Controller for Electric Motors. George H. Parmelee, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed July 25, 1900.

665,133. Electrical Valve-Controller. Clarence B. Riggs, New Rochelle, N. Y. Filed Feb. 3, 1900.

665,139. Control of Electric Motors. Bennet C. Shipman, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Original application filed Aug. 5, 1899. Divided and this application filed May 29, 1900.

665,143. Control of Electric Motors. Emmett W. Stull, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed June 5, 1900.

665,144. Controller for Electric Motors. Emmett W. Stull, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed June 16, 1900.

665,156. Double-Pole Switch. Robert E. Wood, Baltimore, Md. Filed Aug. 28, 1900.

665,305. Electrical Transformer. Arthur F. Berry, London, Eng. Filed July 23, 1900.

665,318. Electric-Motor Controller. Frank W. Garrett, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Aug. 24, 1899.

665,322. Safety Device for Electric-Motor Controllers. Frank W. Garrett and George H. Parmelee, Johnstown, Pa., assignors to the Lorain Steel Company of Pennsylvania. Filed June 16, 1900.

665,324. Means for Controlling Electric Motors. John Green and George C. Thom, Johnstown, Pa. Filed June 15, 1900.

665,337. Electric-Railway Motor. Frank A. Merrick, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Dec. 30, 1899.

665,350. Electric-Motor Control. Bennet C. Shipman, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Aug. 5, 1899.

TELEPHONES AND TELEPHONE APPARATUS.

664,904. Microphone. August H. Skold, Stockholm, Sweden. Filed Dec. 22, 1897.

664,941. Telephone Attachment. George W. Ganoe, Phillipsburg, Pa., assignor, by direct and mesne assignments, of two-thirds to William C. Prickett and John S. Furst, Williamsport, Pa. Filed July 2, 1900.

665,134. Telegraph or Telephone Call Mechanism. Edgar E. Salisbury, Chicago, Ill., assignor to the National Automobile Company, same place. Filed March 21, 1900.

665,251. Mouthpiece for Telephone-Transmitters. Winfield S. Moore, Indianapolis, Ind. Filed May 21, 1900.

MISCELLANEOUS.

664,865. Burglar-Alarm. James H. Howard, Kansas City, Mo., assignor to the Howard Electric Company, same place. Filed Oct. 5, 1899.

664,868. Electrically-Operated Cut-Off Valve for Engines. Louis Johnson, Milwaukee, Wis., assignor of one-half to Albert C. E. Icke, same place. Filed Nov. 18, 1899.

664,869. Electric-Wave Telegraph. Warren S. Johnson and Charles L. Fortier, Milwaukee, Wis., assignors to the American Wireless Telegraph Company, same place. Filed Feb. 16, 1900.

664,915. Electrical Device for Determining the Resistance or Conductivity of Bodies. Henry E. Warren, Newton, Mass. Filed Jan. 27, 1896.

664,953. Electrical Resistance-Board. Willis R. King, Newark, N. J., assignor to the Hanson & Van Winkle Company of New Jersey. Filed July 21, 1900.

664,966. Electrothermostatic Cable for Fire-Alarms. Adolph Munker, Schoeneberg, Germany. Filed April 14, 1900.

665,027. Printing Telegraph. Henry Mahnen, New York City. Filed March 8, 1900.

665,040. Automatic Fire-Alarm. Albert R. Thompson, Indianapolis, Ind., assignor of two-thirds to Clarence M. Zener and John Wocher, same place. Filed Sept. 22, 1899.

665,064. Electrolytic Cell. Edwin D. Chaplin, Winchester, and Henry G. Halloran, Boston, Mass. Filed May 29, 1899.

665,065. Fuse-Holder. Warren R. Cook, Pittsburg, Pa. Filed April 18, 1900.

665,186. Electric Shuttle-Motion for Looms. John M. Cryer and William E. Bullen, Poulton-le-Fylde, Eng. Filed Sept. 4, 1900.

665,195. Storage Battery. Aubrey G. Eneas, Boston, Mass. Filed Oct. 9, 1897. Renewed June 13, 1900.

665,319. Alarm Device for Armature Shafts. Frank W. Garrett, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Sept. 16, 1899.

665,321. Method of Controlling Electric Motors. Frank W. Garrett, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Original application filed Aug. 24, 1899. Divided and this application filed March 26, 1900.

665,352. Electric Fuse-Box. Emmett W. Stull, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed March 21, 1900.

665,362. Driving Mechanism for Dynamos. William L. Bliss, New York City, assignor to the Bliss Electric Car Lighting Company, East Orange, N. J. Filed April 2, 1900.

DESIGN.

33,823. Casing for Arc-Lamps. Allyn B. Walton, Lorain, O., assignor to the National Vapor Stove & Manufacturing Company, same place. Filed Dec. 5, 1900. Term of patent 14 years.

THE TELEPHONE WORLD.

Erie Telephone Company's Affairs.

A dispatch from Boston says: "A circular has been issued by the Erie Telephone & Telegraph Company, announcing that to meet a floating indebtedness of \$6,000,000 coming due within the next eight months, and to provide for necessary improvements, it was proposed to issue \$7,500,000 in one-year notes, bearing 5 per cent. interest. It is said that the note issue will be financed by the Old Colony Trust Company of this city, on behalf of a bankers' syndicate, and that in order to accomplish this it was necessary for the Telephone, Telegraph & Cable Company of America to part with a large part of its holdings of Erie stock, which aggregated \$10,000,000. The transfer of the controlling interest in the Erie Company is not denied by the officials, who say that while the Boston syndicate has obtained a managing interest, the change will not affect the Erie Company nor its subsidiary interests."

A special meeting of the Erie Telegraph & Telephone Company will be held at 100 Broadway, New York, to-day, January 9, for the purpose of authorizing the directors to mortgage the property to secure the payment of obligations, or of debt contracted in transacting the company's business.

From Charleston, S. C., comes the report that the independent telephone companies are bringing big opposition to the Bell Company, and the State system will cover a rich territory. The ten new companies that have been chartered have an aggregate capital stock of \$767,500. They are as follows: Sea Island Telephone Company and Island Telephone Company, Charleston, \$10,000 and \$4,000, respectively; Ashworth Electrical Company, Chesterfield, \$100,000; Georgetown & North Island Telephone Company, Georgetown, \$1,000; Ninety-six Telephone Company, Greenwood, \$1,000; Blenheim & Brownville Telephone Company, Marlboro, \$500; Consolidated Telephone Company of South Carolina, Richland, \$100,000; South Carolina Long Distance Telephone Company, Richland, \$500,000; Glenn Springs Telephone Company, Spartanburg, \$500; Citizens' Telephone & Telegraph Company, Spartanburg, \$50,000.

The first of last year the rates of the Forman, N. D., Telephone Company were \$2 for business and \$1.50 for residence telephones. During the past summer the Wahpeton and Lisbon exchanges in that State, the only exchanges owned by the company, have been practically rebuilt, and the rates now are \$2 for business telephones, \$1.50 for single lines to residences, and \$1 per month for party lines, two on a line. The rates therefore for business telephones have not been raised, and instead of being dissatisfied the subscribers are having the best service they ever had. This is evidenced by the fact, says Robert Hannah, secretary of the company, that the number of subscribers is increasing every week.

The Texas Railroad Commission, in its annual report, which was filed with Gov. Sayers a short time ago, makes several recommendations for the enactment of laws extending its powers over railroads and other common carriers within the State. It also recommends the enactment of a law giving it authority to regulate the rates and charges of all telegraph and telephone companies doing business in the State, and to compel all such companies to maintain general offices in the State.

Assemblyman Sanders of Manhattan will introduce a bill regulating telephone tolls in New York City. The exact figure for rentals has not been decided upon yet, but sweeping reductions may be anticipated from this statement of the Assemblyman: "I believe the people of New York have been too long robbed by the telephone monopolies and I intend to try and effect a radical change."

The Colesville, N. J., telephone project is now moving along slowly, but surely. Nearly every one in the upper end of the township is now interested, and there is a possibility that the line will be continued to Port Jervis, N. Y. It will prove a great convenience to the people along the route.

A representative of the Wisconsin Telephone Company has again visited Marshfield, Wis., for the purpose of making overtures for admission of a line. He states that the company is now willing to come into the city and agree in writing to operate a long distance line only.

The Mutual Telephone Company will shortly establish a local exchange in East Des Moines, Ia. The board of directors at its next meeting will be asked permission to lay a cable of twenty wires to the east side and establish the exchange with a capacity of 600 wires.

The South Shore Telephone Company has its service in operation in Sea Cliff, N. Y. Nearly fifty subscribers are enrolled.

Reduction of Telephone Rentals.

The Southern New England Telephone Company recently announced a general reduction of telephone rentals in all exchanges in Connecticut where the number of subscribers is less than 100. The cut is an important one and effects 15 towns and 1,500 subscribers.

The present rates for party service, covering the town in which the exchange is located, makes the charge for domestic or house service \$24, and for business purposes \$30, with somewhat higher rates for adjoining towns embraced in the exchange, according to the distance from the exchange to the center of the town.

The new rate for party line service will be \$18 per annum for domestic or house service, a reduction of 25 per cent., and \$24 for business service, a reduction of 33 1/3 per cent., with a corresponding reduction for adjoining towns.

The exchanges affected by the reduction are Branford, Danielson, Guilford, Litchfield, Manchester, Milford, Naugatuck, New Milford, Ridgefield, Rockville, Southington, Saybrook, Simsbury, Wallingford and Winsted and their connecting towns.

A Rival of the Bell Telephone Company.

The Interstate Telephone Company is engaged in constructing long distance lines connecting in the first instance towns in Eastern Pennsylvania and New Jersey, and later it is expected the cities of New York and Philadelphia. The line from Trenton to Hazleton will soon be completed and the link between Hazleton and Wilkes-Barre, with but a single pair of wires for the present, has just been opened for business. The local line between Wilkes-Barre and Hazleton in contemplation by the People's Company cannot be built for a considerable time, but in the meantime the Interstate Company at a moderate charge will take messages through the People's Company exchange.

When a telephone line is installed by the side of an electric trolley road the influence exercised by the trolley upon the telephone is disturbing to the telephonic connection, the noise caused by the passing of the cars being distinctly heard. Experiments recently made at Basel, in Switzerland, with the object of finding a remedy, have conclusively demonstrated that the only practical solution is to entirely insulate the telephone by employing a return. In Switzerland, where most all the telephonic connections are on single wire, it would cost about \$5,000,000 to make this change.

Telephone service at Purcell, Indian Territory, is being improved by the putting in of new switchboards with 100 drops, and a new cable into the exchange. Long-distance service in every direction is already available, connections with Missouri River points is in sight, and there is a demand for the connecting of the local circuit with the long distance lines.

Representatives of the independent telephone companies of Columbiana County, recently met at Salem, O., and organized the Columbiana County Independent Telephone Association. The Columbiana County, the Eastern Ohio, the Damascus and the Winona Companies were represented.

The Plymouth, Wis., Telephone Exchange has been incorporated as a stock company. The following have been elected directors: B. W. Rowe, Henry Timm, H. W. Hostman, Charles Pfeifer and Dr. Frank Derrwaldt. The city council has granted the company a franchise to construct and maintain a system.

The local telephone company of Hamburg, N. Y., has added a line to East Eden, N. Y., and made connections. It will add a line to Eden Center, which will be in readiness shortly. The company also contemplates a service at West Seneca, N. Y. The local organization has about one hundred patrons although it has been in existence about a year.

The Southern New England Telephone Company, says a Waterbury, Conn., paper, is considering a practical system of duplexing telephone wires, by which, using an auxiliary telephone, conversation with two persons may be held simultaneously on the same wire.

The Fox River, Wis., Valley Telephone Company has complied with the terms of its franchise, and a toll line system is now in operation in that city.

The Monrovia, Cal., Telephone Exchange is extending its lines, and Duarte in that State is to have the benefit of the service.

An accidental fire in the telephone exchange at Brunswick, Ga., has completely crippled the Southern Bell service.

London's Great Central Exchange.

At the Great Central Exchange in Queen Victoria street, London, the switchboard, which will accommodate many thousands of renters, is being put together rapidly. The switchboard is a triumph of the electrician's mechanical skill, the simplest and most effective that has yet been manufactured, and will prove a great public boon.

London has been much in need of it, for the present telephone system is very trying to the tempers of business men, and the operators have a terribly heavy time. It will be quite a treat to ring up the exchange and not get the vexing reply, "Engaged; ring again, please," meaning, of course, that some other exchange through which your message has to pass is blocked at the time.

People are, therefore, looking forward with no little impatience to the new Post Office 'phones, which will simplify matters so much.

On this new system, so far as the caller is concerned, all that one will be required to do will be to take up the telephone receiver, and the exchange officials will do the rest.

To dispense with technicalities, it may be stated that the act of taking up the 'phone sets in motion a delicate electrical system, in which colored visual signals play a most important part, and the caller is placed in communication with the number he requires.

The signals indicate to the officials when the persons using the system have finished their conversation.

The board of public works of Louisville, Ky., at a recent meeting decided to put up the franchise for a new telephone system at auction on Monday, January 28, at 12 o'clock. The franchise will be sold to the highest bidder. No bid under \$10,000 will be entertained.

The Interstate & Herkimer County Telephone Companies having connected their lines there is now an independent telephone system extending from Amsterdam to Syracuse, N. Y., besides lateral branches.

A number of citizens of Owingsville and Wyoming, Ky., have subscribed sufficient stock to run a telephone line between the two places mentioned. Work on the same will begin at once.

The transfer from the old to the new switchboard of the Port Huron, Mich., Telephone Exchange was recently completed. The city now has one of the most modern plants in the country.

The Belmont Telephone Company of Bridgeport, W. Va., is rapidly completing its work and will soon be ready for operations.

The city council of Temple, Tex., has granted a franchise to Messrs. Boynton and Earle of Waco for a telephone exchange.

A double switchboard is to be placed in the local telephone exchange at Le Roy, N. Y.

The Sunset Telephone Company is preparing to put in a telephone line from Grant's Pass to Williams, Ore.

The Zenith Telephone Company, the anti Bell Company of Minneapolis, Minn., now has 1,330 'phones in use.

There is much dissatisfaction in New Decatur, Ala., with the telephone service of the Bell Company.

The Keystone Telephone Exchange at Norristown, Pa., was destroyed by fire recently.

TELEPHONE INCORPORATIONS.

The Maryland and Delaware Telephone & Telegraph Company, Baltimore, Md.—to maintain and construct telephone and telegraph lines. Capital stock, \$50,000.

The Steuben County Telegraph & Telephone Company, Bath, N. Y. Capital stock, \$2,000. Directors: J. S. Bowley and W. D. Carroll, Bath; D. F. Ward, Savonia.

The Interior Telephone Company, Cedar Rapids, Ia. Capital stock, \$10,000. Incorporators: E. J. C. Bealer, J. M. Restein, E. E. Wood and W. Hubbard.

The Bath and Cameron Telephone Company, Bath, N. Y. Capital stock, \$400. Directors: Albert Crandall, A. J. Annabel and A. C. Annabel, all of North Cameron.

The Telephone Company of America, Washington, D. C.—to manufacture telephones and telephone supplies and to operate machine shops and foundries. Capital stock, \$5,000,000.

GENERAL ELECTRICAL NEWS.

Lighting.

Ashkum, Ill.—The citizens of this place are considering the question of putting in electric lights.

Baker City, Ore.—An electric light plant capable of furnishing power and light for a region of six miles in diameter is being talked of in this city.

Barberton, O.—The voters of this village will on January 24 vote on the question of erecting a new power plant. O. C. Barber proposes if the vote be favorable to erect a plant to cost about \$150,000 for light and power.

Buffalo Lake, Minn.—The citizens of this place are agitating the question of erecting an electric light plant.

Canton, Ga.—Capt. T. M. Brady is making preparations for placing an electric dynamo and plant in the Georgia Marble Furnishing Works at this place, of which he is owner and general manager.

Central City, Neb.—This city is considering the advisability of purchasing an electric light plant.

Charlotte, N. C.—Hayden, Wheeler & Schwend of this city want bids on the best gas and electric lighting plant for an office building.

Elnora, Ind.—Dr. J. C. Mitchell, of Odon, was recently here conferring with the town council with reference to erecting an electric light plant.

Fremont, Neb.—The electric light works owned by this city are becoming inadequate, and the building of a new plant is being agitated.

Homer, La.—The citizens of this place are agitating the question of erecting an electric light plant.

Livingston, Mont.—M. Roth is interested in the establishment of a new electric light plant here.

Louisville, Ga.—The council proposes to put in electric lights soon.

Lumberton, N. C.—This city will soon hold an election to decide upon the issuance of \$5,000 of bonds for the construction of an electric light plant.

Montevallo, Ala.—The Legislature has appropriated \$100,000 for completing the electric light plant at the Girls' Industrial School.

Muskegon, Mich.—The stockholders of the Muskegon Electric Light Company have authorized the sale of the plant to Liddon Flick and T. S. Barber of Wilkes-Barre, Pa. Extensive improvements will be made including the consolidation of the power houses. The light company is capitalized for \$65,000.

North Amherst, O.—The citizens will on January 14 vote on the proposition to issue \$15,000 in bonds to build an electric light plant.

Nicholasville, Ky.—This city is considering an issuance of bonds for the erection of an electric light plant.

Renville, Minn.—The citizens of this place are figuring on an electric light plant.

Richmond, Ky.—The Richmond Water & Light Company is arranging for the erection of an electric light plant.

Rockingham, N. C.—This city will petition the Legislature for authority to issue bonds for the erection of an electric light plant.

Rocky Mount, N. C.—This town will apply to the Legislature for privilege to issue bonds to the amount of \$40,000 to put in a sewerage system, erect an electric light plant, and finish the waterworks system.

San Jacinto, Cal.—The city council contemplates the erection of a new electric light plant.

Scotia, Cal.—W. V. Lockwood, representing San Francisco capitalists, is making arrangements to establish an electric light plant here for supplying the valley towns with light and power.

St. Michaels, Md.—This city will erect an electric light plant.

Texarkana, Ark.—The electric light plant here was recently destroyed by fire. The loss was about \$15,000, insurance, \$9,000. Another plant is under course of construction and will be completed in about thirty days.

Tulahoma, Tenn.—The question of establishing an electric light plant is again being agitated, and will doubtless take form within the next few weeks.

Wellsburg, W. Va.—The Wellsburg & Wheeling

Railway Company will establish a plant to furnish electric lights, heat and power to consumers.

Westfield, N. Y.—At a recent meeting of the board of village trustees it was voted to purchase new machinery for the electric plant, sufficient to increase the capacity of the plant 2,000 incandescent lights.

Wilkes-Barre, Pa.—Capitalists of this city, who are about to purchase the Shenandoah electric light and gas plants, are also sure of the Mahanoy City plants, and will build a line between the two towns to light the intermediate hamlets, including St. Nicholas and Gilberton.

Street Railways.

Brooklyn, N. Y.—The Brooklyn Rapid Transit Company will expend about \$3,000,000 in building a new 40,000 horse power motor plant, which is to be erected in South Brooklyn.

Chagrin Falls, O.—The Chagrin Falls & Eastern Electric Railroad Company has increased its capital stock from \$300,000 to \$500,000.

Columbus, O.—New York capitalists are securing the right-of-way for an electric railway from this city to Toledo. This road will be a direct line from here to Tiffin. It will be the third-rail system, and cars will run about 50 miles an hour.

Galveston, Tex.—C. E. Hotchkiss, purchaser of the Galveston City Railroad, will expend about \$200,000 in re-equipping and improving its power system, etc.

Greenwich, Conn.—The warden and burgesses of the town recently filed their permission to the Greenwich Tramway Company to lay tracks for a trolley system.

Hagerstown, Md.—The Hagerstown Electric Railway will be extended to Beaver Creek, Mapleville, Boonsboro, Keedysville and the Antietam battlefield.

Hellertown, Pa.—The contract for the building of the trolley line from Richlandtown to this place, a distance of ten miles, has been signed, and work will soon begin. With the closing of this link there will be a continuous trolley road from North Wales to Allentown.

Huntington, Ind.—The city council has agreed to grant a franchise to the Ft. Wayne & Southwestern Electric Road. The line will also be built to Warren in the southeastern part of the county.

Lisbon, O.—The last right-of-way has been secured for the projected electric railway from here to East Liverpool by way of Pleasant Heights.

New York City.—The New York Railroad Commission is to give a hearing on January 25 to the Buffalo, Rochester & Niagara Falls Railroad Company's application for permission to construct an 80-mile trolley railroad, which will practically parallel the New York Central Railroad.

Ravenna, O.—A new electric railway will probably be constructed between Akron and this place. The road will pass several lake resorts in this section of the country.

Reading, Mass.—Col. Woodward is to build a new electric road, with the latest modern equipment, from here to Wakefield Center out through Montrose to Mansfield's Corner at South Lynnfield.

Saco, Me.—A petition for articles of association was lately filed with the railroad commissioners for the Saco valley electric railway, beginning and running through this place and Buxton to Bonney Eagle, in the town of Standish. The directors named are Harry A. McNeally, James O. Bradbury and William J. Maybury, all in Saco. Francis S. Hobart, of Braintree, Mass., and Ebenezer B. Loring, of Boston. The capital stock is \$250,000 and the length of the proposed road 20 miles.

South Charleston, O.—Application will soon be made to the board of county commissioners for right of way between Springfield and this city for the construction of an electric railway. L. H. and E. Houston are the promoters.

Taylorville, Ill.—D. M. Sharp contemplates the construction of an electric railway from Grove City and Mt. Auburn to this place.

Toledo O.—The Toledo, Fremont & Norwalk Electric Road inaugurated its freight system a short time ago.

Manufacturing.

Bridgeport, Conn.—The Cahill Electric Typewriter Company of Washington, D. C., is to locate in this city. The company makes a typewriter which uses electricity to operate the letter, a slight pressure on the key being all that is required.

Chicago, Ill.—Jacob Zaun, W. H. Wisler, and Matthew Stotter are interested in the Liberty Incandescent Light Company, which has been formed to manufacture lighting and heating apparatus on a capital of \$2,500.

Ft. Wayne, Ind.—It is the intention of the Belden-Larwill Electric & Manufacturing Company to further enlarge the plant and engage in the manufacture of dynamos and transformers. Mr. Gustave Hackins now has charge of the office.

Los Angeles, Cal.—The manufacture of insulated wire will be begun in this city February 1. The officers of the company are Wallace L. Hardison, president; Guy L. Hardison, vice-president; Frank Taylor, secretary, and Lewis W. Andrews, treasurer.

Company Matters.

Columbus, O.—The Columbus, Winchester & Lancaster Traction Company was granted a franchise a short time ago by the county commissioners. T. Simons is president of the company.

Richmond, Va.—The Richmond Traction Company has awarded to the American Car Company of St. Louis the contract to build for it 51 modern summer cars. The cost of these cars range from \$875 to \$1,175 each.

Zanesville, O.—The Southeastern Ohio Black Diamond Belt & Terminal Company of this city has changed its name to the Black Diamond Traction Company.

Power and Transmission.

Idaho Springs, Col.—The Idaho Springs Electric Light, Power & Heating Company, composed of local capitalists, is said to be contemplating additions amounting to about \$50,000 to its plant, and it is reported that a new modern plant will be erected by the company at an early date.

Philadelphia, Pa.—Capitalists of this city have under consideration a plan to employ water power as a substitute for steam in the production of electricity. It is proposed to utilize the waters of some accessible river and transmit the electricity by cable to this and other cities for electric railways, lighting and power supply. Officials of the Union Traction Company and the Philadelphia Electric Company discussed the feasibility of the plan and a representative is now investigating it.

Richmond, Va.—It is expected that the large power plant of the Virginia Electric Railway & Development Company in this city will be in operation by March 1 at the latest.

Winston, N. C.—The practical reorganization of the North Carolina Electrical Power Company has taken place. This company is developing the water power of Ivy River near Asheville. Messrs. J. S. Carr, of Durham; Capt. H. R. Lemly, of Washington City; J. A. Vance and Spach Bros. of Salem, are among the stockholders.

Automobiles.

Boston, Mass.—The electric busses recently tried on the streets of this city have proven a success.

Occoquan, Va.—It is understood that the Virginia Automobile Company will locate its factory on the creek near here, and take advantage of the splendid water power to run its machinery.

Providence, R. I.—The first meeting of the Rhode Island Automobile Club, which was recently organized, was held last week in this city, and the following officers were elected: Dr. Julian A. Chase, president; H. A. DuVillard, vice-president; R. Lincoln Lippitt, treasurer; Frederick C. Fletcher, secretary.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16% @ 16 1/2c.; Lake, 16% @ 17c.; casting, 16% @ 16 1/2c.

The Detroit street railways have been consolidated under the name of the Detroit United Railway Company with a capital of \$12,500,000.

The Connecticut Lighting & Power Company of Waterbury has filed in the State Secretary's office a certificate of increase of capital from \$1,000,000 to \$15,000,000.

All obstacles to the merger of the People's Electric Light & Power Company of Newark, N. J., and the United Electric Company of New Jersey are said to have been removed.

During the fiscal year ended December 31 Philadelphia Electric earned a surplus of \$100,000 over interest charges. This, present year, with reduced interest charges, there should be shown a balance of \$180,000.

An official of the Metropolitan Street Railway Company of New York says he understands that the entire issue of \$7,000,000 worth of stock has been taken by the stockholders at 160, the price at which it was offered.

The Chicago Metropolitan West Side Elevated Railway Company reports for the ten months ended December 31 (December estimated): Gross earnings, \$1,199,974; operating expenses, \$518,040; surplus, \$681,934; total surplus, \$684,916.

A dispatch from Boston states that the control of the Erie Telephone & Telegraph Company has passed from the hands of the Telephone, Telegraph & Cable Company of America to a syndicate represented largely by capitalists of that city.

Manager Emmons of the General Electric Works on January 1 issued the following statement: Number of hands employed December 31, 1900, 7,350; amount of weekly pay roll, \$97,000; net amount of business for the year 1900 about \$27,000,000.

Statements have been made that negotiations are now pending to consolidate the Kingston City Railroad and the Colonial Railroad of Kingston, N. Y. The officials of both roads have refused to confirm the statements at present, although considerable credence is given to the report.

The New York Railroad Commission will give a hearing in Albany on January 25 to the Buffalo, Rochester & Niagara Falls Railroad Company's application for permission to construct an 80-mile trolley railroad, which will practically parallel the New York Central Railroad. Subsequent hearings also will be given along the proposed line's route of construction shortly after the hearing in Albany.

The consolidation of the Boston Electric Light Company and the Edison Illuminating Company is to be effected by the leasing of both companies by a syndicate, represented by J. P. Morgan & Co., upon a rental equal to 10 per cent. on the stocks. The syndicate will form a new organization with a capitalization of \$3,650,000. Stockholders of both companies will be allowed to subscribe for stock in the new company at par.

Much speculation is going on in financial circles generally, says the Philadelphia "Stockholder," as to the future course of Brooklyn Rapid Transit in the market. Some argue that the price of the stock has advanced plenty far enough, while others claim that a much higher level will be established and probably maintained. The latter opinion seems the more reasonable and is shared by those in position to know the company's condition and plans.

The Boston "News Bureau" says: "We understand that the attempt to bull Amalgamated Copper has been abandoned for the time being. The interests which tried to advance the stock have sold some of their holdings and say they are willing to let the remainder stand as investments pending the adjustment of difficulties in Montana. It is supposed that the Montana Legislature will try to enact an eight-hour day in the mines. Whether this will be accepted by mining interests or will result in closing down of mines remains to be seen."

The report that the Raritan Traction Company has secured from the Freeholders of Middlesex County, N. J., the right to extend its lines to New Brunswick has been confirmed. Thus the company obtains connections with the Consolidated Traction Company of New Jersey, and is enabled to run from Perth Amboy to Jersey City by trolley. The Raritan Traction Company is a consolidation of the Perth Amboy Railroad and the Raritan Trolley Company, and is owned by New York capitalists. Leonard Lewisohn is president of the company, C. J. Wittenberg vice-president and J. C. McCoy secretary and treasurer.

A mortgage for \$50,000,000 was filed on Friday in the Westchester County Register's office at White Plains, N. Y. The mortgage is given by the Third Avenue Railroad Company to the Morton Trust Company of New York and covers the following lines: Union Railway Company, Forty-second Street, Manhattanville, St. Nicholas Avenue, Dry Dock, East Broadway & Battery, Kingsbridge, Yonkers, Westchester Electric, Southern Boulevard & Tarrytown, White Plains and Mamaroneck Railways. The instrument is dated May 15, 1900, and is due May 15, 2000. It is said the money raised for this mortgage is for general construction purposes and improvement of the road and its consolidated lines.

A dispatch from Minneapolis states that the gross earnings of the Twin City Rapid Transit Company for December showed an increase of 10.11 per cent. over the corresponding month in 1899. For the fiscal year, which ended December 31, the percentage of increase is 13.62 per cent. The earning capacity since the beginning of 1900 seems to be increasing, for the daily gain over the previous year has averaged \$800. For the three months ended November 30, which are regarded as average months, the surplus over fixed charges and dividends on the preferred stock was \$220,000. If this average is sustained the company should be able to earn a surplus of \$880,000 in the current fiscal year, equal to 5.86 per cent. on the common stock.

ELECTRICITY.

VOL. XX.

NEW YORK, JANUARY 16, 1901.

NO. 2.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4241 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, ...	\$2.50
IN CLUBS OF FIVE OR MORE, ...	2.00
FOREIGN COUNTRIES, ...	4.50
SINGLE COPIES, ...	10 cents

Sent by Express, Money Order, Draft, Post Office Order or
Registered Letter.

ADVERTISING RATES.

As *ELECTRICITY* reaches all classes interested in electrical
work, its value as an advertising medium can be readily un-
derstood. Rates will be sent on application.
Changes of advertisements should reach the office not later
than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

The Monroe Doctrine in Trade.

The rapid growth of man-
ufactures in the United
States has lately claimed
universal attention and
caused no small amount
of jealousy from the manufacturing centers
of the old world.

An anomaly is noticed in our nation employ-
ing comparatively higher priced labor, and car-
rying her products to Europe and securing
trade at the doors of old established factories
in open competition.

This anomaly is not only very plainly evident
along well established lines of trade, but in
the newer and lately developed lines of work,
this fact is most prominently noticeable, and
to particularize further, the electrical, and its
allied manufacturing industries, above all
others stand pre-eminent in international com-
petition, and we may almost say above this com-
petition, for even the European birth places of
the electrical sciences have been almost uni-
versally invaded by the highly practical and
economically constructed machinery of Ameri-
ca's electrical designers, and in so pronounced
a manner as to leave no doubt at this time in
the minds of the Central and South Americans
and the inhabitants of the West Indies, as to
the desirabilities of our electrical products for
their own countries. The outlying countries
of our own hemisphere are virgin territories
for these newly developed products. They are
the new fields to be developed and being com-
paratively close to our own doors we have an
undeniable advantage for the future. Here
our growing shipping interests are finding a
steady development.

Our export trade has heretofore found its de-
velopment along the parallels of latitude,
henceforth it will be along the lines of longi-
tude. The great prestige secured in the form-
er, will now more rapidly help us in our trade
in the latter direction.

If the Monroe doctrine in international poli-
tics is well recognized, the same doctrine in
trade, with our present facilities, will give us
nearly a commercial monopoly in virtue of
price and quality alone.

The same well directed efforts which have
secured us our present success, will give us an
unassailable position in the Southern countries;
but the difficulties to be encountered in these
new fields are somewhat different, and with

which we have had little experience. The edu-
cated European engineer and trader almost
always knows the English language well
enough for commercial purposes at least, but
our Southern friends must transact their busi-
ness in the Spanish or Portuguese languages;
our manufacturers have not as yet given this
matter the serious attention it demands.

Descriptive matter and price lists, and pre-
ferably also correspondence, should be in Span-
ish to secure merited attention. This is a mat-
ter our commercial German cousins have well
recognized and they have greatly profited there-
by. Their salesmen also are well equipped
with a knowledge of Spanish.

Until quite lately it has been difficult to se-
cure reliable commercial ratings in Southern
countries, which has been a serious difficulty
for our exporters, but the extensive systematic
efforts in this direction are rapidly becoming
reliable and banking facilities are increasing,
while the money system of the United States
is well understood throughout the American
Spanish speaking countries.

We have only to solicit this trade to secure
it, and *ELECTRICITY* through its export edi-
tions now offers its facilities.

* * *

A Submarine System of Wireless Telephony.

In the issue of *ELEC-
TRICITY* of July 26, 1899,
there appeared a de-
scription of an electri-
cal device invented by
an Italian professor,

which had for its object not only the prevent-
ing of collisions between vessels at sea, but the
detection of the approach of torpedo-boats in
naval warfare as well. This invention was
based on the principle of the telephone, a deli-
cate diaphragm being submerged to receive
the sound waves which passed through the
water. Commenting on the device at the time
we stated that it would seem to have great pos-
sibilities provided a sufficiently sensitive dia-
phragm capable of vibrating under water had
been obtained. It now appears that Prof.
Elisha Gray has also been quietly working along
this same line and has only recently perfected
a system of signaling, using the water as the
transmitting medium for which great things
are hoped. Prof. Gray's invention differs con-
siderably from that of the Italian professor.
In practice the former proposes to make use of
a submerged bell, operated electrically. The
bell may be lowered through a well hole in the

boat or it may be suspended from a buoy, in which case it would have to be connected with the source of power by means of a cable. By an ingenious mechanism the bell may be tolled or it may be made to ring any desired number or numbers at the will of the operator, who would thereby be enabled to send intelligible messages, each letter of the alphabet being represented by a given number.

To pick up the water sound waves emanating from such a bell the vibrations coming from the propeller of a torpedo or submarine boat Prof. Gray, in conjunction with Mr. Arthur J. Mundy, has devised a great variety of receivers, operated pneumatically, electrically and mechanically. For comparatively short distances a common ear trumpet screwed to the end of a piece of gas pipe may be made use of, the mouth of the trumpet being submerged and sealed by a tin diaphragm. For greater distances the inventors have constructed an electrical receiver, by means of which the bell has been heard distinctly at a distance of twelve miles. The submerged end of this receiver may be lowered over the side of the ship or attached to it on either side of the bow, under the water-line, like a pair of ears. The submerged part is connected by means of an ordinary telephone receiver, which may be carried to any part of the ship, say the pilot-house, where the navigator can listen for the sound of the bell. Prof. Gray has devised an improvement for the electrical receiver by means of which a large gong will be rung automatically in the pilot-house, or any other part of the ship, whenever the submerged bell is rung. That is to say, the gong rings sympathetically, following the bell, stroke by stroke, there being no connection between them other than the sound waves traveling through the water from the bell to the gong. Thus a bell may be submerged at some dangerous point along a coast and a vessel coming within two or three miles of it will be automatically warned of her danger by the strokes on the gong in the pilot-house.

In a report referring to a test of this system, dated December 31, a number of witnesses say:

"We, the undersigned, hereby certify that we have this day heard the submerged bell (struck electrically from the experimental station on board the Sea Bell) through the electrical receiver (submerged from the deck of a steamer engaged for the purpose), at distances of 1½, 4, 8 and 12 miles in the open sea. At 1½ miles the sound of the bell was heard very loud and very distinctly; at 4 miles the sound was quite as distinct and almost as loud as at 1½ miles; at 8 miles the sound was quite as distinct as at 1½ miles, and almost as loud as at 4 miles; at 12 miles the sound was heard at times quite distinctly and at times somewhat feebly. Even at 12 miles the sound received was sufficient to give a practicable warning signal. The bell was also heard in the forehold of the steamer, without any receiving apparatus whatever, at a distance of one-quarter of a mile so loud that it seemed to be right alongside the ship, and at a distance of 1½ miles it was heard faintly, but unmistakably, in the same position in the hold and without any apparatus for detecting sound."

This statement was signed by Commander Arthur P. Nazro, U. S. N., Prof. Wallace C. Sabine of Harvard University, Prof. William Y. Allen and others.

In Prof. Gray's opinion such an invention should prove of great value to navigators dur-

ing times of heavy fog by enabling them to tell their exact location, providing, of course, that such electrically operated submerged bells were placed at frequent intervals along the coast. The electrical receiver might also be used for detecting the approach of submarine torpedo-boats, whose machinery can be heard throbbing a distance of several miles. Taking it all in all, Prof. Gray's invention would seem to have great possibilities in it as a saver of life and property, and for this reason it is to be hoped the near future will see it given a fair trial on a practical scale at some point along the coast.

* * *

South America as a Market for Our Electrical Machinery.

paratus to the various countries of South America. As every year sees more of American made machinery going to those countries, a careful study of the regulations should be made by manufacturers seeking to extend their trade in that direction.

The amount of electrical goods shipped yearly from the United States to South America is at the present time by no means insignificant, still a little more effort and study of the question by manufacturers in this country would do much toward helping to establish a market and a demand for American made apparatus, that even Germany, at present our greatest rival in those countries, could not overcome.

A fair idea of the amount of business the electrical manufacturers in the United States are at present doing in South America may be gained by a glance at the figures covering the exports of electrical instruments and apparatus for the fiscal year ending June 30, 1900.

Of the various South American countries Argentina heads the list, with a total receipt of \$259,608 as against \$247,062 in 1899; Bolivia follows with a slight increase from \$225 in 1899 to \$724 in 1900; Brazil showing a material increase from \$113,981 to \$222,137; Chili from \$25,622 to \$32,358; Colombia shows a decline in import values under this classification from \$35,011 to \$25,437, but this is nearly counterbalanced by those of Ecuador, which shows an increase from \$10,471 in 1899 to \$18,747 in 1900. Perhaps none of the South American countries show a larger percentage of increase than does British Guiana, the exports jumping from \$4,078 to \$49,447; Dutch Guiana, on the other hand, shows a decrease from \$1,348 to \$80, while French Guiana shows a balance in its favor of \$5 as against nothing for the year previous. No shipments are reported in either year from Paraguay; while those for Peru show an increase from \$14,157 to \$75,353; and of Uruguay from \$4,768 to \$11,563; while Venezuela foots up the list with a remarkable decrease from \$25,271 in 1899 to \$6,478 in 1900. This makes a total for all the South American countries in 1900 of \$701,937 as against \$481,994 in 1899.

Taking similar returns in a more condensed form for the eleven months ending with the 30th of November the showing is that there has been a steady and material increase in these shipments to all South American countries for the past three years from \$331,752 in 1898 to \$547,887 in 1899, and still further to \$712,164 in 1900.

Again taking the returns for the fiscal

years of 1899 and 1900 we find that the total shipments of electrical machinery to South American countries in the former year was \$214,811, whereas in 1900 they show an increase to \$327,342.

Taken by countries, these returns show that the exports to Argentina have increased from \$114,733 to \$215,505; to Brazil, from \$77,777 to \$87,058; a decrease appears in the returns covering the exports to Chili from \$4,568 to \$132; on the other hand, Colombia shows an increase from \$3,039 to \$5,152; Ecuador shows a receipt of \$945 in 1900 as against none in 1899; British Guiana shows a decrease from \$915 to \$125, and Dutch Guiana from \$1,074 to \$519, with no shipments reported for French Guiana in either year, the same holding true for both Bolivia and Paraguay. The exports to Peru show a decrease from \$10,696 to \$8,515. Uruguay shows no receipts as compared with \$739 for the preceding year, while the returns from Venezuela show a jump from \$1,270 in 1899 to \$9,391 for the past fiscal year.

These figures are certainly encouraging, but there is not the slightest doubt but what with a little effort on the part of our manufacturers they could be materially improved upon, especially in view of the fact that most of our Southern neighbors are just beginning to erect electric lighting plants, build trolley roads and run telephone wires.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE Governor of the State of Tobasco, Mexico, has issued an order that the telephone systems in that State be at once extended from Chontalpa del Paraiso to Ceiba and Dos Bacos, the last-named town being located on the sea-coast.

THE New York State Electrical Contractors' Association, of which E. F. Lester of Syracuse is president, held its annual meeting in Utica on Tuesday, Jan. 15.

A RESIDENT of Parkersburg, W. Va., is said to have invented a new electrical heating device. By passing a current of electricity through a compound of earth substances an intense heat is generated. The heater itself is inclosed in a globe made either of porcelain or glass.

THE principal industries of Guatemala and the actual commercial affairs of that South American country are dealt with in a report recently issued by the Belgian representative at Guatemala. Among other things he states that the textile industry has made a certain advance as a domestic industry and that electricity is gradually being introduced, the capital and some other towns being lighted by means of the electric current.

At a meeting of the American Society of Mechanical Engineers at 12 West 31st street, New York city, on the evening of January 9, Cornelius Vanderbilt described in detail the locomotive firebox which he invented and which is now being given a trial on the New York Central Railroad.

THE recent experiments with wireless telegraphy in connection with the French fleet have been so satisfactory that it has been decided

to provide the entire Mediterranean squadron with wireless apparatus, which will be subjected to decisive tests during the coming cruise of that squadron. The recent experiments showed that dispatches can be exchanged reliably at distances of from eighteen to twenty miles.

The largest traveling electric crane in New York was put up at the Brooklyn Navy Yard last week. The apparatus has a capacity of forty tons, and there are other cranes on hand ready to be installed, one of twenty-five tons capacity and another of ten tons. In the main department of the machine shop and on the upper girder will run the crane, while on the track below the two ten ton lifting and carrying machines will be placed. The former will cost about \$12,000, while the latter will cost \$8,000 each. The forty ton crane will be used in the erecting department of the shop, where the big engines, boilers and other heavy parts of warships are handled.

A COMPLIMENT is paid to American management by the adoption of a number of features of the American telephone system by the National Telephone Company of Great Britain, which has lines throughout the United Kingdom. It is said that the British Post Office Department, which will compete with the private company this year, will also adopt a large number of American devices, such as underground wires, automatic signaling and metallic circuits.

The city of Buenos Ayres, Argentina, has a population of about 780,000. To supply it with electric light there are four companies. One, la Primitiva, is native born; a second, the River Plate Electric, is of English origin; the third, the Deutsch Ueberseisch, is, as its name denotes, German, and an offshot of the world-ranging Allgemeine. The last, la Compania General, is in spite of its title really French. Nevertheless for its plant it has gone in the main to the Heliös Company of Berlin (but the Allis engines are American, and the water-tube boilers French). Its station, which was opened in the beginning of last year, is now described at great length in the "Elektrotechnische Zeitschrift." It is on the monocyclic system, and if current should be wanted for any of the tramways synchronous motor generators are to be used.

ADVICES from London state that the Pacific Cable Committee has accepted, in behalf of the Governments of Great Britain, New South Wales, Queensland and New Zealand, the bid of the Telegraph Construction and Maintenance Company to make and lay a cable from Vancouver to Queensland and New Zealand, via Fanning, Fiji and Norfolk Islands, for \$8,973,000, the work to be finished at the end of 1902.

OUR Consuls keep harping upon the importance of paying more attention to packing for export. This is one of the most important features to be attended to in getting and securing foreign fields for our products. Nothing is so disappointing as to pull out broken articles ordered when the buyer is looking on, eager to carry away the article or commodity for which he has been watching and waiting for weeks. A little extra amount of excelsior, a few more nails or screws, a little better wood in boxes, a little better binding material, making a very trifling difference in expense, would

do wonders. Then, too, color, kind of articles, popular prejudices, means of transportation, geographical conditions, etc., play far more important parts in this matter than many merchants and manufacturers seem to think. Goods that go into the interior of South America, Asia, or Africa, on pack mules, donkeys or camels, must be packed not only better, but with due consideration of the animals' carrying capacity, than goods going to a seaport. This matter has been too long and too often neglected.

GEN. JUAN LUIS BUERON, of Guatemala, who is known as one of those who accompanied Gen. John C. Fremont on his second hazardous trip across the Rocky Mountains, arrived in the United States for the second time in November, 1900. Gen. Bueron's errand was to interest capitalists in a financial way. He has a concession from his Government for a line of road over the Chuepache Mountains, around the great volcano of Santa Maria, which is 14,000 feet high. There is a road from Champerico to San Felipe, the former being the seaport. From San Felipe the proposed road, which will be a Cremallaire cogwheel line, will ascend 7,000 feet to the summit and go down 1,000 feet to Quesaltenango. The grades will be about 9 per cent., and as there is in the Samala River water power to develop 8,000 horsepower of electricity, that will be the agent used. This will open a rich country, as the high plateaus will, it is said, grow anything that can be found in the Ohio Valley in the United States. There are also many mines in tributary regions.

OUR MANUFACTURING SUPREMACY.

BY JEAN WETMORE.

The foreign commerce of the United States owes its rapid development to a complex number of causes, but fundamentally to the higher average of intelligence among its producers, the result of free schools of a high order and a comprehensive postal system which brings the untrammelled products of the press into the most humble homes.

The United States Government has fostered the intelligence of the people, and their widened understanding and inventive genius have insured the creative power of the nation and given it prestige in international commercial competition.

Our workmen are above being dumb driven cattle; they are heroes in the strife, endowed with quickened mental faculties, which give skill and celerity of movement to their physical efforts. They direct the movements of machinery and through their intelligence they have practically graduated from manual drudgery. The latter has been growing constantly less through the ever increasing applications of still better mechanical aids.

The whole tendency of our growth is toward an increased output, of a better quality at a constantly decreasing cost price, and at the same time a gradual increase in the wages paid for the necessary superior quality of skill and knowledge required by the operators.

Improved machinery has made possible the well established fact that in many instances the lower the cost price of an article, the higher are the wages paid. Accurate, fast working machinery, with high-priced skilled attendance, has given us our commercial prestige. Our liberal patent laws have done much to en-

courage the inventive faculty among practical workmen, to yet further reduce the drudgery element and lower the cost of production.

As a result our productive capacity has gradually increased our wealth and consequently our available working capital, and to-day we are witnessing the rapid development of an element that has heretofore claimed little attention—the immense segregation of capital and skill in each particular industry that makes possible still further reduction in the cost of manufacture through more systematic business methods and a better utilization of the waste or by-products. Many of our manufacturing establishments have receipts from the sale of prepared waste material that formerly cost considerable to dispose of but which now equals the gross income from their staple products itself. These economies are possible only, through the use of the most improved methods and a high grade of scientific skill which only large capital doing business on a grand scale can command. Many of our largest exports at the present time are of this class.

The first century of the republic has been spent in getting ready to do business, by practicing on a trade of a domestic character. The second century of our growth will consist in actually doing a foreign export business which will not be rivaled by any other nation. Much has thus been accomplished but there is much yet to do. We are hampered by a diversity of languages, for which adequate preparations have not been given our young business men.

Our manufacturers have been protected and encouraged by wise laws to promote their rapid growth, but the same wisdom has not been shown in the direction of building up an international merchant marine.

Our commercial rating bureaus are unexcelled, but we have not as yet the same facilities in foreign markets. We are troubled by official red tape in Russia and ignorance in Turkey and China. Our internal preparations have been adequate for a world-wide commercial growth, while our preparations at the other end of the line have not received the attention they merit. We are even ridiculed for our ignorance in packing goods for foreign shipment.

We have the quality of goods the world desires and the prices to secure the trade but we have not at present the proper kind of foreign connection to give us the necessary advice and carry out our superior business methods.

These difficulties are only temporary and incident to our present stage of growth. The fundamental foundations of our commercial supremacy are substantially and wisely laid and the finished superstructure will be rapidly completed.

We have barred competition in our own markets by fostering the intelligence and the inventive genius of our individual workmen and protected our feeble industries until they are now able to make goods better and cheaper than their foreign rivals; our manufacturing trusts with their immense aggregation of capital and skill are now able to utilize every kind of waste product and through comprehensive systems of organization to save the cost of much useless labor, and turn it into productive channels, with the final result that the country now finds itself unable to consume its own products, owing to the great fecundity of its resources.

We now demand wider markets, and these are the reasons why the United States will eventually become during the second century of its existence the dominant and productive commercial power of the earth.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 10.

THE PRINCIPLE OF THE DYNAMO.

In the previous article we described an armature consisting of a single coil of wire connected to two segments for use as a commutator. This was done only to illustrate the principle involved in the induced electrical action, as such an arrangement would not make a practical dynamo for commercial use for a number of reasons; first, because of the unsteadiness or wavy character of the flow of current, and second, because of the high difference of pressure between the two plates which would very much interfere with the commutation of the current. To obviate these difficulties it is necessary that the coils of the armature be evenly and uniformly distributed over its entire surface and connected to commutator plates or segments at equal intervals.

About the first armature of this description that was put to commercial use was invented by a French scientist named Gramme and as a result a particular kind of armature is known to-day as the gramme type, sometimes called ring armature. The core of this type consisted of a ring of fine iron wire. Wound on this iron core was a continuous coil of insulated copper wire connected at equal and frequent intervals to commutator segments each of which was entirely insulated from all the rest.

FIG. 1.

Referring to Fig. 1 you will readily see the principle of this type. When this armature is placed in a magnetic field and revolved, the windings or coils which are opposite one pole cut the lines of force in an opposite direction to the coils opposite the other pole. This will induce opposing electrical pressures, which will cause a point at one side of the armature to be of a high electrical pressure of voltage while a point on the other side would be of a corresponding and equally low electrical pressure. If brushes forming the two ends of an external circuit be connected so as to bear on these points then the induced current will flow over the circuit from the high pressure brush to the low pressure one. The path of the current in the armature itself will be from the low pressure point to the high pressure one through both halves of the armature in multiple.

When an armature is wound in this manner the number of coils of wire or conductors op-

posite the pole pieces and cutting the lines of force is practically the same for every position of the armature during a revolution, consequently the induced electrical action will have an even and continuous pressure when it is revolved at a uniform rate of speed.

Commercial gramme or ring armatures as a rule are not wound with a continuous wire but each division is wound as a separate coil and the end of one coil connected at the commutator segments with the beginning of the next coil, etc., making practically one continuous winding which is electrically the same as though made with a single long wire. The advantage of this is that it is much more convenient to construct and also makes it possible to better insulate the different parts of the windings from each other.

As has been said, the core of the gramme armature was made of iron wire coiled up in the form of a ring; however, it does not necessarily follow that this must be so, for a great majority have cores built up of disks which are punched out of sheet iron and insulated from each other by thin tissue paper placed between them. The object to be obtained by dividing the core into disks and insulating them from each other is the prevention of currents being set up in the core itself when it is revolved in

as possible the objectionable features produced by this condition it is essential that the armature cores be made of very soft wrought iron which has been well annealed.

In constructing dynamos there must, necessarily, be a certain amount of non-magnetic space between the iron pole pieces and the iron core of the armature. This is usually called the gap, and as it is not an insulator of magnetism, a certain number of the lines of force set up by the fields will leak around the armature instead of passing through it, causing a proportional waste of energy. In order, therefore, that this leak shall be as low as possible it is essential that the air space, which forms part of the reluctance of the circuit, shall be as small as the operation of the machine will permit.

To get the iron of the armature core as close to the pole pieces of the field as possible the disks of which it is composed are often constructed toothed and the windings are placed in the grooves between the teeth. It might be reasonably supposed that some of the lines of force would leak through the iron in this case without acting on the turns of the wire, thus causing a reduction in the electrical pressure produced by the machine. This assumption would not be correct, however, for it has

FIG. 2.

a magnetic field. The same principle applies in this that does in the induction coil core and eddy currents will be set up by the action of the lines of force.

These currents tend to flow in armature cores from one end to the other at the surface and returning again near the center of the core. The great objection to permitting currents to circulate in this manner in a core is that it must necessarily take power to keep them in circulation, and also the continual action is productive of heat which may become so intense as to damage the insulation of the coils. By properly laminating the cores these objectionable features may be nearly all prevented while at the same time the passage of the lines of force from one side of the core to the other will not be interfered with whatever.

There is another cause for heating and loss of power in armature cores that cannot be prevented by lamination. This appears to be due to the friction between the molecules of the metal as they are caused to turn over by the attraction of the magnetic field while the armature is revolving. It would appear as if the molecules turned with their magnetism, as the magnetism of the entire core is being governed by the opposite polarities of the fields. While this action is going on a certain amount of power is being used and converted into heat. This effect is called hysteresis, and the amount of heat produced and power wasted in a core on account of it depends upon the quality of the iron, upon the amount of iron in the core, the density of the magnetism and the number of revolutions per minute. To prevent as far

been demonstrated that an armature thus constructed will give just the same electrical pressure when revolved in a magnetic field as one with a corresponding number of conductors wound on the surface when revolved at the same speed under the same conditions.

An armature may also be constructed in the shape of a drum instead of in the form of a ring and in which case all the windings would be on the surface. This type is called Siemens or drum armatures.

The form of winding is given in Fig. 2, which represents a drum armature with one coil wound on and connected. Armatures of this style usually have from thirty to one hundred coils, dependent, of course, on the design of the machine and the purpose for which it is intended.

The manner in which the field coils of a dynamo are connected will depend upon the use for which the machine may be constructed, but in a simple type where the voltage is supposed to remain constant they are connected across the circuit in multiple with the armature. After a dynamo has once been operated there will remain in the iron of the fields a certain amount of magnetism called residual magnetism, which will be sufficient to induce electrical action when the machine is started. The condition will then quickly grow in strength until its normal amount is reached.

The question might here be asked What is the reason for a great amount of power being required to revolve the armature, and why the amount of power required is governed by the output of the machine? This can be answered

by referring to Article 8, where is explained the laws governing the action of the induction coil. This same law holds good in the dynamo, which is that the tendency of the field produced by the induced electrical action is to oppose the inducing field, and of course the strength of that opposition will depend on the strength of the field produced by the induced currents which, in turn, is governed by

ELECTRICITY AT THE PAN-AMERICAN EXPOSITION.

BY ELBERT L. LEWIS.

The purpose of the management of the Pan-American Exposition at Buffalo to make its electrical display the dominant feature of the great show and unexampled in importance is worthy of the time and the place. Wonderful

Power Company, which has harnessed the greatest water-power in the world, and at present has a visible supply of 55,000 horse power, with a like amount being rapidly developed, the opportunity to carry out the splendid idea is an exceptional one. The power of Niagara, sent into the Exposition grounds by means of electric cables, will turn the countless wheels and drive machinery of every description, fur-

ELECTRIC TOWER AT THE PAN-AMERICAN EXPOSITION.

the amount of induced current being used from the machine which must flow through the armature.

Article No. 11 will be entitled "Motors."

The owner of every electric motor in use in Argentina is obliged to pay a national annual tax of \$15.

as have been the discoveries of electrical science in the latter years of the century just closed it is confidently predicted that they will be dwarfed by the developments in the same sphere in the early years of the new century, and therefore the subject is of extraordinary world-interest. Situated within twenty miles of the perfect power-plant of the Niagara Falls

nish power for electric carriages, cars and boats and illuminate the City of Palaces by night.

The Exposition will have an Electricity Building and an Electric Tower and manifold electrical features. Satisfactory progress is being made with the work of construction, and when the gates open on the first of next May

everything will be in readiness for the incomparable electrical display planned.

The Electricity Building is practically completed. It lacks only the finishing touches, in the interior principally, to make it ready for exhibits. It has been wired throughout for lighting and thousands of electric lamps have been installed inside and out. The beauty of this building challenges the admiration of all visitors to the Exposition grounds. The architecture is a free treatment of the Spanish Renaissance. The outside walls are covered with staff, intricate in design and artistically colored, and at the entrances and upon domes and towers are statuary and modeled groups. It is situated in the northwestern part of the grounds. The south facade fronts the Mall

and the north fronts the Midway. The east end is toward the Electric Tower, while the west faces the Grand Canal. The openings of the pergola-like loggias, placed at frequent intervals, present a delightful effect, showing more and more of the details of the pilasters and openings as the eye travels to the end of the building farthest away from the observer.

There is a pleasing ending at each corner of the structure with a low-domed pavilion tower, and the facade is interrupted at the center by a double-towered entrance. This entrance, wide and high, is spanned by an ornamental arch and supported on each side by columns. The towers, also, have minor entrances through them.

The connecting work between the towers, the towers themselves, the pavilions at the corners of the building and similar places are to be brilliantly illuminated and made gay with banners and flags.

The horticultural and floral embellishment of the grounds about the building is very fine.

The Electricity Building covers an area of 75,000 square feet, being 500 feet long from east to west and 150 feet wide. The incorporation of architectural features to make the building conform to the general architectural setting of the group has given much space for promenades, etc., and left approximately 25,000 square feet of space for exhibit purposes. On account of the great interest taken by the general public in electrical science, engineering and invention, and consequently the anticipated attraction of large numbers of Exposition visitors to the Electricity Building the aisles have been made very wide. The main longitudinal aisle is 15 feet wide and the side ones 12 feet wide.

In the northwest corner of the building will be what is known as the Niagara Falls transformer plant, with a capacity of 5,000 horse power. This plant will consist of nineteen 250 kilowatt air-blast transformers, the purpose of which is to transform power from Niagara Falls, delivered at 11,000 volts for distribution about the grounds. Smaller transformers will be used at various points about the Exposition for changing this pressure of

1,800 volts to 103 volts for the operation of lights and other electrical Exposition accessories. All the latest devices for the handling of high pressure electric power will be shown on a complete switchboard, which will be installed in this section, and the various circuits emanating from the Electricity Building will be controlled by a low pressure switchboard. A sub or transformer-station will also be demonstrated in this division.

The progress in the development and application of the various branches of electrical science and industry of recent years makes the exhibit at the Pan-American Exposition of the utmost importance and interest. It will comprehend the entire broad field. The utilization of electricity in various forms of manufacturing industries will be illustrated. This utilization of electricity is destined to be one of the greatest of its fields, and the Niagara Frontier is now an object-lesson in this respect, for the development of Niagara power is almost every day drawing new industries to that region because the proximity and the availability of this power render the manufacturing opportunities so exceptional.

The aim will be to make the electrical exhibit in the Electricity Building a collective one rather than one composed exclusively of individual commercial exhibits. The exhibit will be divided into two groups:

1st. The collective exhibit, which will consist of retrospective exhibits of historical interest illustrating models, or practical contrasts showing the advances in the art.

2nd. The commercial exhibit, composed

of those exhibits possessing distinctive merit whether this consists in workmanship, novelties or useful applications.

As a whole the exhibits in this building will be both attractive and educational in a degree not before realized at any exposition held upon the American continent. They will serve to excite popular interest and in this way to stimulate more general study of this great field of science and a wider intelligence will thus be created upon the subject of the mysterious force known as electricity and its wonderful value to mankind in its application to industrial pursuits.

Directly across the Mall from the Electricity Building is the Machinery and Transportation Building, which is also practically completed. It is similar in appearance, but larger, being

500 by 350 feet in dimensions. Its illumination at night some time back afforded a magnificent spectacle for thousands of curious people, and gave a good idea of the effect to be produced by the illumination of the Electricity Building. Visitors may readily pass from one to the other of these buildings and make comparisons between the closely allied apparatus contained in the two.

The Electric Tower has nearly reached its full height of 391 feet, only the statue of the

Goddess of Light being needed to be placed in position to reach that altitude. The framework is up and the staff is being put on the walls of the main body of the structure, which is 80 feet square up to a height of 200 feet. The colonnades flanking the tower on the east and west and forming a semicircle 200 feet across are also rapidly nearing completion.

The arrangements for the Electrical Fountain effects are going on satisfactorily. The switchboard, by means of which lights of rainbow hues will be thrown upon the fountains has been installed. The fountain display will require 35,000 gallons of water per minute, a much greater quantity than has ever been used for a similar purpose at an exposition. Some of the jets in the Court of Fountains will be 50 feet high. The basin of this Court is 565 by 225 feet in dimensions, which equals 98,872 square feet. Under its waters will be placed 94 large seachlights to cast colored lights on the fountains and cascades and heighten the beauty of the electric and hydraulic effects. The cascade falling from the Electric Tower into the grand basin will be 70 feet high and 30 feet wide.

The courts to be illuminated contain 1,390,000 square feet of space, an area two and one-half times greater than that of the courts at the Columbian Exposition, twice the area of those at the Paris Exposition, and thrice those at the Trans-Mississippi Exposition at Omaha.

Scores of ornamental lamp-posts, each of which will support 25 electric lamps, have been set in the courts and other parts of the grounds.

In the grand illumination about the court of Fountains, Electric Tower, Esplanade and Plaza, 200,000 incandescent lamps will be used. The installation requires 400 miles of wire, weighing about 250 tons.

The Thompson Aerio-Cycle, which will carry passengers to an altitude of 275 feet, in cars hanging in revolving wheels fixed at either end of a steel beam, the middle of which rests upon a steel column and has the play of the "seesaw" or "teeter" of boyhood, will be operated by Niagara Falls electric power and lighted by 2,000 electric lamps. The lights will be of changeable color, adding considerably to the effect of the illumination of the courts and buildings.

The many thousands of lights on the Midway will be additional to the 200,000 used elsewhere in the grounds.

The plant of the Niagara Falls Power Company at Niagara Falls will supply 5,000 electrical horse-power, and as much more will be generated on the grounds, for the purposes of the Exposition. The service arranged for contemplates the utilization of the water power of Niagara, the use of gasoline for motive power, of gas, both under boilers, producing steam, and in gas engines, producing energy; thus giving the Pan-American the greatest variety of sources of power ever enjoyed by any exposition.

The electric launches which will be run in the fine system of canals in the Exposition grounds are being built in New York, and are nearly ready for shipment. They are of the latest pattern and very handsome. They will be transported by special train from the metropolis to the grounds.

Complete, unique and instructive as the electrical display at the Pan-American will be, it must, as a matter of course, attract all persons interested in the development of the newest science.

WATER LOADS FOR ELECTRICITY WORKS*

BY W. E. WARRILOW.

In the early days of electric lighting, when small units were commonly employed, the reliability of the plant was generally accepted, after its preliminary trials by the builders and at the works on its own foundations. After settling down to regular running, the few repairs necessary were effected, and the plant was again given its usual work without testing on an artificial load, though no doubt it would be run round "light" for a short time. Apart from this, no other test would be applied, the machine being "chanced" on the lights when it was considered in a fit condition to take up regular running. This may seem a risky course to pursue, but the particular circumstances would merit it. The size of the unit was conducive to general satisfactory running, and when breakdowns did occur the spare set could be gotten up to speed almost immediately, so that the lights would hardly be out. Consequently, when all things are considered, the engineer was almost justified in putting his machinery, which had been repaired, on the mains without previous load tests.

The growth of the electrical industry, however, has changed the whole aspect of affairs, so much so that the altered conditions bring in their train difficulties which must be met and overcome. Experience has shown that small units are no longer economical when repeated in great numbers to meet the increasing demand, consequently the size of generat-

*From the "Electrical Review," London.

ing units has of recent years been going up by leaps and bounds. Whether the limits have yet been reached it is impossible, of course, to say, but it is nevertheless true that units ranging from 500 to 1,500 kw. are being laid down yearly. The concentration of so much power in one unit is a serious matter, as such a number of lights are dependent on the satisfactory running of one machine, and the consequences of breakdown are by no means pleasant for the consumer. Extra precautions are therefore necessary to ensure the reliable running of the plant when such dire results are attendant on its failure. The size of the unit, moreover, brings with it certain unavoidable features. It cannot be gotten up to speed at a moment's notice, the engine taking perhaps four or five minutes to attain its normal number of revolutions, and where it has been necessary to shut another plant down on account of sudden mechanical or electrical failure, every moment is precious. When machines are running in parallel the withdrawal of the faulty unit may necessitate the opening of a circuit if the remaining sets cannot maintain the normal voltage, and on this occasion the tardiness of the large unit in attaining synchronism will be painfully evident.

The maintenance of large electric light engines in thorough repair is no small matter,

WATER RESISTANCE ON ROOF OF BOILER HOUSE.

and one from which the element of chance should be almost, if not entirely absent. Repairs to brasses and reciprocating parts generally should be followed by tests which can leave no doubt in the mind of the engineer as to the fitness of the plant to resume its regular work. Allowance can, of course, be made for unforeseen circumstances, but every opportunity should be taken of those means which can make "assurance doubly sure." The tests referred to are of the electrical order, and are carried out on an adjustable load provided for the dynamo. This usually takes the shape of a water resistance, which, though well known, is seldom erected as a permanency on the works. When new generating sets are put down, the trials are run on resistances of a temporary nature provided by the contractor for the plant, and removed by him at the conclusion of the trials.

There are, of course, several firms who can supply an artificial load to deal with machines of any capacity, but their prices are prohibitive. It is, however, possible to manufacture the apparatus at the works, and the following lines describe a "home made" resistance constructed at small cost. No novelty is claimed for its principle, though its utility and satisfactory working may sanction its description.

The accompanying half tone and diagrams will give a general idea of the construction and position of the apparatus. The resistance of water is made use of by suspending lead plates, connected to one pole of the circuit, in the water, while the other pole (or conductor) is connected to the tank, containing the water.

Referring to the diagram the tank A, containing the water is fitted with inlet close to the bottom, and overflow may be allowed to pass over the top of the tank; B B are wrought-iron pipes screwed into castings bolted to the inside ends of the tank, and these pipes act as guides to the beams C C, which are fitted with a number of lead plates or strips, D D, bent to drop over and rest on the beams. The two beams are held apart by distance pieces E E, having holes drilled in them for the reception of the supporting iron, F, this latter being shaped with a loop for the raising and lowering wire. The wire is not fastened direct to the iron, but round a bolt passing through a thong of leather laminations. This serves the double purpose of providing a flexible support to the beams and insulating the wire from currents which may lead to the rod. The wire passes over the pulley, G, fixed to the bracket, H, which is firmly bolted to the wall. A hole in the wall admits of the passage of the wire into the engine room, where it is brought over pulleys (suitably placed) to the raising and lowering screw, shown by Fig. 2. The adjustment is carried out by means of a large wooden handle, which is free to turn in a recess in the wall cut for the purpose. The wire is fastened to the end of a pipe in which the screw works, the pipe being prevented from turning by a screw which projects into a slot cut in the pipe. A small pointer fastened to the lower end of the pipe makes the adjustment to exact requirements an easy matter, a scale marked out in amperes or kilowatts being painted on the base of the arrangement. When the adjusting screw can be placed quite close to the switch gear the scale is not necessary, as adjustments can be made with a minimum of trouble, but where the screw is more easily placed on the opposite side of the engine room to the switchboard the convenience of the scale will become evident. The dimensions of the tank are given in the diagram, so that other parts will appear in proportion, but in the construction of another such arrangement the particular circumstances will call for slight alteration.

The arrangement in question, which has recently been erected in a large alternating current station in the Midlands, is fixed on the roof of the boiler house, the supports for the tank being fixed in the engine house wall. The position is an excellent one, as complete isolation during working is easily effected, and the overflow from the tank is carried away without expensive piping arrangements, the rain-water spouting doing all that is necessary. Extra precautions are needed to ensure the confinement of high pressure currents, but these present no difficulties that cannot be surmounted. The flexible cables carrying current to the moving lead plates require the greatest amount of care, though a satisfactory arrangement of these is no hard matter. The half-tone will make clear the disposition of the joint box and cables. Suffice it to say that the main from the switchboard is a concentric lead covered one, and the box is arranged with fittings for bifurcating.

The load tests carried out on the resistance prove its capabilities very well. A 600 kw. al-

ternator has been run at full load quite successfully on the tank without any boiling of the water, the circulation being maintained through the test. The lead plates in this case were only one-quarter immersed, so that when the distance to be traversed is considered, 1,800 kw. may be successfully dealt with by the tank. The arrangement has not been tested for arcing through the water or across the atmosphere moistened by the steam from the water, but as no signs of such occurrences have yet become evident, their possibilities may be left undiscussed. At the same time, every precaution for insulation has been taken.

The distance between the lead plates and the tank sides is the same all round, the load adjustment being effected by reduction of the distance between the plates and the tank bottom. Should the wire or leather thong break,

TRAIN LIGHTING.

At the International Railway Congress at Paris two reports were presented upon the subject of train lighting, which were referred to briefly in the columns of *ELECTRICITY* some weeks ago. These reports by MM. Chaperon and Herard and M. Banovits, respectively, were so interesting that a request has reached this office asking for further details. As already stated, report No. 1, or that of MM. Chaperon and Herard, deals exclusively with the systems of train lighting in vogue in the principal countries of the Continent and in Great Britain, while report No. 2, by M. Banovits, deals with the lighting systems in use in the railways of Austria-Hungary, the Netherlands, Roumania and Germany. The Chaperon and Herard report says:

FIG. 1.

FIG. 2.

the plates could not reach the bottom of the tank by reason of the stops afforded by the brackets supporting the guide tubes. The above devices seem to make every allowance for apparent possibilities of accident, so that omitting the unforeseen, the arrangement should work satisfactorily for all time.

The chief item of expense is the tank, which will cost about £20, and the other items, excluding the cable from the switch gear, will bring the price up to £30 or £35, a figure which will compare very favorably with the prices quoted by manufacturers. The cost of the cable, which should be of the best (the use of old material is never to be commended), will vary with the distance between tank and switch gear, but £45 to £50 will be an average figure.

All things considered, then, there is no reason why large units should be run with any doubt as to their reliability after repair, as at small cost a satisfactory testing arrangement can be erected which will well repay the time and money expended on it.

"The railway companies have aimed at a result, if not perfect, at least very satisfactory, by different methods, either in perfecting the apparatus for using oil or petroleum, or in multiplying their number—or by recourse to new and altogether different systems, viz., gas or electricity. With oil lighting the expense of installation is comparatively low, but it requires a numerous staff for cleaning, filling and maintaining the lamps. It is requisite that this work should be carefully done, as the quality of the light and the economy of the system depend absolutely on the manner in which it is done; finally, the quality of oil, wicks, etc., have first importance. All these necessary conditions required in good oil or petroleum lighting bring the cost per lamp-hour to quite a high figure.

"In gas lighting the cost of installation for the manufacture and supply of the gas is quite considerable. The expense for labor is reduced to the minimum, the services of the staff being limited to wiping the cups and chimneys of the lamps, the examination of the burners

and supplying the reserves or tanks of the carriages. The advantages of the system are principally in the quality of the lights, the facility of modifying the intensity as well as the simplicity of the labor in maintenance and cleaning and in the activity in filling the supply tanks.

"The lighting power of the gas may be still improved by mixing it with highly carbureted products. Several of these have been made use of, among others naphthaline (albo-carbon), which has not given very good results; acetylene mixed with gas in the proportion of 25 to 30 per cent gives the flame a very considerable intensity and fixity.

"Electric lighting is, without contradiction, that which is presented under the most attractive form. Incandescent electric lamps have, in fact, an incontestable superiority over all the other methods of lighting, as much from the point of view of comfort as that of facility of installation of luminous centers, which may be as intense as desired and which can be placed at the most convenient points for the passengers. They produce no, or next to no heat, and there is no occasion to provide for the products of combustion being carried outside. The electric lighting of the carriages produced by means of a dynamo driven by the axle during the run of the train realizes, in principle, a complete and rational system of lighting."

In concluding, the authors express the hope that the discussion will be the means of eliciting the information as to whether the car axle lighting system would be likely to deteriorate after a limited use.

M. Banovits, after reviewing the history of train lighting by means of candles, primitive oil lamps, acetylene, etc., says:

"In fact it cannot be concealed that between the methods of lighting by candle and oil on the one side and electric lighting and mixed gas lighting on the other, the difference is immense. The luminous intensity which has been secured (and which may yet be surpassed by these two last methods of lighting) is such that it unites perfectly all the requirements, and finally electricity presents a complete security against dangers of fire and explosion."

Continuing the report says:

"Electric lighting has for itself the immense advantage of perfect security against the dangers of fire and explosion. This advantage compensates largely for all the inconveniences in the system—in fact to-day in any instance of a particularly delicate nature, such as in the trains of the royal families, the transportation of objects of great value, etc., preference is rightfully given to electric lighting.

"If in the special cases we have just enumerated, the taking into consideration of the greatest security is justified, it is proper to examine also into the question of running if it would not also be proper to take it into account from the general view of the passenger service. It cannot be denied that in spite of all the precautions taken by the railway managements, it is scarcely possible to arrive at absolute security against railway accidents. The possibility of such accidents being granted, it requires only the combination of unfavorable circumstances that the catastrophe should be of the largest proportions.

"Finally it should be noted that the method of electric lighting generally made use of—by storage batteries exclusively—is not the only

method of applying this light. It is not denied that the experiments actually in course of trial by some of the lines of the German Union system, either by means of a moving vehicle producing the current for the whole train, or by the production of the current required for each particular carriage, partly by a dynamo driven by the motion of the carriage itself, and partly by storage batteries—may be crowned with success; nor that the results obtained either under the item of expense as under that of simplification of the maintenance, may be more favorable than those realized in the exclusive use of storage batteries upon a large scale, that is to say, under normal conditions."

M. Banovits concludes as follows:

"Of all the modes of lighting adopted up to the present time for the lighting of trains, that which seems to us to answer the best to the conditions of a perfect light is electric lighting, for besides offering the greatest security against the danger of fire, it possesses a proper luminous intensity, assures a light, clean, fixed, exempt from atmospheric influences, and permits a simple and economical dimming for the night. This mode of lighting has moreover the advantage of a simple maintenance and as soon as its application is made upon a large scale, a service will be assured by proper installations, which will be regular and rapid, even in cases of the densest train movement. Everything in short invites to the belief that from the pecuniary point of view this method of lighting will permit more favorable economical results than have hitherto been attained; and under this head it may pertinently be remarked that the advantages which at the moment other methods of lighting may appear to present over electric lighting are largely offset by the superiority of safety conditions and by the other inherent advantages of the method."

The first report in a table giving the number of cars lighted by electricity in the principal countries, states that the United States has 74. There must surely be some error in this figure, as the Santa Fé road, besides several others, have been lighting a number of their cars by means of axle driven dynamos, combined with storage batteries, with both economy and success.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended January 9:

Australia, 72 cases, \$2,026; Barcelona, 3 cases, \$107; Belfast, 8 packages cables, \$2,118; Bolivia, 1 case, \$43; Brazil, 21 packages, \$665; 4 packages railroad material, \$601; 1,000 feet of cables, \$210; British East Indies, 58 packages, \$540; British Possessions in Africa, 49 cases, \$4,039; British West Indies, 12 packages, \$455; Central America, 58 packages, \$791; Chili, 88 cases, \$2,571; Christiania, 18 cases, \$227; Cuba, 52 cases, \$1,852; Havre, 20 cases, \$1,177; Hayti, 3 cases, \$41; Liverpool, 157 packages, \$8,218; London, 91 packages, \$17,743; 19 cases motor vehicles, \$22,367; 15 reels cables, \$5,500; Manchester, 193 packages, \$19,709; Marseilles, 46 cases, \$3,370; Mexico, 36 cases, \$983; New Zealand, 2 cases, \$51; Peru, 10 packages, \$641; Porto Rico, 36 packages, \$2,336; Ramsgate, 24 cases, \$2,000; Reval, 7 packages, \$590; Santo Domingo, 4 cases, \$41; St. Petersburg, 1 motor carriage, \$640; U. S. Colombia, 114 packages, \$780.

IV.—HIGH TENSION POWER TRANSMISSION PLANTS IN FRANCE.

BY FRANK C. PERKINS.

Lancey Monophase Plant in the Valley of Gresivanden.

In the Valley of Gresivanden along the River Isere, there are many little villages of more to less importance, and all of them are now illuminated by electric lights, and a

rectly coupled to a high pressure turbine in the same room. One of the turbines has a capacity of 300 horse power and the other has an output of 500 horse power. The alternators are of the stationary armature type with revolving fields. They were designed by M. Labour of the Société L'Eclairage Electrique of Paris. The armatures are so arranged as to be movable to the right or left on the bed plate, leaving the field magnets exposed for repairs if found necessary.

FIG. 8—12,000-VOLT STEP-DOWN TRANSFORMER ON THE LANCEY, FRANCE, TRANSMISSION LINE.

number of the small factories are operated by small motors which receive their supply of power from the energy of the river running along their beautiful valley near by. There are thirty-five of these little hamlets along the transmission line (Fig. 8) extending more than 30 kilometers to the power house which is located at Lancey. The potential on the transmission line (Fig. 8.) is 12,000 volts and the current is reduced in pressure by the step-down transformer to 110 volts, for use in the village.

The power house is equipped with two monophase machines (Fig. 9), each of which is di-

The direct current for exciting the fields of the alternators is supplied from a small continuous current dynamo, seen in the foreground in the accompanying illustration, Fig. 9, and is driven by a belt from the shaft of the direct-connected turbine and generator.

In addition to the 30,000 volt, alternator exhibited by this firm at the Paris Exposition, a 1,200 kilowatt three-phase generator was shown and was of considerable merit. This machine generated a current of 3,000 volts potential and operated at a frequency of 50 cycles per second. It was direct connected to a Dujardin tandem compound engine. The field magnets

of this machine were of the revolving type, and acted as the fly wheel for the engine. The external diameter of the generator was 5.6 meters; 100,000 volts was the high potential which was developed at the Exposition by the engineers of this firm in their experiments with an M. d'Arsonval high tension transformer.

There is little hope that these high potentials can be successfully used in practice on any transmission line for actual power and lighting plants. The difficulties met with in properly insulating a transmission circuit for such high pressures are well nigh insurmountable with the present insulating materials in use.

There is little question but that the 30,000 volts generated directly from the Labour high tension alternator is near the limit for practical use, and it is in but few places that such voltages may be considered safe and practical.

Some of the Western power plants in America have been operated at these high poten-

DUTIES ON ELECTRICAL GOODS TO SOUTH AMERICA

Requirements to be Followed in Shipping Electrical Apparatus to the Various Countries.

ARGENTINA.

There are no restrictions as to the marking of packages intended for the Argentine Republic, but each package, etc., must bear an individual number, each differing from the other. All measurements and weights must be given in the metric system. The duties for electrical goods are as follows, the valuation being fixed by the Government:

Accessories of all kinds, such as switches, fusible interceptors, contact-makers, interrupters or alarm-keys, buttons, commutators of all kinds, shapes and systems, with porcelain base and covers, 25 per cent. ad valorem on valuation of 52.8c per kilogram; the same with porcelain base and metal cover, 25 per cent. on value of 85.4c per kilogram; the same with

flexible cords, with two or more conductors, or copper, spiral-shaped, of any diameter, covered with cotton, mohair, wool, or other materials, 25 per cent. on valuation of \$1.92 per kilogram; the same covered with silk, 25 per cent. on valuation of \$2.88.

Morse's telegraphic apparatus, 25 per cent. on valuation of \$17.28 each; the same without clockwork, 25 per cent. on valuation of \$8.64 each.

Sheaths or tubes of porcelain, 25 per cent. on valuation of 1.15c per kilogram.

Knobs, wooden, common, for electric bells, 25 per cent. on valuation of 38.4c per dozen; the same, pear-shaped and other kinds, 25 per cent. on valuation of 76c per dozen.

Electric bells, 25 per cent. on valuation of 48c each.

Carbons for arc-lamps, 25 per cent. on valuation of 1.44c per kilogram, gross weight.

Ebonite, in sheets, 25 per cent. on valuation of \$1.15 per kilogram; same in tubes or bars, 25 per cent. on valuation of \$1.50 per kilogram.

Vulcanized fiber in sheets, 25 per cent. on valuation of 48c per kilogram; same in tubes or bars, 25 per cent. on value of 96c per kilogram.

Portable galvanometers, 25 per cent. on valuation of \$3.84 each.

Voltaic arc-lamps or regulators and their accessories, such as corresponding fittings and globes, up to 60 centimeters in height, 25 per cent. on valuation of \$11.52 each; same from 60 centimeters to 1 meter, 25 per cent. on valuation of \$17.28 each; same, more than 1 meter, 25 per cent. on valuation of \$25 each.

Voltaic arc-lamps, incandescent, 25 per cent. on valuation of \$2.68 per dozen.

Metals or elements of metals for batteries, 25 per cent. on valuation of 14c per kilogram.

Electric motors for ventilators, 25 per cent. on valuation of \$9.68 each.

Hooks or iron for insulators, 25 per cent. on valuation of 11.5c per kilogram.

Porous jars, charged for batteries, 25 per cent. on valuation of 11.5c per kilogram, gross weight.

Supports for electric lamps, of falence or of falence and bronze, 25 per cent. on a valuation of 43c per kilogram; the same with bronze claws, sockets and connections, 25 per cent. on valuation of \$1.44 each.

Telephones, without bobbin, 25 per cent. on valuation of \$2.88 each; same with bobbin, 25 per cent. on valuation of \$3.84 each; same magnet, 25 per cent. on valuation of \$6.72 each.

Insulating tubes, of Bergman's system with their accessories, such as elbows, sockets, derivation boxes, etc., not coppered, 25 per cent. on valuation of 28.8c per kilogram; same coppered, 25 per cent. on valuation of 38.4c per kilogram.

Jars of earthenware for batteries and accumulators of any form and size, 25 per cent. on valuation of .067c per kilogram; same of earthenware, porous or varnished, 25 per cent. on valuation of 9c per kilogram.

BOLIVIA.

No restrictions whatever as to marking, and while packages of the same kind may be numbered alike, care must be taken that two different kinds of packages are not included in the same number. Weight and measurements must be in the metric system.

BRAZIL.

No restrictions as to marking; each package, piece, etc., must bear its own individual number, each differing from the other. The gross net and actual weight of each package is required to be given in the metric system.

Tariff: Copper wire, plain, 400 reils per kilogram; same insulated with paper, cotton, or rubber, 900 reils per kilogram; same plated, gilt, or covered with silk, 2,400 reils per kilogram; same telephone, telegraph and elastic, 20 per cent.

Electro-galvanic or electro-magnetic rings, collars and chains, 16,000 reils per kilogram.

Magnetic needles, 300 reils each.

CHILI.

No restriction as to marking. Each package must have its own number.

FIG. 9.—POWER HOUSE AT LANCEY, FRANCE, FOR SUPPLYING CURRENT TO 35 VILLAGES.

tials, and the tendency is to raise the voltage far above what has been considered safe in the past. What has caused this great change? Unquestionably the development of the polyphase system has been the means of bringing these high pressures within the reach of the engineer, allowing him a cheap transmission line, even though long distances must be traversed and the income expected only moderate. The polyphase motor, and the highly efficient static transformers also have aided in this result, and the very satisfactory rotary converter has also brought the system to a point of completion by being able to deliver at will direct currents to any point in the territory desired.

A New Underground Telephone Cable.

A new underground telephone cable is about to be tried in Germany. The *modus operandi* consists in drawing the cable through a wide tube containing air, and covered with a thin metal guard. It is proposed to lay the first line between Düsseldorf and Elberfeld, a distance of 22 miles.

slate or marble base, with or without cover, 25 per cent. on value of \$1.15 per kilogram.

Insulators, glass, 25 per cent. on value of .056c per kilogram, gross weight; same earthenware, falence or porcelain, of more than 3 centimeters in diameter, with or without hooks, 25 per cent. on value of 10c per kilogram, gross weight; the same up to 3 centimeters in diameter, 25 per cent. on value of 24c per kilogram, gross weight.

Wire or cables of copper, up to 5 millimeters in diameter, covered with cotton, gutta-percha, or other materials, excluding wire covered with lead or silk and flexible cords of all kinds, 25 per cent. on value of 67.2c per kilogram; the same of more than five millimeters in diameter, 25 per cent. on valuation of 54.6c per kilogram; the same up to five millimeters in diameter, covered with lead, 25 per cent. on valuation of 48c per kilogram; the same of more than 5 millimeters, 25 per cent. on valuation of 48c per kilogram; the same underground, with interior envelope of lead, and iron or steel armor, 25 per cent. on valuation of 38.4c per kilogram; the same of iron or steel, covered with cotton, gutta-percha, or other materials, 25 per cent. on valuation of 28.8c per kilogram; the same

Measurements and weights must be in the metric system.

Tariff: Telephone and telegraph apparatus, free.

Electric call-bells, 25 per cent.

Cross-arms for telegraph poles of iron or steel, free; same wooden, 25 per cent. on valuation of 32c per kilogram.

Insulators, free; lamps for electric lighting, 25 per cent. on a value of \$6 per kilogram, gross weight.

Electric meters, free.

Electric batteries free.

Telephones, free.

COLOMBIA.

The marking is restricted to one uniform mark for each consignee, two marks calling for two bills of lading. Packages of the same kind may be numbered alike, but two different kinds of packages may not go under the same number. Weights and measurements must be in the metric system.

Tariff: Telegraph wire for public use, free; same for private use, .024 centavo per kilogram.

Lighting apparatus, .01 centavo per kilogram.

Motors of all kinds, .024 centavo per kilogram.

ECUADOR.

Restriction to one uniform mark for each consignee, two marks requiring two bills of lading. Packages of same class may be numbered together, but different kinds of packages may not be mixed. Only gross weight required for each package; all weights and measures must be in the metric system.

GUIANA—BRITISH.

All machinery and wiring for electric lighting, telegraph instruments and other materials imported by telegraphic companies, and necessary for the construction and use in offices of their works and stations in the Colony, may be imported free of duty.

GUIANA—DUTCH.

Material for the construction and working of telegraph and telephone lines, also apparatus and machines for same, provided such articles be exclusively destined to the purposes named, may be imported free of duty; but the matter is left to the estimation of the Controller of Taxes, from whose decision an appeal may be made to the Minister of Finance.

GUIANA—FRENCH.

Duties are similar to those imposed on like materials imported under the French tariff into the ports of France. Apparatus for telegraph or telephone lines imported on account of the State or Colony are free of duty.

PARAGUAY.

Wire for telegraphs, free of duty, also scientific instruments. No restriction whatever as to marking; packages may be numbered alike when similar in nature. Metric system of weights and measures always used.

PERU.

Each package or piece must bear an individual number, the gross and net weight of each being required in the metric system.

Apparatus, electric or telephonic, and electric batteries, 40 per cent. on an appraised value.

Carbons for electric apparatus, 40 per cent. on an appraised value of 40 centavos per kilogram, gross weight.

Copper wire for electric motors 40 per cent. on valuation of 10 centavos per kilogram.

URUGUAY.

Numbering must be for each individual package. Metric system is employed.

Wire, bronze or copper, 31 per cent. on valuation of 48 pesos per kilogram.

Telephones and telegraphs 31 per cent. on an appraised valuation.

VENEZUELA.

No restriction as to marking. Numbering must be similar for each class of packages. Gross weight must always be stated, and the metric system always employed. Machines and apparatus for electric telegraphing when imported with the consent of the Government are only subject to a duty of .00386 of a cent per kilogram.

AN UP-TO-DATE TELEPHONE SWITCHBOARD.

The following explanation of a switchboard, said to be mechanically and electrically as near to perfection as any ever built for exchange use, will be interesting to anyone who is interested in switchboards. This new board was manufactured by L. M. Ericsson & Co., Stockholm, Sweden, for the Pittsburg Telephone Company of Pittsburg, Kansas, and it is by courtesy of the Ericsson Telephone Company of No. 296 Broadway, New York City, that we show cut of same, and also a diagram of connections.

The illustration shows one section of the board having a capacity of three hundred instruments or subscribers, and arranged with positions for three operators. By adding other sections of the same size the capacity may be increased to 600, 900, 1,200, or any multiple of 300, up to an ultimate capacity of 3,000 instruments. Boards of even larger capacity are

provided with the desired line. If it is busy there is a click heard in the operator's telephone; but if it is disengaged there is no sound, and in that case the plug is placed in the jack and the second subscriber is called by pushing the lever of the table-key toward the board to the ringing position. The table-key returns automatically to its ordinary position and the two subscribers are connected with each other.

When the conversation is finished ring-off signal is given and the clearing-out drops fall and the plugs are removed by the operator.

Each operator has a counter which automatically counts the calls issuing from the exchange.

Six keys marked in pairs are fitted in front of each section. They are used for speaking and ringing to each of the two connected subscribers, separately.

If the operator desires to listen in or to speak to both the subscribers the table-key is pushed into its speaking position; but if connection with only one of them is desired the keys are used. The call is generally given by the table-key, but it can also be given by means of the other keys.

Both the subscribers' and the clearing-out drops are provided with night contact so that the night bell is rung when they are dropped.

THE PITTSBURG (KAN.) TELEPHONE COMPANY'S SWITCHBOARD.

made by the same company, but they vary somewhat from this one, which is a metallic board and full multiple, simple, rapid and positive in operation, readily accessible in every part for connections, changes, or repairs, and in every respect a most durable board. A full multiple board is so arranged that the operator can connect directly any instrument in her section with any other instrument either in her own or any other section, thus giving her command over the whole switchboard. A great saving of time is thus effected over other systems, and to the subscriber this is of the utmost importance.

We will endeavor to explain briefly the details and operation of the board.

For convenience it is divided into five panels and the plugs are placed on two different planes. It is provided with series jacks and the subscribers' drops are restored by the operator. There are eighteen pairs of cords and plugs for each operator, and the clearing-out drops are automatically restored. The lines coming from the cross-connecting board pass through jacks in the first multiple, then continue to the next corresponding multiple. From the multiple jacks the wires go to the soldering tags on the intermediate field on the back of the board. This makes it possible to distribute the labor between the operators, which is done by removing busy subscribers from one operator and placing them with another who has more time. From these tags the wires are connected with the home jacks which are placed on a sloping plane just above the table-leaf, and from there they go to the subscribers' drops.

When the subscriber calls the exchange, the drop falls, and the operator places the answering plug, which is placed on the table-leaf, in the home jack, and at the same time pulls the lever of the table-key toward the edge of the table to the ringing position. After ascertaining the desired number the operator takes the ringing plug, which is on the sloping plane between the subscribers' jacks and the clearing-out drops, and touches the jack in the multiple which corre-

sponds with the desired line. If it is busy there is a click heard in the operator's telephone; but if it is disengaged there is no sound, and in that case the plug is placed in the jack and the second subscriber is called by pushing the lever of the table-key toward the board to the ringing position. The table-key returns automatically to its ordinary position and the two subscribers are connected with each other.

We might add that to be fully understood and appreciated the board should be carefully inspected and the operation, workmanship and finish could then be seen, all deserving attention and the highest praise.

Scales of switchboards have also been made by the same company to the following:

Guthrie Telephone Company, Guthrie, O. T.

Hedrick Telephone Company, Hedrick, Ia.
Crow Telephone Company, Frank Pierce, Ia.
Putnam County Telephone Company, Columbus Grove, O.
Montclair and Bloomfield Telephone Company, Montclair, N. J.

The Company states to us that they have several switchboards on the way for other customers. Some new features in instruments the company will have ready later and we can then call attention to them. While, if you are interested or in the market be sure to write them.

Trade News of Interest.

The American Electrical Works, Providence, R. I., whose advertisement appears elsewhere in this issue, turn out bare and insulated electric light and power wire, besides railway feeder and trolley wire. This well-known concern also manufactures high grade cables for aerial and underground use.

The American Electric Telephone Company, 36 West Jackson Boulevard, Chicago, Ill., manufactures high grade telephone apparatus of every description. This concern, among other things, has recently brought out a new cable terminal with improved stray current protector and carbon arrester, which has met with great success. An attractive catalogue will be sent anywhere upon request.

The Okonite Company, Ltd., 253 Broadway, New York, manufactures Okonite wires, Okonite tape, Manson tape and Candee waterproof wire which, for electrical purposes, cannot be excelled. This concern, which has a world-wide reputation, has taken innumerable medals for its products at all the principal world fairs.

The Norton Electrical Instrument Company of Manchester, Conn., reports a very successful business for the past year. This well-known concern manufactures reliable and accurate measuring instruments, such as voltmeters, ammeters, etc. Persons desiring apparatus in this line would do well to send for a catalogue.

The Babcock & Wilcox Company, 29 Cortlandt street, New York, reports that there has been an unusually brisk demand for its boilers during the year that has just closed. This well-known concern has offices in Havana, Cuba, at 116½ Calle de la Havana, where any information relating to its product may be obtained.

Central station engineers who are having trouble with lubricants would do well to drop a line to the Joseph Dixon Crucible Company, Jersey City, N. J., asking for a pamphlet and a sample of this concern's well-known pure Flake Graphite, which will be sent them free of charge.

The American Lamp and Brass Company, Trenton, N. J., manufactures a new type of lamp known as the "Three-in-One Lamp." The advantage of this lamp is that it may be used in connection with either oil, gas, or electricity. A catalogue may be obtained free of cost on application to the company.

The Farr Telephone & Construction Supply Company, 357 Dearborn street, Chicago, Ill., carries telephones, switchboards and supplies of all kinds. This concern handles Bridging Telephones, Series Telephones, Exchange Telephones, Desk Telephones, Transmitters, Receivers, Brackets, Glass Insulators, Iron Wire, Copper Wire, Annunciator Wire, Batteries, Hooks and everything in the supply line.

Elsewhere in this issue will be found a detailed description of a telephone switchboard manufactured by the Ericsson Telephone Company, 296 Broadway, New York. This concern has turned out telephone apparatus and switchboards, not only for this country, but for the principal European countries as well. A pamphlet descriptive of this well-known company's apparatus may be obtained free of charge at the above address.

F. N. Manross, Forestville, Conn., is said to be one of the largest manufacturers of hair springs in the United States. He makes a full and complete line of hair springs for electric indicating and recording instruments and non-magnetic hair springs of phosphor-bronze and other non-magnetic metals. Mr. Manross also manufactures, to order, hair springs of any description. The excellence of the Manross springs is said to be gaining for the maker an enviable reputation throughout the world as well as a rapidly increasing business, to what an extent may be inferred when it is stated that Mr. Manross is at present engaged in enlarging his factory.

The Wallace Barnes Company of Bristol, Conn., whose advertisement will be found elsewhere in this issue, has just gotten out an attractive catalogue descriptive of the many types of small springs manufactured by this well-known concern. This company has constantly on hand motor springs of every description, clock springs, spiral springs, extension springs and a complete assortment of the best thin-rolled steel. The plant is equipped with the most modern machinery and the facilities for prompt delivery are unexcelled. A catalogue will be mailed anywhere free of charge on request.

La "American Electrical Works," de Providence, R. I., cuyo anuncio aparece en otra parte de este número, ha puesto en el mercado alambre descubierto y aislado con destino a instalaciones eléctricas de alumbrado y de fuerza motriz, así como también alambre de alimentación para ferrocarriles y tranvías eléctricos. Esta bien conocida casa fabrica así mismo cables de superior calidad para instalaciones eléctricas aéreas y subterráneas,

La "American Electric Telephone Company," 36 West Jackson Boulevard, Chicago, Ill., fabrica toda clase de aparatos telefónicos de primera calidad. Esta casa ha puesto recientemente en el mercado, entre otras cosas, una nueva estación terminal para cables eléctricos, que está provista de un protector contra corrientes perdidas y un interceptor de carbón, que ha tenido gran aceptación. Se enviará un detallado catálogo a donde quiera que se pida.

La "Okonite Company, Ltd.," 253 Broadway, New York, fabrica alambres Okonite, cinta aisladora para los empates, marcas Okonite y Manson, y alambre que no se enmohece, marca Candee, que son inmejorables para instalaciones eléctricas. Esta compañía, que tiene fama en todo el mundo, ha recibido gran número de medallas en las principales exposiciones universales como premio a la excelencia de sus productos.

La "Norton Electrical Instrument Co.," de Manchester, Conn., ha hecho muy buenos negocios durante el año último. Esta reputada casa fabrica instrumentos de medición extremadamente exactos,

como voltímetros, amperímetros, etc. Las personas que necesiten aparatos de esta clase, harán bien si piden un catálogo a la mencionada compañía.

La "Babcock & Wilcox Company," 29 Cortlandt St., New York, ha tenido durante el año que acaba de pasar, una extraordinaria demanda de las calderas de vapor que fabrica. Esta renombrada casa tiene establecidas oficinas en la Habana, Cuba, en la calle de la Habana, núm. 116½, donde deben dirigirse las personas que en la isla deseen informes referentes a dichos productos.

Los maquinistas que en las estaciones centrales tienen dificultades con los lubricadores, allanarían pronto los inconvenientes dirigiéndose a la "Joseph Dixon Crucible Company," Jersey City, N. J., pidiéndole que les envíe el folleto sobre "Flake Graphite" (grafito especialmente preparado) y una muestra de éste, que se remiten gratis a quien los pida.

La "American Lamp and Brass Company," Trenton, N. J., fabrica una nueva clase de lámparas conocidas con el nombre de "Three-in-one Lamp" (Lámpara de tres usos). La ventaja de esta lámpara es que puede usarse bien con aceite, con gas ó con electricidad. La Compañía envía catálogo de las mismas a quien lo solicite.

La "Farr Telephone & Construction Supply Company," 357 Dearborn St., Chicago, Ill., tiene gran existencia de teléfonos, tableros de conmutadores y enseres eléctricos de todas clases. Esta Compañía vende Teléfonos Múltiples, Teléfonos para Serie, Teléfonos para escritorio, Centros telefónicos, Transmisores, Receptores, Soportes, Aisladores de Vidrio, Alambre de hierro, Alambre de cobre, Alambre anunciador, Baterías, Ganchos, en fin, todo lo concerniente al ramo de telefonía eléctrica.

En otra parte de este número aparece una detallada descripción de un tablero de conmutadores para teléfonos, fabricado por la "Ericsson Telephone Company," 296 Broadway, New York. Esta Compañía ha vendido gran número de aparatos telefónicos y tableros de conmutadores, tanto para los Estados Unidos como para los principales países europeos. Las personas que deseen un catálogo descriptivo de los aparatos fabricados por la mencionada Compañía, pueden solicitarlo de la misma, y lo recibirán gratis y franco de porte.

Trade News of Interest.

For some time a need has been felt for a good, compact and intelligent work on wiring. Mr. H. C. Cushing, Jr., has met this long-felt want by the issue of a little work entitled "Standard Wiring for Electric Light and Power." As stated in the preface the author has made it his aim to set forth as clearly as possible the essential rules and requirements for safe and economical exterior and interior electric light and power wiring, and how well he has succeeded may be inferred by the immense demand that has already arisen for this work, which retails at the extremely reasonable price of \$1.00. It may be obtained by addressing H. C. Cushing, Jr., 39 Cortlandt street, New York, or by application to this office.

In second-hand electrical and steam machinery Mayo & Rohrer Co., 220 Broadway, New York, have built up a reputation which is second to none. Their method of doing business is such that purchasers of second-hand machinery can rely on their representations. They handle only machinery of high grade and all apparatus is in first-class condition, being thoroughly overhauled before shipment. Being practical electrical and mechanical engineers their guarantee and representations can be relied upon. If you are in the market or have any apparatus for sale we would advise your corresponding with the above company.

The Haines & Noyes Company of Chicago, Ill., have recently put on the market an entirely new design of telephones and switchboards. Their instruments are all of the "Bell" type, as the electrical engineers of this company are all old Bell Telephone Company men, and their experience and ideas gained while there have been used to the greatest possible effect.

These instruments embody the most modern principles, the highest grade of material, and the most skillful workmanship possible, the result of which is to insure the production of the best apparatus ever put on the market.

These telephones excel because—the transmitters are the only absolutely non-packing transmitters in existence (patent applied for). Even water may be poured in them or suction applied without in any way impairing their working qualities. Heat does not affect them, and they are the only transmitters that can be transported long distances and retain their perfect speaking qualities.

This company manufactures all their own silk-wound induction coils used on their telephones, and they guarantee that their coils are the most powerful on the market.

The receivers are of the bi-polar "Bell" type, permanent adjustment, and of the highest efficiency—water shrunk, hard rubber shell, platinum points on all contacts.

The Haines & Noyes Company announce that they have acquired the rights to the automatic self-restoring express switchboard invented by Mr. Holyoke, of the firm of Holyoke & Holyoke, Chicago, and the important improvements made by the former's engineers, make the

"STYLE 21" TELEPHONE.

La "Wallace Barnes Company," de Bristol, Conn., que anuncia en este número, acaba de publicar un bonito catalogo descriptivo de las numerosas clases de muelles delgados que fabrica. Esta bien reputada Compañía tiene constantemente buen surtido de muelles para motores de mano de todas formas, muelles reales para relojes, muelles en espiral, muelles de extensión y un completo surtido de acero delgado laminado. La fábrica de esta casa está provista con la más moderna maquinaria y cuenta con las mayores facilidades para el rápido cumplimiento á las órdenes que reciba. Su catalogo se envía a quien lo solicite.

El señor F. N. Manroos, de Forestville, Conn., está considerado como el fabricante de muelles de pelo que mayor producción ofrece al mercado en los Estados Unidos. Su ramo comprende un surtido completo de muelles capilares para instrumentos eléctricos indicadores y registradores, así como también muelles capilares antimagnéticos de bronce fósforo y otros metales antimagnéticos. El señor Manroos fabrica también cualquier clase de muelles de pelo que se le pida. Los excelentes resultados que estos muelles están dando, han conquistado a su fabricante una reputación universal, así como un rápido crecimiento a sus negocios. Esto último lo comprueba el hecho de estar el Sr. Manroos agrandando sus talleres.

Hacia tiempo que se notaba la necesidad de un buen sistema para la instalación de alambres eléctricos, y esta necesidad ha sido llenada por el Sr. H. C. Cushing, hijo, con la publicación de un libro titulado: "Standard Wiring for Electric Light and Power." Según se dice en el prefacio del mismo, el autor se ha propuesto exponer lo más claramente posible, las reglas y condiciones esenciales para la instalación de alambres con destino al alumbrado eléctrico y fuerza motriz eléctrica, de un modo que ofrezca seguridad y economía, ya sean las instalaciones interiores ó exteriores. Este libro ha tenido gran aceptación, pues la demanda por ejemplares que su autor recibe, es enorme, siendo su precio relativamente muy barato, \$1. Los pedidos deberán dirigirse a Mr. H. C. Cushing, Jr., 39 Cortlandt St., New York, y también pueden hacerse á la administración de este periódico.

Los Sres. Mayo & Rohrer Co., 220 Broadway, New York, se han creado una buena reputación como comerciantes en maquinaria de segunda mano para vapor y electricidad. Su modo de hacer negocios es tan correcto que sus clientes muéstranse altamente complacidos de las transacciones hechas con ellos. Es una casa en la que se puede confiar absolutamente, pues sólo vende maquinaria y aparatos de primera clase, que están en perfecta condición, pues se someten a una escrupulosa prueba antes de entregarlos al comprador. Por ser dichos señores ingenieros electricistas y mecánicos, ofrecen bastante garantía para justificar la confianza de que gozan en el mercado. Todas las personas que necesiten comprar ó deseen vender máquinas y aparatos, encontrarán beneficioso dirigirse a dichos señores.

La "Haines & Noyes Co." de Chicago, Ill., E. U. A., ha puesto recientemente en el mercado modelos completamente nuevos de teléfonos y tableros de conmutadores. Estos aparatos son del tipo "Bell," pues los ingenieros electricistas de esta Compañía han estado empleados en la "Bell Telephone Co." y sus ideas y experiencia han sido aprovechadas ventajosamente. Los citados aparatos han sido aprovechados ventajosamente, están contruidos con material de primera calidad y por muy expertos y hábiles operarios, resultando de esto que son los mejores que hoy existen en el mercado. Estos teléfonos, por los cuales se ha pedido patente, son superiores á cualesquiera otros, porque sus transmisores mantienen constantemente la eficiencia de sus variables resistencias, pues aunque se les inyecte agua ó se les aplique succión, sus buenas cualidades para funcionar no se alteran. Tampoco les afecta el calor, y son los únicos transmisores que pueden transportarse á largas distancias sin que sufran el más insignificante deterioro. Esta Compañía fabrica todas las bobinas que usa en sus teléfonos y las garantiza como las más potentes que hay en el mercado. Los receptores son de la clase bipolar de "Bell" con ajustes permanentes y de la mayor eficiencia, estando provistos de una cubierta de caucho vulcanizado y sometidos á contracción en agua. En todos los contactos tienen piezas de platino. La "Haines & Noyes Co." anuncia haber adquirido los derechos al tablero de conmutadores automático que opera con gran rapidez, inventado por el Sr. Holyoke, de la casa Holyoke & Holyoke de Chicago, y las importantes

Trade News of Interest.

Haines & Noyes new board the simplest, most rapid, and most perfect board in existence (patents applied for).

This company also manufacture the best inter-communicating system for factories, office buildings, hospitals, Government buildings, etc., in the market. The cut of the wall instrument is shown here, while the desk instrument is style 5, shown in their advertisement on page X, used in combination with their new plug box. These systems are the greatest time, labor and money-saving devices of the age. This company makes new and unique telephones for hotels, apartment buildings, ranches, private residences, etc., that are the standard everywhere. Their Mexican, Central and South American trade promises to be very large.

Owing to a constantly increasing demand for its products the Sprague Electric Company, 527 West 34th street, New York, has been obliged to greatly increase the floor space in the New York office which is now located on three floors of the factory. The New York factory is devoted exclusively to the manufacture of the various lines of interior conduit and appliances which have brought the art of electric wiring to an absolute simplicity. The company operates a still larger plant in Bloomfield, N. J., where are manufactured all the light and power apparatus, such as generators, motors, fans, elevators, hoists, etc. A new branch office will soon be opened.

The Safford Arc Lamp, manufactured by the Safford Arc Lamp Company, 301 Washington street, Buffalo, N. Y., has a number of advantageous features which make it a favorite among engineers. Besides being unique in design it is mechanically perfect in construction, and yet is placed on the market at a price that defies competition. For information and prices address the company as above.

Persons desiring up-to-date telephone apparatus would do well to address The Century Telephone Construction Company, 268 Erie street, Cleveland, O., whose advertisement appears elsewhere in this issue. This well-known concern handles telephones of high efficiency and solid construction and a transmitter known as the "Can't Pack," which cannot be rivaled. Communications addressed to the company as above will receive immediate attention.

The American Toll Telephone Company, 51 Sheriff street, Cleveland, O., has recently placed on the market a new type of toll telephone for local and long-distance service which is entirely automatic and devoid of electrical connections. In this system there are no batteries to become short-circuited, no contact points to become oxidized, and yet this type of instrument can be used in connection with any telephone system. Any further information desired may be obtained at the above address.

Elsewhere in this issue will be found a page advertisement descriptive of the unique little electric motors manufactured by Jas. H. Mason, 150 Nassau street, New York. The "Oddo" motor, which sells for \$1, may be utilized to advantage for running fans and other light pieces of machinery. This miniature electric prime mover may be operated with one battery, which makes the cost for current almost nil. For detailed information address Jas. H. Mason, as above.

It may interest electrical manufacturers in this country and dealers in electrical supplies in South America to know that the London & River Plate Bank, Limited, represented by Mr. George O. Gordon, 70 Beaver street, New York City, has branch offices in Para, Pernambuco, Rio Janeiro, Santos, Sao Paulo, Montevideo, Paysandu, Buenos Aires, Rosario, Bahia, Blanca and Mendoza, where letters of credit and cable transfers will be issued, and where bills may be negotiated, advanced upon and sent for collection:

Wireless Fog Signaling at Sea.

Lights and lighthouses are of little use to protect ships from collision and shipwreck in case of dense fogs. Great expectations have been formed of the use of electric wave telegraphy for this purpose, and a trial recently made at Southend with a system devised by Col. Hozier and Mr. Neville Maskelyne seems to justify these expectations, says the London "Electrical Review." A transmitting station

was established on shore near the danger point, and signals were sent out by an automatic apparatus, consisting of a revolving wheel, whose periphery is cut into teeth of varying size. This wheel takes the place of the operator at the Morse key, and transmits the name of the place in a series of dots and dashes in the Morse code. The wheel is driven by an electro-motor or other convenient means, and it can be arranged to signal every minute or two, or continuously.

Any vessel fitted with receiving apparatus coming within the range of the transmitter will be warned by the ringing of a bell, and will receive a Morse signal of the name of the transmitting station. In the trials at Southend the vessel was fitted with a vertical conductor, 50 to 60 feet in height, and the warning signal was received at a distance of seven to eight miles. No satisfactory method of indicating the direction of the source of radiation appears to have yet been devised.

mejoras en el mismo introducidas por los ingenieros de la "Haires & Noyes Co." lo ha convertido en el más simple, el más rápido y el más perfecto que existe. Se ha pedido patente por este tablero. Esta Compañía fabrica también el mejor sistema para comunicación interior en las fábricas, edificios públicos, hospitales, oficinas del gobierno, etc. El grabado que acompaña estas líneas representa el teléfono de pared, y en el anuncio de dicha casa que aparece en la página X se verá el teléfono de escritorio, que es estilo 5, y que se usa en combinación con el tablero de conexiones. Estos sistemas son los que mayor ahorro de tiempo, de trabajo y de dinero facilitan actualmente. Esta Compañía hace unos teléfonos nuevos y exclusivos para hoteles, casas de pisos, ranchos, para familias, etc., que han recibido la preferencia dondequiera que se conocen. Los negocios de esta casa con México y las Américas Central y del Sur, prometen ser muy extensos este año.

La "Sprague Electric Company," 527 West 34th St., New York, se ha visto obligada a ampliar el espacio ocupado por sus oficinas en esta ciudad, las cuales se hallan establecidas en tres pisos del edificio en que está la fábrica. Los talleres de Nueva York están dedicados exclusivamente a la fabricación de las varias clases de conductos para instalaciones de alambres en el interior de las paredes, y enseres para esta clase de trabajo, el cual se simplifica extremadamente con dichos conductos. La Compañía tiene una fábrica mayor en Bloomfield, N. J., donde se hacen aparatos para alumbrado eléctrico y para fuerza motriz como son, generadores, motores, abanicos eléctricos, ascensores eléctricos, grúas eléctricas, etc. Pronto abrirá una nueva sucursal.

La lámpara de arco marca Safford, fabricada por la "Safford Arc Lamp Co.," 301 Washington St., Buffalo, N. Y., ofrece numerosas ventajas que son grandemente apreciadas entre los maquinistas. Además de ser, de dibujo exclusivo, su construcción mecánica es perfecta, y no obstante su superioridad, se le ha puesto un precio que no admite competencia. La mencionada Compañía dará otros informes y precios a solicitud de los interesados.

En este número aparece una página en que se anuncia y describen los pequeños motores eléctricos especiales fabricados por Jas. H. Mason, 150 Nassau St., New York. El motor "Oddo" que se vende por \$1, puede usarse convenientemente para mover abanicos eléctricos y otros aparatos ligeros. Este motor primordial, en miniatura, funciona con una batería, lo cual hace que el costo de la corriente sea insignificante. Para más detalles dirigirse al mencionado fabricante.

La "American Toll Telephone Co.," 51 Sheriff St., Cleveland, Ohio ha puesto a la venta un nuevo tipo de teléfono que funciona de igual manera que esas máquinas automáticas en las que se echa una moneda por una ranura a propósito, y proporcionan música, vistas panorámicas, etc. Este aparato se adapta para corta y larga distancia y es completamente automático, evitando las conexiones eléctricas. En este sistema no hay baterías cuyos polos vengan en contacto, ni puntos de contacto que se oxiden; no obstante, es un aparato que puede usarse en cualquier sistema telefónico. Los detalles sobre el mismo pueden obtenerse dirigiéndose a la citada Compañía.

Las personas que deseen adquirir aparatos telefónicos de los más perfeccionados, harán bien en dirigirse a "The Century Telephone Construction Company," 268 Erie Street, Cleveland, Ohio, cuyo anuncio se verá en la sección correspondiente de este número. Esta acreditada casa vende teléfonos de clase superior y de sólida construcción, y un transmisor conocido por "Can't Pack", que no tiene rival; así como también tableros de conmutadores y enseres eléctricos de todas clases. Enviará su catálogo gustosamente a quien lo pida.

THE TELEPHONE WORLD

Fine 'Phone Facilities in Chicago.

To one who has known the Chicago Telephone Company from its modest beginning in 1876, and has since had occasion to watch its growth, both in extent and efficiency, it is indeed a marvel. Then its subscribers numbered but a few hundred, now it has more than 85,000 subscribers in that and surrounding cities. Then its methods were comparatively simple and crude; now the most costly innovations have been made, every possible improvement and convenience has been added, and it begins the twentieth century with one of the largest and best equipped telephone plants in the world.

The Chicago Company has to day in use about 70,000 miles of wire, very much the largest part of which in the business portion of the city is in cables carried in underground conduits. Formerly a single wire was used, grounded at each end. Now two wires are always used, making a complete circuit for each subscriber. To handle the business so rapidly increasing the latest and most improved and expensive apparatus must be used. During the last two or three years the company has been installing in its various offices what is known as the relay multiple switchboard, which radically changes and at the same time greatly simplifies the method of making a connection, the operator being enabled by a series of small incandescent lights to tell when the 'phone is in use and when it is no longer desired. The use of all this new apparatus and the enormous growth of business has called for corresponding increase in operating space. To meet this demand the company has been compelled to build an addition to its main plant, more than doubling its size and capacity. Here the new operating room, where the calls are answered and connections made, is undoubtedly the finest and best equipped, as well as the largest in the world.

It is said in Wyandotte, Mich., now that the Detroit and Michigan telephone exchanges will be consolidated under Manager John McInnes, a new company known as the United States Telephone Company will solicit subscribers and install an independent telephone exchange. It is proposed that it shall be identified with the Martin telephone scheme in Detroit. J. W. Martin who has secured a telephone franchise in Detroit, has lately announced that business 'phones will be \$38 instead of \$40, as authorized. He says arrangements have been made to float \$600,000 of bonds to build a plant, if he gets 8,500 subscribers.

A new telephone line will be run northeast of Washington, Ia., the coming spring for several miles in the country. An enthusiastic meeting was held by the farmers a short time ago, and twenty-three pledged themselves to pay for 'phones. The line will be put in by the Washington County Telephone Company and farmers will be able to talk to neighboring cities without having messages transferred. A similar line has been southwest of the city for some time.

The first formal meeting of the Melrose, Fla., Telephone Company, was recently held. The officers elected were: Dr. J. B. Curtis, president, and Rev. A. H. Waters, secretary and treasurer. The president presented a report showing that a sufficient fund had been subscribed to construct the proposed line from Melrose to Waldo via Orange Heights in that State. It was, therefore, resolved that the work be commenced at once, and continued until completed. The distribution of the poles has already begun.

The Bloomfield, Ia., Mutual Telephone Exchange has been sold to Hon. Amos Steckel, of Bloomfield. The transfer was made in the interest of the Southeastern Iowa Mutual Telephone Association. To the city of Ottumwa it provides the connecting link to all of the Mutual telephone lines in Southeastern Iowa and Northeastern Missouri. For the reason that a vast amount of capital has been interested, it also means that within the next twelve months Davis County and several other counties in Northeastern Missouri will be simply covered with a network of telephone wires, as the many extensions planned will now be built.

The Iowa Telephone Company will build a copper metallic circuit from Sioux City to Des Moines. It will be completed by June 1. The line will be constructed as far as Fort Dodge along the line of the Illinois Central Railroad, and connection will be made at Fort Dodge with the eastern copper metallic circuit. The Sioux City copper metallic circuit to Missouri Valley will be extended along the Chicago & North-western Railroad to Boone. These new lines will give Sioux City superb talking connection with the East and South-east.

The telephone system in Athens, Ga., though a good one is to be vastly improved. Work is to be begun at once on the improvements, and in a few months no city in the South can boast of a more complete service.

'Phone Charges Fixed in Mississippi.

The Railroad Commission of Mississippi, has passed an order supervising charges for telephone messages and rent of 'phones. The maximum rates in the county are fixed at 25 cents; in the State, \$1. Maximum charge for residence phones, \$2; minimum, \$1. Business 'phones, \$4 per month. The order was hotly contested by the Cumberland Company.

Thomas McCorkle, the president, and Capt. Frank Wood, the superintendent of the Delmarvia Telephone Company in Wilmington, Del., were among the invited guests at the inspection of the new switchboard and plant of the Maryland Telegraph & Telephone Company in Baltimore. After an inspection of the plant they do not hesitate to say it is one of the most complete telephone exchanges in operation. It is a central energy, multiple system and up to date in all its appurtenances. In the selection of the Kellogg switchboard and instruments they think Baltimore may congratulate itself in having a service which will be unexcelled. The rates are reasonable and the service superior. In a short space of time the new company has accomplished what it took the old company years to achieve.

A meeting of the Columbia Long Distance Telephone Company was held recently. The stockholders are the same as those of the Syracuse, N. Y., Telephone Company. The following officers were elected for the ensuing year: President, J. J. Jermyn; vice-president, E. I. White; secretary, George H. Bond; treasurer, A. R. Peck; general manager, R. G. Jermyn. It was reported that ninety-five cities and towns had been connected and that by September 1 next subscribers could be able to communicate with New York City. The improvements which are to be made in the Snow building will increase the capacity of the plant about 50 per cent.

Certificates announcing the election of directors for the Rochester, N. Y., Telephone Company were recently filed in the County Clerk's office as follows: Frederick Cook, George W. Archer, H. Wheeler Davis, George R. Fuller, J. F. Warner, H. C. Brewster, T. W. Finucane, Albrecht Vogt, Gustave Erbe, Jacob Gerling, Edward W. Peck, Eugene H. Satterlee, W. B. Spader, E. M. Higgins and V. Moreau Smith.

A syndicate that is buying up the stock of the Standard Telephone Company will extend the system to Colmar, Bristol and Quakertown, Pa., besides making connections with the Interstate and Keystone Companies so as to cover Montgomery County. There have been dissensions in the board of directors of the Standard Company, and the new move is part of a reorganization scheme.

The New York & New Jersey Telephone Company commenced last week to lay a new underground cable on Flatbush avenue, Brooklyn. By this means the company will remove its wires from the poles where they are in danger of contact with the electric light and fire alarm boxes, and also hope to give a better service.

The negotiations which have been quietly pending for some time at Corydon, Ind., between Louisville and Cleveland and Quakertown, Pa., besides making connections with the Interstate and Keystone Companies so as to cover Montgomery County. There have been dissensions in the board of directors of the Standard Company, and the new move is part of a reorganization scheme.

The subject of another telephone company for Salt Lake City and the other important cities of Utah is again being agitated. The local promoter of the enterprise is Attorney Elmer B. Jones. He states that the new company will be called the Utah Home Telephone Company and that most of the capital for the undertaking will come from Chicago.

Boise City, Idaho, has a telephone service that is superior in every way. Two companies are operating there. The Rocky Mountain Bell Telephone Company also has a fine plant, and the Independent Telephone Company is unexcelled anywhere. The use of the long-distance telephone is constantly increasing.

A deal has been consummated by which the Cumberland Telephone Company, of Nashville, Tenn., through its agent, Mr. Siegel Bronner, will absorb the Carlisle, Ky., Telephone Company. The Carlisle Company, it is understood, besides receiving a good stiff price for its plant, has also dictated the charges to be made by the new owners.

The Missouri & Kansas Telephone Company has established a district, to be known as the Oklahoma district, and appointed J. W. Wilson, of Oklahoma, Okla., as district manager; he will have control of all of the plants of the company in the Indian Territory and Oklahoma. The company announces that it is about to begin the construction of several hundred miles of new toll lines in the two territories.

The telephone line between West Point and Oakland, Neb., was opened for business a short time ago. Numbers of farmers on the route have availed themselves of the privilege of telephonic connection with both towns. Rates between the two places have been reduced 60 per cent. and the same reduction made to all points on the Chicago, St. Paul, Minneapolis & Omaha systems.

Drafts have been sent out by the State Auditor of Minnesota on the telephone companies of the State for the 1900 gross earnings tax, which amounts to \$25,450.73, and includes forty-five companies. The Northwestern which operates in the twin cities paid \$18,669.08. The Mississippi Valley Company paid \$512.30.

The Maryland & Delaware Telephone Company, which was recently chartered in Dover, Del., and is composed of a company of Baltimore capitalists, will at once begin the construction of its line through that section.

The Keystone Telephone Company, which is backed by a number of Philadelphia capitalists, has filed a certificate with the Secretary of State, increasing its capital stock from \$2,000,000 to \$10,000,000.

The telephone line from Romney to Capon Bridge, W. Va., has been sold by the Cordon Telephone Company to Dr. E. M. Oats and his brother, of Capon Bridge. The new purchasers will rebuild and improve the line.

The project of the new building for the Central Union Telephone Company in Youngstown, O., is shortly to assume definite form. It will be a model up-to-date office building, one that will meet the needs of the business of the exchange.

It is stated that the Erie Telephone system made a net gain of 2,278 subscribers in December, and of 35,041 for the year. The total number connected December 31 was 141,599 and the number awaiting connection 2,924.

Stock is being subscribed for in the interest of a new telephone company connecting Jackson and North Jackson with Susquehanna, Montrose, Pa., and Binghamton, N. Y. via Thomson, Pa.

McKeesport, Pa., will have two telephone lines to Pittsburg after February 1, according to the announcement made by an official of the Federal Telephone Company.

Blue Rapids, Kan., will put in a telephone exchange, operated by Dr. E. Armstrong of Greenleaf, who already operates two other exchanges, one at Greenleaf and the other at Stockton in that State.

A new switchboard, with the most improved equipment at a cost of \$100,000, has lately been installed by the Bell Telephone Company of Buffalo, N. Y.

The people of Hillsboro are trying to get a telephone line to Monticello, Ga.

Decaturville and Clifton, Tenn., are now connected by telephone.

The Cumberland Telephone Company has purchased lines in Sullivan County, Tenn.

TELEPHONE INCORPORATIONS.

The Colonial Telephone Company, Newburg, N. Y. Capital stock, \$125,000. Directors: Harry A. Bartlett, V. Schoonmaker and W. G. Taggart, all of Newburg.

The Cattaraugus Telephone Company, Cattaraugus, N. Y. Capital stock, \$1,000. Directors: S. F. Burger, Frank Crawford and H. B. Easton, all of Cattaraugus.

The Overland Telephone Company, Lehigh, Pa.—to erect telephones. Capital stock, \$15,000.

The Citizens' Telephone Company, Frederickburg, Md. Capital stock, \$5,000. Incorporated by H. M. Whitney, E. D. Anthony, E. L. Graham and others.

The Moosehead Telephone Company, Greenville, Me.—to maintain telephone lines around Moosehead Lake. Capital stock, \$10,000. Officers: President, Charles D. Snow, of Greenville; treasurer, Charles A. Judkins, of Kinto.

GENERAL ELECTRICAL NEWS.

Lighting.

Atlantic, Ia.—The electric light plant here is to be substantially improved.

Blairtown, N. J.—The Blairtown Electric Light Company has purchased the water rights at the outlet of Swartwood Lake, and in future dry seasons this will be used to run the plant.

Brocton, N. Y.—This place is to have an electric lighting plant. If the village does not care to install it, residents will do so, giving the municipality the privilege of purchasing any time it sees fit after giving a year's notice.

Chestertown, Md.—The Chestertown Electric Light Company has been formed, with King Wright of Philadelphia as manager.

Chippewa Falls, Wis.—The plant of the Chippewa Falls Lighting Company is being enlarged to double the present capacity to supply power to the Chippewa Valley Electric Railway Company's road.

Columbus, O.—The board of education is discussing the question of erecting its own electric light plant in the new school building soon to be built.

Creston, Ia.—A movement has been started to organize a local electric light company.

Ellicott City, Md.—The Ellicott City Power & Electric Company's plant has been purchased by G. L. Mowen of Baltimore. The plant is to be improved.

Ellsworth, Wis.—The Ellsworth Electric Light Company has sold its plant to Willay & Buck, of Elroy, Wis.

Farmington, Mich.—The citizens will soon hold an election to vote on the question of bonding for an electric lighting plant.

Ft. Smith, Ark.—Geo. Tilles, of 1 Tilles Corner, Ft. Smith, wants to purchase electric light machinery.

Holgate, O.—The citizens of this place are agitating the question of erecting a new electric light plant.

Kendallville, Ind.—The city council has appointed a special committee to inquire into the feasibility of the city operating an incandescent electric light plant.

Magnolia, Ark.—An electric light plant is being talked about for this place.

New York City.—Sealed bids on estimates will be received by the committee on buildings of the board of education of this city at the hall of the board, southwest corner of Park avenue and 59th street, on January 21, for installing an electric lighting plant, fixtures and electric bell system for new public school 131, east side of Fort Hamilton avenue between 43d and 44th streets, Brooklyn.

Paducah, Ky.—The Paducah Electric Light Company has raised its rates 25 per cent. and aroused dissatisfaction, which is manifested in a subscription to secure another light plant.

Pierce, Neb.—The citizens are discussing the advisability of voting bonds for an electric light plant.

Plainfield, N. J.—Councilmen Valliant, Rogers and Lee have been appointed a committee to investigate the advisability and estimated cost of establishing a municipal electric light plant.

Rockwood, Tenn.—(On January 25 the citizens will be called upon to vote on the proposition of issuing \$25,000 in city bonds, the proceeds to be used for putting in a waterworks system and electric light plant.

Salida, Col.—The Edison Electric Light Company is perfecting plans for greatly increasing its plant.

Seattle, Wash.—The street lighting of this city will be done entirely by electricity this year.

Shreve, O.—The citizens of this place are organizing an electric light company to be capitalized at \$5,000. The greater part of the stock has been subscribed.

Steubenville, O.—The Steubenville Electric Company is replacing all the old style arc lights with the latest patent light.

Weiser, Idaho.—A new electric light plant will soon be erected here.

Woodstown, N. J.—Electric lights are again being talked of for this place, to be operated in connection with the cold storage plant to be erected here.

Waterbury, Conn.—The board of public works has passed a vote recommending to the board of aldermen

that this city be empowered to issue \$100,000 in bonds for installing an electric lighting plant.

Zacoalco, Mex.—A new electric light plant is being installed in this town.

Street Railways.

Auburn, Cal.—The Auburn Electric Railroad Company has been incorporated with \$50,000 to construct and operate electric street railways here. The directors are A. S. Moore, B. F. Hartley, J. H. Wills and P. C. Moore.

Bucyrus, O.—The Buckeye Traction Company of this city was lately incorporated for the purpose of building an electric line from here to Norwalk via Annapolis, New Washington and Chicago Junction.

Everett Wash.—The Everett Railway & Electric Company has decided to make extensive improvements on its system.

Cameron, Mo.—A new company is to be organized at this place to build an electric road from this city to Kansas City. The promoters of the enterprise contemplate building the road via Lathrop, Holt, Kearney and Liberty.

Clinton, Ind.—A movement is on foot to build an electric road between Paris, Ill., and this place. Congressman Andrew J. Hunter of Paris is behind the project.

Delhi, N. Y.—The citizens here are talking of building an electric road to Bloomville. The silk mill and its engines would make a good power plant. All that is lacking is the money to build the road and equip it.

Ft. Wayne, Ind.—The Ft. Wayne & Southwestern Traction Company of Ft. Wayne and Allen County was recently incorporated for \$400,000 by G. Townsend, W. S. Reed, F. G. Morehouse and C. C. Miller.

Havre de Grace, Md.—The Belair & Havre de Grace Electric Railway Company has accepted the ordinance of the city council of Havre de Grace authorizing it to lay tracks and operate an electric railway upon certain highways of this city.

Indianapolis, Ind.—Arrangements have been completed for the construction of an electric railway by the Indianapolis, Morristown & Rushville Traction Company.

Macon, Ga.—W. B. Sparks and others have organized the North & South Macon Street Railway Company to build an electric line in the city and suburbs.

Marysville, O.—This place is soon to have an electric road through Union County connecting with Richwood, Magnetic Springs and Delaware. T. N. Kerr of Columbus is the promoter.

Santa Ana, Cal.—A franchise has been granted for the construction of an electric road from here to Los Angeles, through Whittier.

Santa Fe, N. M.—M. W. McGrath is the promoter of the Santa Fe Electric Street Railway soon to be constructed.

San Bernardino, Cal.—S. Hartley of Colton has purchased the franchise granted by the city trustees last August to Judge J. L. Campbell for an electric street railroad.

Wausau, Wis.—The business men of this place and Merrill are contemplating the building of an electric road between these cities.

Manufacturing.

Brooklyn, N. Y.—The World's Life Protecting Car Fender Company of this city has recently been organized, and it proposes to manufacture and sell fenders for cars propelled by electricity, compressed air or other motive power on a capital of \$20,000. The directors for the first year are Montgomery Queen, Henry D. House and George Haring, all of Brooklyn.

Dayton, O.—The Dayton Electrical Manufacturing Company has increased its capital stock from \$20,000 to \$50,000. H. G. Catuw is president, and C. C. Hoover secretary of the company.

McKeesport, Pa.—Preparations for the erection of a large addition to the National Tube Works in this city are being made. The new department will be de-

voted exclusively to the manufacture of steel and iron trolley poles for street railway use.

Peoria, Ill.—The Thayer Electric Company has been formed here for the purpose of manufacturing electrical machinery with a capital stock of \$25,000. R. Lester Thayer, Louis R. Van Nuys and C. B. Murray are the interested parties.

St. Louis, Mo.—John S. McKinley, Frank R. Harris and Frank L. Horton are the stockholders of the Imperial Electric Plating & Manufacturing Company recently organized here with \$5,000 capitalization.

Waterbury, Conn.—The Waterbury Electric Company of 48 Jefferson street, manufactures a specialty of an electric heat regulator for dwellings and offices, which is used either with steam, hot air or hot water furnaces and regulates the fire automatically, preventing overheating of furnaces and maintaining a uniform temperature at all times.

Company Matters.

Bellows Falls, Vt.—The Bellows Falls Electric Light Company was succeeded lately by the Fall Mountain Electric Light & Power Company. The new company has a capital stock of \$100,000. There is a probability that later there will be important additions and improvements to the plant.

Delta, Pa.—The Delta Electric Power Company is having a number of inquiries for supplying electric power to concerns now using steam or about to commence business.

Ft. Scott, Kan.—The Fort Scott Electric Light & Power Company, the Citizens' Street Railway Company and the Fort Scott Steam Heating Plant were recently consolidated under a new corporation to be known as the Fort Scott Consolidated Supply Company, capitalized at \$250,000. Grant Hornaday is president of the concern.

New Haven, Conn.—The Connecticut Electrical Company of this city recently made a voluntary assignment in the Probate Court for the benefit of its creditors and named John T. Manson as trustee.

Power and Transmission.

Salt Lake City, Utah.—The Utah Construction Company is now working on the dam planned by C. K. Bannister to utilize the waters of Weber River to generate electric power at a power house to be located about one-fourth of a mile below the Union Pacific bridge.

Yolo, Cal.—The Bay Counties Power Company, the \$5,000,000 electrical plant established in Yolo County, is nearly ready for business. Its double-pole lines will run through Yolo, Solano, Contra Costa and Alameda Counties to Oakland. Sub-stations will be established at various points along the line and all the cities and towns near the line will be supplied with both electric lights and power.

Weymouth, N. J.—George Pfau, of Riverside, who is generating electricity by water power here has obtained permission from the Landis township committee to erect poles for the running of wires to Vineland, where he intends to furnish electric power for manufacturing purposes.

Mines.

Marysville, Mont.—A new series of electrical power drills was purchased a short time ago by the Big Ox Mining Company for operation in its mine near this place. This machinery is rapidly being installed, and will shortly be ready for operation.

Automobiles.

New York City.—The Progressive Cycle & Automobile Supply Company of this city was formed lately to deal in bicycles and automobiles on a capital of \$6,000. George Herrnstadt, W. S. Hofstatter and Elias Pitzele, have an interest in the firm.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

 a Leased to Hestonville, Man. & Fairmount Passenger Ry. for 6% on stock per annum.
 b Consolidation Electric, People's and Philadelphia Traction companies. Fixed charges and all indebtedness of constituent and leased companies assumed by Union Traction Company.
 c Practically all shares owned by Union Traction Company.
 d Lease to Frankford & Southwark Passenger Ry. assumed by Electric Traction Co.
 e Leased to Electric Traction Company.
 f Controlled by Frankford & Southwark Passenger Railway.
 g Leased to People's Passenger Railway at \$5 per share.
 h Majority of stock owned by People's Traction Company.
 i Lease to Union Traction Company.
 j Lease transferred to Union Traction Company.
 k Leased to Union Traction Company at a rental of \$10,000 per annum in 1896-7-8.
 l In 1899-1900 and \$30,000 per annum thereafter, payable semi-annually, rental declared as a dividend semi-annually.
 m Dividend of 10% guaranteed by Reading Traction Company.
 n Dividend of 6% guaranteed by Reading Traction Company.
 o Leased and operated by the Seranton Railway Co., formerly Seranton Traction Co.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¼c.; Lake, 16½@17c.; casting, 16½@16¼c.

The Chicago Edison Company has declared the regular quarterly dividend of 2 per cent., payable February 1.

The Electric Company of America has declared a semi-annual dividend of 50c. per share, payable January 31.

The American Telephone and Telegraph Company has purchased for \$500,000 Prof. M. Pupin's invention for submarine telephoning.

The Northern Ohio Traction Company has bought the Akron & Cuyahoga Falls Rapid Transit Company. The price is over \$500,000.

The annual meeting of the American District Telegraph Company will be held January 24. Books close January 17 and reopen January 25.

It is rumored that the Widener-Elkins syndicate has practically secured control of the Cincinnati Street Railway Company; it is said that 51 per cent. of the stock has been secured.

The Gas and Electric Company of Bergen County, N. J., reports for the period June 1 to December 31, gross earnings, \$140,190; operating expenses, \$87,524; net earnings, \$52,665.

The Brooklyn City Railroad Company has declared the regular quarterly dividend of 2½ per cent., payable January 15. Books closed January 10 and reopen January 16.

Directors of the United Traction Company, of Pittsburg, Pa., have declared the regular semi-annual dividend of 2½ per cent. on the preferred stock, payable January 21.

The Appellate Division has fixed the amount of property of the Brooklyn Rapid Transit Company taxable in this State, for State purposes, at \$34,907,561, and the tax thereon at \$53,499.

The Massachusetts gas and electric light commissioners are quoted as strongly opposed to the contemplated absorption by J. P. Morgan of the Boston and Edison electric companies on the basis proposed.

The Fitchburg & Leominster Street Railway Company has petitioned the Massachusetts Railroad Commissioners for authority to issue \$300,000 20-year 4½ per cent. coupon bonds, payable semi-annually.

The Cincinnati, Hamilton & Dayton, Ohio, Railway Company has declared the regular quarterly dividend of 1½ per cent. on its preferred stock, payable February 8. Books close January 24 and reopen February 9.

According to a press report the Whitney-Widener-Elkins syndicate is endeavoring to secure control of the gas and electric light plants of Hamilton, O., presumably in the interest of the United Gas Improvement Company.

The New York "News Bureau" says it is understood that Consolidated Railway, Electric Light & Equipment Company has completed a contract with Vicker, Sons & Maxim, of London, for the handling of the company's foreign business.

The Wheeling W. Va., Traction Company has filed a deed of trust to the Western Reserve Trust Company, of Cleveland, O., for \$2,500,000 of bonds, to be issued by the newly consolidated railway. The bonds will run thirty years and bear 5 per cent. interest.

The Northwestern Elevated Railroad Company of Chicago reports for the seven months ended December 31: Gross earnings, \$525,023; operating expenses, \$180,451; net earnings, \$344,571; fixed charges, \$221,553; surplus, \$123,018. Earned on preferred stock, 2.46 per cent., which is equal to 4.2-10 per cent. per annum.

Although there is much talk of a Metropolitan-Manhattan alliance, says the Boston "News Bureau," the buying of the latter stock seems to come from Gould-Sage interests rather than from the Whitney-Ryan contingent. It is believed, furthermore, that if there is any Whitney buying in the tractions it is confined to Brooklyn Rapid Transit.

The directors of the Edison Electric Illuminating Company of Boston have declared a regular quarterly dividend of 2 per cent. and 1 per cent. extra, payable February 1. The previous quarterly dividend was 2 per cent. and 1 per cent. extra. If this distribution is continued, it will place the Edison Company's stock on a 12 per cent dividend basis.

At a meeting in Boston on January 10 the directory of the Erie Telephone Company was increased to 25 members. Nine of the directors retired, and the following eleven new directors were added: Gordon Abbott, Walter Abbott, Philip Dexter, Wm. Endicott, Jr., Reginald Foster, Elmer E. Foye, Thos. J. Hopper, Francis R. Hart, Jas. A. Parker, Edw. A. Phippen, Jos. G. Stearns.

Regarding reports that the Massachusetts Electric Companies has been looking over the Haverhill, Merrimac & Amesbury Railway and the Citizen's Street Railway Company of Amesbury, Mass., Manager Sullivan of the Massachusetts Electric Companies says: "We are not looking over any road with a view to purchase. We are not in the purchasing line. We are satisfied with what roads we have and are devoting our attention to putting our roads into a cohesive system."

A large stockholder in the Metropolitan West Side Elevated Railway Company of Chicago is reported as saying: "It has always been the policy of the company to pay to stockholders what has been earned. The road has earned 14-10 per cent., not including the earnings of January and February, applicable to the preferred stock, for the last six months of the current fiscal year, which ends February 28, 1901. The company will pay not less than 1½ per cent., no more than 20 per cent. early in February, covering the last half of the year."

ELECTRICITY.

VOL. XX.

NEW YORK, JANUARY 23, 1901.

NO. 3.

ELECTRICITY.

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.

EDITORIAL NOTES.

The Northwestern Electrical Association Convention.

Elsewhere in this issue
will be found in detail
the proceedings of the
Northwestern Electrical
Association Convention,
which was held in Mil-

waukee, Wis., on January 16, 17 and 18.

As usual a number of exceedingly instruc-
tive papers were presented, which elicited in-
teresting discussions. The committee appointed
to examine into the courses in the various corre-
spondence schools made its report, and among
other things recommended that the correspond-
ence schools referred to be individually re-
quested to reorganize their courses for central
station employes to conform more nearly to the
actual requirements. This idea of reporting
on the methods of correspondence schools is an
excellent one, and was gone into quite thor-
oughly by ELECTRICITY a few years ago.

At the recent Milwaukee Convention, it was
decided to hold a summer meeting, probably
in June, at Sheboygan, Wis., which is situated
on Lake Michigan. The plan of holding such
a gathering is a good one as it affords the
members an opportunity of enjoying a pleas-
ant outing, while reaping at the same time
benefit in a professional way. That these sum-
mer meetings are most enjoyable, can be testi-
fied to by all those who were fortunate enough
to have participated in the trip through the
lakes a few years ago.

At the Convention just drawn to a close the
attendance was large, while the social fea-
tures were everything that could be desired.

The New Tariff in San Salvador.

Central America, more liberal in some of its
arrangements than preceding tariffs. A note-
worthy feature of the new tariff is that the
duties under it are assessed upon a gross
weight. All invoices must be made out in
Spanish; must include the name and residence
of the shipper and of the consignee; the marks
of the packages; the number, weight and kinds
of goods; the gross and net weight in kilograms;
the value of each article in its country of ori-
gin, together with the total value of the ship-
ment. Incomplete invoices are not accepted,

and two or more packages on the same invoice
must not be of the same number.

The duties on electrical equipment are as
follows: Electric motors, 18 cents per 100
pounds; magnets, 18 cents per 100 pounds; arti-
cles, apparatus, machinery, tools and materials
for telegraph and electric lights, 18 cents per
100 pounds, and an exemption from the surtax
of 55 cents per 100 pounds, additional for pub-
lic debt, to which all articles not specifically
exempt are subjected; carbide of calcium, ad-
mitted free; graphite or plumbago, in powder,
\$1.84 per 100 pounds; globes and illuminating
sundries of all kinds, \$4.60 per 100 pounds;
telephones, electric bells, small electric ma-
chines and parts, \$5.52 per 100 pounds; mica,
92 cents per 100 pounds; mining apparatus, free,
if imported on an order obtained from the Min-
ister of Finance. Thirty percent. additional is
charged on the total amount of duties for
charitable purposes.

In addition to the foregoing provisions for
electrical apparatus a contract was entered
into between Carlos Melendez and the Govern-
ment of Salvador, by which he enjoys the
privilege of importing free of all duty, until
1905, all kinds of electrical machinery and fit-
tings, and all wire cables. But such goods
must be covered by an invoice describing them
minutely, and it is understood that such goods
so imported are to be used in works estab-
lished by Melendez.

* * *

No Electric Street Railways in Operation in London.

It is hard for residents
of New York city to
realize the backward
condition of London in
the way of up-to-date
methods of surface
transportation. While this city enjoys many
miles of electric conduit roads, according to our
London correspondent, the people of the English
metropolis are content to journey to and from
their places of business in lumbering 'busses.
In short, no electric street railways are yet in
operation in any part of London. Referring to
this condition of affairs our correspondent
states that if it were not for the activity in
underground electric railways the electric trac-
tion engineer would find the English metropo-
lis, of all places, the most disappointing. The
lines of the London United Tramway Company
in West London, though quite completed, are
still not allowed to run on account of the trou-
ble with the magnetic observatory at Kew. A
series of experiments have been proceeding

lately under the joint direction of the Kew Observatory authorities, the Board of Trade and the Tramway Company with a view to ascertaining the exact extent of the interference. Mr. Robinson of the Tramway Company expects that an agreement will shortly be arrived at and that the cars will be allowed to run.

The London County Council has definitely decided upon an electric conduit system for certain central thoroughfares. It has been expressly designed by Professor Alexander Kennedy for the purpose, and now merely awaits approval of the Board of Trade and the local authorities through whose districts the lines will be run.

A company which is to lay electric lines in the southeastern district, round Greenwich way, proposes to employ the Schuckert surface contact system, which has been under somewhat prolonged trial at Munich, and is now being exploited in England. Rumor also has it that there is shortly to be another trial made in London with accumulator trams. Recent battery traction history does not give the proposal a very rosy aspect, unless the promoters have something exceptional in the way of a battery.

A Method of Preparing Sugar by Electrolysis.

The electric current is every day growing more important in industry, as new applications for it are found. Not so

very many years ago about the only practical use made of electricity was in lighting, while at present it drives machinery of all kinds, bores holes in armor plates, is utilized in the pressing of cloth and refines copper. In an interesting paper presented at the recent Congress of Applied Chemistry at the Paris Exposition M. Dupont pointed out another important use for the electric current and set forth at considerable length the result of his researches on the subject of the preparation of and the extraction of the many kinds of sugar by means of electrolysis.

The electrolytic apparatus which he used in his researches was, in the main, composed of a wooden vat divided into three compartments by porous partitions: the electrodes were metallic plates of various kinds, according to the results he wished to obtain.

The electric current employed was from 14 to 15 volts and with a volume varying from 25 to 30 amperes per square meter of the anode.

In the preparation of sugar from beets and from sugar-cane the juice is placed in the middle compartment of the electrolyzer and water in the two end compartments. A plate of lead or aluminum used as an anode is placed in the sugar juice and sheet-iron plates are placed in the water compartment to serve as cathodes.

The albuminoidal matter of the juice is coagulated and precipitated under the action of the current, the salts are decomposed and the soluble bases are separated.

Under this treatment the juice becomes clear, limpid and colorless, and besides the sugar there is found only traces of lime, magnesia, and, depending on the anode used, a small amount of the salts of lead or of aluminum. The sugar remains intact in the positive liquid.

In addition to the advantages which this process presents, from the industrial manufacturing standpoint of sugar, we can henceforth investigate, identify and adulterate the differ-

ent sugars with a large number of vegetable substances.

With the current mentioned above it is understood that it takes about an hour and a half to treat a solution containing about 15 per cent. of sugar.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE New York Electrical Society will hold its 211th meeting on the evening of January 30 at the Edison Station of the New York Gas & Electric Light, Heat & Power Company, corner of Elm and Duane streets. Dr. Louis Bell, who is chairman of the National Electric Light Association Committee on Incandescent Lamp Standards, will deliver a lecture on "Electric Illumination at the Beginning of the Twentieth Century." Through the abundant facilities afforded by the Station, Dr. Bell will illustrate his remarks by frequent demonstrations.

A PLAN for the electric illumination of the Postoffice Department at Washington, D. C., on March 4, the night of the inauguration, has been prepared by Chief Electrician Lloyd of the building, which he believes, will surpass any feature of the proposed illumination.

THE towpath of the Miami and Erie Canal is being laid with steel rails and the trolley wires have been strung for quite a distance. It is expected to have the system in operation between Cincinnati and Dayton, O., a distance of 68 miles, within the next year. The work was begun last June, and according to the contract it must be in operation in its entirety within six years. The motors are to be 200 horse power, and instead of drawing one boat will draw several. The motors will not be for speed, the average being four miles an hour.

THE Niagara Falls Power Company is now constructing a second transmission line between Niagara Falls and Buffalo, N. Y., and this new line will be completed within a month at the latest. The cables that are being strung on it are made of aluminum. There are three aluminum cables being placed in position, and these form one three-phase transmission system. In each of the aluminum cables there are 37 wires or strands, which give the aluminum cables a much greater diameter than the copper cables of the old transmission line. Both the copper and the aluminum cables are bare.

THE figures submitted to City Electrician Ellicott of Chicago by Electric Inspector Hornsby show an increase in the use of electricity as motive power. Previous to and including 1892 1,172 motors, having a capacity of 3,496 horse power, were installed. In 1899 2,196 motors, with 8,688 horse power, and during 1900 2,464 motors, with 18,715 horse power, were installed. The total number of incandescent lamps installed up to 1900 in Chicago was 1,320,857.

REPRESENTATIVES of twelve automobile clubs met recently in the office of President A. R. Shattuck, of the Automobile Club of America, at 11 Broadway, New York City, to discuss means for placing substantial signposts upon the leading highways. President Shattuck represented the Automobile Club of

America, and the other clubs with delegates in the conference were the Automobile Clubs of Baltimore, North Jersey, Philadelphia, Long Island, Westchester, Rhode Island, Bridgeport, Massachusetts, Brooklyn, Pennsylvania and New Jersey. It was decided to begin by making the route from New York to Boston, going by way of Bridgeport, New Haven, Springfield and Worcester, and from Boston to Providence, Providence to Newport. In addition it was proposed to place signs on the road from New Haven to Providence, the road from New Haven to Philadelphia, which will probably be by way of Princeton and Trenton. Other routes will be from New York to Albany and from New York to the principal points on Long Island. Later in the summer it is hoped to extend these signposts from Buffalo to Albany and thence on to Worcester so that it will be possible, with the aid of these posts, to travel quickly from Niagara Falls to Boston.

It has been suggested in Chicago that a crusade against gongs be inaugurated, and a firm operating several automobiles there has supplanted its gongs by more mellow chimes.

THE Eatonton electric cotton mill located at Eatonton, Ga., is now running on full time and turning out cloth to its full capacity. It has in operation one hundred looms, which are kept running only during the day, while the spinning is going on night and day. It produces an average of 30,000 yards of sheeting a week. From seventy-five to a hundred hands are constantly employed.

IN the midst of a Channel snowstorm, as the Belgian steamer *Clémentine* crossed from Ostend to Dover on January 7, a final official trial of the Marconi system of wireless telegraphy took place, with complete success. A dozen Belgian Government officials were on board to witness the trial before recommending the system for adoption on all the Belgian Channel packet boats. They were quite satisfied with the day's achievements. Messages were regularly exchanged between the *Clémentine* and Ostend until the boat drew alongside Dover pier. The result will be the installation of the system on the Belgian boats. It is said the British authorities have prohibited the use of the Marconi system on English boats. Mr. Marconi now contemplates establishing stations all round the English coast, to enable vessels at any distance up to sixty miles from land to communicate with the shore.

THE Branden (Man.) Electric Company is establishing a long-distance transmission system and is erecting a plant at a water power 10 miles distant from the town. The equipment consists of a 500-hp. generator and a 500-hp. synchronous motor with 500-hp. in step-down and step-up transformers. The transmission will be carried out on the three-phase system at 10,000 volts.

A DISPATCH from Los Angeles, Cal., to the St. Louis "Globe-Democrat" states that a device for the utilization of the sun's heat in creating power has just been put into operation at South Pasadena. The device comprises a funnel-shaped reflector 334 feet in diameter at the top and 15 feet at the bottom, and containing on its surface 1,788 mirrors. This reflector is set on two fixed supports in such manner that it may follow the movement of the sun,

and is kept in focus by clockwork. The adjustment of the mirrors is such that the sun's rays are concentrated on a boiler, tubular in form, 13½ feet in length, with a capacity of 100 gallons of water and eight feet additional for steam space. The concentration of heat is capable of raising the temperature to several thousand degrees, but the boiler is prevented from being superheated by the water within it, which is brought to 350 or 400 degrees. The engine is fed and the supply of water in the boiler is maintained automatically and the only attention necessary to operate the machine is to adjust the mirror to focus and set in operation in the morning. This motor is pumping from a large underground tank at the rate of 1,400 gallons a minute.

SEVERAL automobile owners in Troy, N. Y., are making arrangements to form a club. Runs have already been made to Saratoga, Schenectady and other localities, and the automobilists have secured a storage headquarters where electric vehicles can be recharged.

It has been noticed in certain parts of America and in India, says the "Trade Journal's Review," that during thunderstorms incandescent lamps that are alight suddenly brighten up very considerably, in some cases sufficiently to break the filament; and in some instances the brightening is followed by the lamps giving an inferior light to that which it gave previously to the storm. It has been suggested that this phenomenon is due to a similar action to that which takes place in the coherer, which is used in the high tension form of wireless telegraphy, viz., a closing up of the molecules, and a corresponding decrease of the electrical resistance of the filament, this having been observed in coherers, when thunderstorms have passed over the places where they were fixed. It appears more likely, however, that it is due to pressures induced by the passage of charged clouds over the lines connected to the lamps, the increased brightening taking place when the induced pressures were in accord with the service pressures.

FROM Berlin comes the report that Emperor William recently ordered Privy Councilor Rathenau, the Potsdam Director of the Allgemeine Elektrizitäts-Gesellschaft, to report upon plans for introducing electric traction on Germany's trunk lines, a matter in which the Kaiser is deeply interested. Herr Rathenau informed the Emperor that the first experiments would be made next summer on the military road from Berlin to Zessen, a distance of thirty kilometers. Machines are now being built which are expected to speed from 200 to 250 kilometers, (132 to 155 miles). The plan contemplates connecting the largest German cities electrically with a system of single cars, carrying sixty persons each, running every ten or fifteen minutes, and capable of covering two hundred and fifty kilometers. Emperor William expressed his astonishment at the figures and estimates placed before him, and promised to render all the assistance in his power to what he called a "great national undertaking."

MR. CORNU, a well-known French scientist, has recently been carrying out some extensive experiments on the effects of the earth's magnetic field on the rate of chronometers. His conclusions, which one could have predicted

from first principles, says the London "Electrical Engineer," are that the earth's field has a distinct influence on the time-keeping of chronometers. The influence, however, is not a fixed one, but depends upon the magnetic movement of the balance wheel, and of the hair-spring. The obvious conclusion is that in order that chronometers may be quite free from interference from either variations in the earth's field, or from artificial magnetic fields produced by electric light wires, etc., they should be constructed on the non-magnetic principle.

EASTERN CANADIAN capital has purchased outright the Greenwood Electric Company and the Greenwood & Phoenix Tramway Company and \$75,000 has been divided by shareholders in the two concerns. The tramway company owns a valuable charter obtained from the Provincial Government about two years since, giving the undertaking the right to build an electric tramway from Greenwood to Wellington, Phoenix, Summit and Deadwood camps, with a line down Boundary Creek, passing the Standard pyritesmelter, to Midway, on the international boundary line. Surveys have been made of that portion of the line between Greenwood and Phoenix, and the entire scheme is a feasible one. The road, when built, threatens to become a serious competitor to the Canadian Pacific Railway on ore tonnage, which has at the cost of many millions of dollars already completed the construction of spurs to the camps mentioned. The electric tramway, when built and equipped, will represent an expenditure of not less than \$1,000,000.

MANAGER HOWARD SCRIBNER, of the Fifth Avenue Stage Coach Line in this city, has completed arrangements for the transfer of the automobile stages of the New Haven Stage Line to the Fifth Avenue Line. A deal by which the New Haven automobiles come into the possession of the Fifth Avenue Line was closed January 21 in New Haven by him.

IF the present plans are carried out the spring and summer of this year will witness a remarkable change in the industrial development of Northern New York. Electricity will be the cause of the change and the Massena Power Company with practically unlimited supply will furnish it. Electricity for lighting and for furnishing power will be supplied, it is claimed, at a low cost to every city, village and hamlet in Northern New York from Watertown to Plattsburg, and perhaps even greater distances.

THE United States Weather Bureau began the first systematic attempts in 1898 to ascertain the amount of damage done by lightning in the United States. The statistics collected for 1899 have just been published in the "Monthly Weather Review." A thorough system for obtaining this information has not yet been perfected, but though the statistics are only approximate it is believed they include most of the cases where important damage was done. The number of buildings damaged or destroyed by lightning in 1899 was 5,527; in addition to these 729 buildings caught fire as a result of proximity to other structures that were fired by lightning. The approximate loss in 2,825 cases was \$3,016,000. In 3,431 cases the amount of loss was not reported, owing, undoubtedly, in a majority of instances to the

fact that it was very small. The report says that a conservative estimate of the total loss by lightning during the year would be \$6,000,000. It is noteworthy that the great majority of buildings struck by lightning were not provided with lightning-rods. This was also the case in 1898. On the other hand seventy buildings provided with rods were struck and damaged in 1899.

RAILROAD operating officials are a unit in the opinion that the electric headlight which a number of railroads are now adopting to take the place of the old-fashioned warning light is one of the most important improvements in recent years.

PROFESSORS A. H. THILSEN and C. E. Hesse from Washington are assisting Prof. R. A. Fessenden in conducting wireless telegraphy tests between the life-saving stations along the coast of Virginia and North Carolina. The party recently went to Hatteras where they will erect their first tower. Others will be erected at Cape Henry, Va., and Roanoke Island, N. C. The first object is to use the wireless telegraphy along the coast when the telegraph wires between the various life-saving stations and to the Norfolk signal office become damaged by storms or otherwise. It is the purpose of the Government to give the wireless telegraphy experiment a thorough test on the coast during the present winter. Prof. Fessenden will have entire charge of the work.

THE New York Gas & Electric Light, Heat & Power Company is making an interesting experiment in tunnel building which, if successfully accomplished, will practically revolutionize the usual system of construction. At its immense power plant at 39th street and the East River it proposes to build a tunnel under the East River, through which all the water required for condensing purposes at the plant will be obtained. This circular tunnel, 225 feet in height and 12½ feet in diameter, is now being built at the yard of Lewis Nixon, the ship-building firm, thirty-eight miles away from the power plant. When the length is completed the whole tunnel will be towed up the Bay and the immense structure will be sunk in the place required. The final details, which will be completed by divers, will consist merely of riveting the tunnel with the shore approaches.

OBITUARY.

Elisha Gray.

Prof. Elisha Gray died suddenly in Newtonville, Mass., early in the morning of January 21. Death was due to heart trouble.

Prof. Gray began life as a blacksmith in Ohio in 1850 at the age of fourteen. He later took up carpentering and became a boat builder. While earning his living he found time to take a full course at Oberlin College where he became especially interested in scientific subjects. Prof. Gray and Dr. Graham Bell invented the telephone almost simultaneously, although the latter filed his application for a patent about an hour before Prof. Gray.

Prof. Gray for many years gave his whole attention to bringing out and perfecting electrical devices, and to his untiring efforts and wonderful mind is due the typewriting telegraph, the telegraphic repeater, the telautograph, and still more recently, a system of submarine telephony. The death of this famous inventor is a serious blow to the electrical fraternity and industry.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 11.

MOTORS.

We might head this article transmission of power by electrical currents, or transformation of energy, and either one would be just as appropriate as the one selected.

By the use of a dynamo we transform the energy of the steam or water power to electrical energy and by the use of a motor we transform electrical energy to mechanical energy. Anything that has the power of doing work contains energy, that is, energy is the power of doing work. Now let us see the transformation of energy that goes on through the medium of a steam engine, a dynamo and a motor. In the first place, the energy in the coal is applied by combustion to producing the energy of steam under pressure and that is transformed to mechanical energy by the steam operating a steam engine. Again, by applying this mechanical energy of the steam engine to revolving the armature of a dynamo, electrical energy is produced which, when applied to an electric motor, is again transformed to mechanical energy. In each case the power of doing work is exhausted in producing another power of doing work. The problem of the greatest interest to the engineers of to-day is not how to accomplish each of these transformations, but how to do them with the greatest amount of efficiency.

We have seen that the operation of a dynamo is that an electric pressure is generated in a conductor when it is put in motion within the influence of a magnetic field. Electric motors operate on the principle that a conductor carrying a current has a tendency to move when placed within the influence of a magnetic field, on account of the mutual action of the lines of force of the current and of the field. These two laws are practically the reverse of each other, and therefore the action of dynamos and motors is a reversible one. A machine which is designed to be used as a dynamo to generate electrical action when driven by mechanical power may usually be used equally as well to generate mechanical power when driven as a motor by means of applying electric currents to it. The best dynamos very often make the best motors, because the same laws apply in either case and they operate under the same governing influences.

The essential features of a good dynamo or motor for general use are small magnetic reluctance in the magnetic circuit, good quality of iron, both in the field and in the armature core, armature core well laminated, as little waste as possible of power by heating, and good insulation of the windings from electrical contact with the iron cores or with the other turns of itself.

When the armature of a dynamo is revolved in a magnetic field so as to produce electrical action the lines of force belonging to the induced currents are attracted by the lines of force of the field and the force exerted is in a

direction which tends to stop the motion of the armature so that force has to be exerted to keep it revolving. Suppose in this machine that electric current is fed to the armature, then the same conditions regarding the force exerted would exist, and the armature would be put in motion by that force.

You will see it clearly by referring to Fig. 1. If the current be fed to the armature windings through the medium of the brushes and is flowing as indicated by the arrows, then lines of force will be produced which will be acted upon by the lines of the field and the armature will be caused to revolve. By reversing the direction of the current flowing through the armature, the lines of force or magnetism produced by it will be reversed, and then the direction of its rotation will be reversed. Another way to reverse the direction that the armature of a motor revolves is to reverse the current flowing through the field coils, which in turn reverses the lines of force or magnetism of the field and would have the same effect. Then to reverse the direction of a motor's motion it can be done by reversing the current feeding the armature or by reversing the current feeding the fields, never by reversing both.

FIG. 1.

Referring again to Fig. 1, you will observe that if the armature be revolved in the direction it would move if operating as a motor, the operation would be the same as a dynamo, and induced currents would be set up in the coils of the armature and in a direction opposite to that flowing now indicated by the arrows. Why does this action not go on when the machine is working as a motor? It does, and the electric pressure which is thus set up in the armature conductors is in a direction opposite to the external source, and is called counter electric pressure or counter electro-motive force. It is proportional to the work which is done by the motor, and a useful electrical motor to-day which would operate without producing a counter electro-motive force is impossible of existence and must remain so unless the natural laws of electrical action and phenomena entirely change.

We will now take up the general instructions to be considered and followed in setting up and operating electric motors.

Machines should be placed in as dry a location as possible, and the cooler the location is the better. In considering the operation of belting, the position of the machine and the direction of rotation should be such that the strain of belt should come on the bottom and as nearly horizontal as practicable. This gives a more efficient transmission, with longer life to both belt and bearing, due to decreased strain on the belt. With a horizontal belt, the distance between centers of the pulleys should not be less than four times the diameter of the largest pulley on which it runs.

With vertical belts, or those nearly so, the distance should be at least six times the diam-

eter. To insure the best and quietest transmission the belt should be made endless, by cementing the ends together. Have belt only tight enough to avoid slipping, as too great a strain on the belt will produce unnecessary friction.

In constructing a foundation on which to place a machine it is very desirable to have it of brick or stone with cement; however this is not necessary in machines of small sizes, although the best in any case.

In assembling a machine care should be taken that all connections be clean and bright, and before fastening the bearing seats of the armature it should be observed that the surface of the armature is the same distance from the pole pieces at every part of its surface. A machine should always be set perfectly level, and always do this by placing a spirit level on the armature shaft; it is not advisable to level up a machine in any other way, because the framework may not be uniform in its distances from the shaft. Be sure that the brush holders are put on in the proper way, that is, in the direction in which the machine is to rotate.

Carbon brushes are generally used on motors, and before placing them in position it is a very good idea to boil them in paraffin for a few minutes or until no air bubbles rise to the surface of the wax. After they are cold scrape all the wax off the surface of the brushes so that they will make good electrical contact with the holders.

To set the brushes so that the point of contact will conform with the curve of the commutator, place them in the holders with a piece of sand paper, rough surface up, between them and the commutator; then by drawing the sand paper back and forth around the surface of the commutator, the contact face of the brush will be made to fit perfectly true to the surface of the commutator; when the sand paper is removed, clean brushes, brush holders and commutator thoroughly from carbon dust and dirt that may have collected on them, then adjust sufficient tension on the brushes to insure good contact, which should be not too great, however, or it will cause heating of the commutator.

Before starting be sure that oil is placed in the bearings and that the rings for circulating it work perfectly free. During the first week of running the machine the bearings should be carefully watched, and the oil removed every three or four days, replacing with clean oil, until the oil draws off clear from the bearings. and then oil may be left from two to three weeks without removing.

When a motor is started and the load is being thrown on watch the brushes to see if any sparking occurs. If they spark at full load and do not spark at no load, then move the position of the brushes back slightly, or opposite to the direction in which the armature is revolving. Set the brushes in the best position for non-sparking for the average load. This operation is the reverse in a dynamo, for if a dynamo sparks at full load and does not on no load the position of the brushes should be moved ahead, or in the direction that the armature is revolving.

To reverse the direction of a motor, reverse the connections on the brushes and set the brushes in an opposite direction.

In case the brushes chatter and appear not to run smoothly, rub a very little oil or vaseline on a canvas cloth, and wipe the commutator over with this cloth several times daily

and continue until the commutator becomes "glossy."

Fig. 2 will give an idea of the way to connect a switch and starting box for a motor circuit: however most every manufacturing company has apparatus especially designed for use in this capacity equipped with automatic rheostats and switches, and the sketch below is only given in case no special apparatus is to be used other than a switch and ordinary re-

FIG. 2.

sistance box. Before starting always have all the resistance cut in the armature circuit and then turn the lever slowly, giving the motor time to reach speed as the resistance is being cut out.

Article No. 12 will be entitled "A Talk To Wiremen."

THE USE OF SEARCHLIGHTS IN NAVAL WARFARE.

Recent manœuvres in the Mediterranean, says a writer in the "Electrical Review," London, have shown searchlights to be a very effective means of defence when properly used, but the position from which they are used requires very careful consideration.

As regards the direct use of the light in revealing an approaching enemy, there is much to be said on both sides. In the case of a fleet steaming in company on a dark night, and attacked by torpedo boats, the only means of defence is obviously to turn all searchlights on, and endeavor to repel the attack by a sharp gun fire, unless there is any chance of eluding them under cover of the darkness.

Experiment has proved that in the case of a night attack by torpedo craft, the advantage lies very much on the side of the small craft, who can easily make out the dark silhouette of the upperworks of their huge adversaries, while they themselves are practically invisible. By turning on the searchlights, therefore, the chances are more equalized, for although the act reveals to the attacking boats the position of each ship, it at the same time gives a target for the guns.

Now the results of night firing at a target lit up by the searchlight are deplorably weak, and when this target happens to be a torpedo boat going at full speed, one is forced to admit that the chances of destroying her before she can discharge her torpedo are not great; still there is no alternative, and I think it is generally considered to be a bad case for the fleet attacked, for it must be remembered that, although several boats may be put out of action, if only one can get her torpedo in, the attack is successful. No one who has not tried to pick up a torpedo boat with a searchlight, or having picked her up, to keep the light on her, can have any idea what a difficult matter it is.

Of course, torpedo nets add very considerably to the strength of the defence, but they are not infallible.

The circumstance under which a torpedo attack is most to be feared, however, is that in which a ship, temporarily disabled, is lying

at anchor in port, awaiting repairs. I propose to give a brief sketch of the conditions under which experiments in this direction have been tried and the means of defence adopted.

A suitable port for the purpose having been chosen, the ship was anchored, her nets gotten out and placed, and all possible preparations made for the reception of an attacking flotilla, which had orders to deliver an attack on a certain night. The boats were totally unaware of what preparations would be made or what would be the position of the ship in the harbor.

The defence was prepared as follows: Searchlights were placed one on either side of the narrow entrance and guns were landed to form a small battery on either side, the searchlights were trained upon a buoy placed in the center of the channel, so that any boats entering the harbor were bound to pass through one or other of the two beams. All lights were extinguished in the ship, and patrol boats were sent out to give warning, by means of colored lights, of any approach, the color and nature of the light indicating the direction from which the attack was coming; another searchlight was placed in a boat moored off to the right front of the ship, throwing a diverging beam which would, by throwing a dazzling light in the eyes of the attacking party, screen the ship from view.

The night was ideal, heavy rain squalls and thick clouds combined to make the darkness intense, and beyond the two beams at the entrance of the harbor there was nothing to give the slightest clue to the attacking force.

About three hours after darkness had set in, a light from one of the patrol boats indicated an attack from the north, and soon after, a boat was seen to pass at full speed through the beam to the right of the harbor mouth, closely followed by a second. The screening light moored off the ship was now turned on, and a heavy fire directed at the first boat as she advanced, the light at the entrance endeavoring to pick up the second. At this instant two more boats passed through the beam to the left, one of which was picked up by the light in the upper top of the attacked ship, this light being turned on and the flash of the guns revealed her position at once to the attacking party, but not before the first boat, completely dazzled by the screening light, had run upon the rocks and put herself out of action. The remaining four boats fired their torpedoes, one of which missed altogether, while the other three went into the nets, two so close together that the first would have cleared a way for the second in reality by its explosion, but it was claimed that one of their boats had been under fire long enough to disqualify her in the opinion of the umpires, and so the attack was judged to have been in this instance unsuccessful according to the rules.

However, the fact still remains that in spite of the various searchlights, two boats had entered and discharged their torpedoes almost unobserved; it is a fact that is difficult to realize when we remember that they actually had to pass through the beam at the entrance before they could get in at all.

A comparison of the experiences of both parties shows the enormous importance of the position of searchlights. These on the water line completely destroyed the vision of the occupants of the boats while in the ray, though being of little value to the gunners, who could not distinguish any definite target through

the intense white light, whereas the highly-placed light from the fighting top, although making a better target for the gunners to direct their fire, also gave a good indication to the torpedo boats of the ship's position, so that, firing their torpedoes at a spot immediately below it, they were able to make pretty certain of getting their torpedoes home, while to those on whom the rays were not shining, the upper light and the flash of the guns were an excellent guide to enable them to determine how the ship lay, and direct their attack accordingly.

Colored glass shades were used by those in the boats with advantage. By their means the dazzling effect of the higher projectors could be very much reduced, but it was a different matter with the low ones, which cast an impenetrable glare that can only be compared to a dense fog, through which nothing was visible but the position of the projector itself and the flashes of the guns. When these flashes proceed from a shore battery, and the projector is removed from the ship, the effect is entirely misleading, and the boat taking the gunfire to be proceeding from the ship is led to discharge her torpedo at the shore or else, in attempting to get closer, dashes herself upon the rocks, as was the case with one of the boats in this instance; but, on the other hand, the gunners found it almost impossible to distinguish any object when attempting to fire from above the beam, though the boats showed up clearly enough when they were firing underneath it, as was the case with the light from the upper top.

The problem resolves itself into the question of whether it is worth while using the top light for the benefit of the gunners, and thereby revealing the ship's position more clearly to the boats, or whether it is better to trust entirely to the screening effect of the low light, in which case the ship's guns must remain silent and trust to the shore battery to do the work, bearing in mind that the shore battery is still under the very great disadvantage of firing through the screening light. It is, perhaps, difficult for those who have not experienced the conditions, to realize the effect of viewing an object through the beam of a searchlight.

A boat steaming through the light is only seen by the reflection upon her mast funnels, etc., and she therefore shows up as a white object against a somewhat paler background, the contrast is only made by the increased light in the beam due to reflection from the boat.

When the observer is so near to the projector that his line of vision enters the beam some distance ahead of the advancing boat, his eye receives the reflection of dust particles in a more concentrated part of the beam, and the light from them is proportionately greater, reducing the contrast very considerably, so that the boat becomes almost invisible. Hence we see that the searchlight itself should be as far removed from the gunners as possible before good gun practice can be expected.

The city council of Amsterdam has voted the sum of 6,000,000 guilders, or \$2,412,000, for an electric plant which is to furnish power for street cars, lighting, etc., for that city. A part of the supplies should come from the United States, says the United States Consul, and the sum voted is large enough to promote zeal in attempting to secure the work.

THE RATE QUESTION.*

BY HENRY L. DOHERTY.

At the last meeting of the National Electric Light Association, I read a paper entitled "Equitable, Uniform and Competitive Rates." I proposed a rather radical departure from our present methods, which seemed to me a logical solution of many of the difficulties which now confront us. Before adopting a rate system differing radically from all methods with which I was acquainted, I wished to obtain an expression of opinion from representative central station men which I thought would prove my plan either meritorious or otherwise. The discussion this paper provoked was not general, and no valuable points were developed. The sentiment at the meeting was unfavorable to the plan I outlined. The paper received but little comment from the electrical press, and was read in full only by those who chanced to obtain an advance copy published for the meeting. Since the Chicago Convention to the present date I have been kept busy answering correspondence regarding this rate system, and few of my correspondents seem to have gained from my paper a clear understanding of my views. The plan I then outlined seems to have grown greatly in favor, and many of its early and most pronounced opponents now express themselves as believing that it offers the best solution yet proposed towards the establishment of equitable and uniform rates.

After reading my former paper, I found it a hardship to answer all of the correspondence received, owing to the fact that many inquiries were made without having carefully read and considered my paper. To have answered some of them fully would have necessitated a repetition of much that had already appeared in printed form. I can not attempt another exhaustive treatise on this subject, but if any one is sufficiently interested in this matter to carefully read this paper, and also my former paper, which will be found in the published proceedings of the last Convention of the National Electric Light Association, I will not only willingly answer any inquiries they care to make, but will welcome any discussion of the subject by correspondence.

There are really but two distinct methods of charging for electric service, viz: First, flat rates. Second, meter rates.

An analysis of flat rates would mean, a definite charge for a fixed capacity, regardless of quantity of current used, within a limit of no use to constant use. This would work out to a minimum kilowatt rate, for current of the fixed rate, divided by the maximum consumption, to a maximum kilowatt rate, to infinity, if no current were used.

An analysis of meter rates would mean a fixed charge per unit of current sold, regardless of capacity demanded. In this case the station's cost to produce would vary from the very low cost per kilowatt hour, if total capacity were used continuously, to infinity, if no current were used. In the abstract, flat rates are preferable, as they give the station the advantage of the infinity end of the variation, but both systems seem to me almost absurd.

Theoretically, flat rates can be placed sufficiently high to absolutely protect the station from loss, but such rates would drive away much profitable business.

Meter rates cannot be placed so high but that loss may result. Even if a consumer agree to pay \$1 a kilowatt his consumption may be so small that his total payment will not equal the cost of reading his meter, keeping books for his account, core loss of transformer capacity and shunt loss of meter.

It is probably unnecessary to comment on the inequity of flat rates, but rates based solely on consumption, without considering the maximum demand that the station must be prepared to supply, are often even more inequitable. An analysis of the accounts of one central station, with which I am familiar, will illustrate the relative worth of different consumers supplied on a meter basis. A minimum bill of \$1 per month is now charged if no current is used. This means a minimum of \$1 per lamp per month, if the consumer has but one lamp, and .001 per lamp per month if the consumer has 1,000 lamps. At this particular station—

The average yearly bill is \$1.96 per lamp.

The minimum " " " .24 " "

The maximum " " " 38.46 " "

Assuming that the station represents an investment of \$20 per lamp wired up, this means that for these different classes of consumers, were all the consumers of one particular class, the lengths of time for our gross revenues to equal our investment—

For the average consumer 10 years and 3 months.

For the minimum consumer 83 years and 4 months.

For the maximum consumer no years and 6 months.

If the entire amount paid by the minimum consumer were clear profit, you would be earning but 1.4 per cent. on your investment. The consumer using the least current, may add just as much to your absolute maximum demand as any other consumers you have. I once cited the case of a church, which is generously equipped with lights, but which for several years past has used light but one night each year, and that night is Christmas Eve, or the preceding night.

Charging a fixed rate per kilowatt hour on a meter basis bears no relation to cost of service. Cases may sometimes be best illustrated by exaggerations. Suppose you should receive an application for a 2,000 light connection to be used as a relay in case of a breakdown of an isolated plant. At what rate per kilowatt could you afford to supply the applicant with current? This is the same problem which confronts us on a modified scale with each consumer.

Our costs are fixed by—

1. The number of consumers we have.
2. Distance from the station.
3. Capacity they demand.
4. Amount of their consumption.

Distance from the station is influenced by where we locate our station, and I see no reason why we should vary the cost to different consumers because of varying distance from the station, except in extreme cases. For lack of time I will drop this item of cost from further consideration and go on to the others.

There are certain costs, such as bill making and meter reading, which are entirely fixed by the number of consumers or meters, and many of our other costs are virtually fixed by the number of consumers or meters we must care for, such as meter testing and maintenance, rent, complaints and gratuitous work, superintendence and inspection. To cover such expenses as these I propose to have a fixed charge for each

consumer, regardless of his consumption or the size of his installation, provided no more than one meter is installed.

There are certain other costs which are fixed by the capacity demanded, such as interest on investment, transformer losses, maintenance, depreciation, etc. To cover such expenses as these I propose to have a fixed charge for each lamp the consumer's connection will permit him to demand, without regard to the number of lamps installed or amount of current used.

There are other charges which are fixed by the quantity of current generated, such as boiler fuel, lamp renewals, etc. To cover such expenses as these, I propose to charge a fixed and uniform rate per kilowatt hour consumed.

A moment's consideration will, I think, convince all of you that outside of boiler fuel and lamp renewals your operating costs would not be greatly increased if you operated 24 hours per day at your maximum load, nor would they be greatly diminished if you operated but 5 minutes per day at your maximum load, assuming, of course, that you stood ready to serve current at any time throughout the 24 hours should it be called for.

A charge for "readiness to serve" fixed on this basis, and a low kilowatt hour rate, will bring about many advantages to the central stations and protect them from loss, unprofitable patronage, and, I believe, will also protect them from undesirable legislation.

I recognize the fact that any change in methods of charging will cause trouble, if enforced suddenly on those consumers whose bills it will increase, but this system can be used in place of horizontal reductions in the rate now charged, and can reasonably be exacted from new consumers, and eventually made universal. Evolution—not revolution—must be the policy of all quasi-public corporations. In view of the fact that it will be inadvisable to enforce this system on old consumers who will be injured by its adoption, I propose to adopt it first as a substitute for all special rate consumers, and also for new consumers. Instead of dividing my expenses as they exist to-day and apportioning them amongst the consumers on this basis, I expect to adopt such charges as will benefit long hour, and therefore profitable, consumers to such an extent as can be readily compensated for by the additional business which can be secured with a lower rate per kilowatt hour. I will continue the rate cutting by small steps so long as I can protect the company's net earnings from marked shrinkage.

In one station where we have been experimenting we are convinced that it is profitable to supply consumers on this rate system, making a fixed charge of \$6 per consumer per year, plus \$1.80 per lamp demanded per year, to which is added 4 cents per kilowatt hour for current used, than to sell at a straight rate at 10 cents per kilowatt hour. It is needless to call attention to the fact that consumers will be much more liberal in the use of current when supplied at 4 cents than at 10 cents per kilowatt hour. My plan is to make all contracts for a year or more, allowing the consumer to contract for any capacity he may choose, the capacity to be increased whenever he desires, but not to be decreased except at the expiration of the period contracted for; the capacity to be limited by a suitable maximum demand cut out to prevent him from demanding more capacity than he contracts and pays

*Paper read before the Northwestern Electrical Association Convention, held at Milwaukee, Wis., Jan. 16-18, 1901.

for, and one-twelfth of the fixed charge to be included in each monthly bill.

This system, I believe, can be rendered absolutely uniform, both for light and power, and will prove more equitable than any other system.

A reduction of the kilowatt rate should be made for current supplied for power purposes to compensate for higher costs of lighting service, owing to the exact degree of regulation necessary and the cost of lamp renewals, which is a more important item than is generally believed.

I have no patents or copyrights on this system or the appliances its use demands. Anybody can use it as described or as they care to modify it.

The system is already in use in one central station with which I am connected and we are about to put it in use in two others. It has also been partially adopted by other central stations with which I have no connection and for which I have no authority to speak.

CENTRAL STATION SWITCHBOARD CONNECTIONS.*

BY J. A. SEAGER, A.I.E.E.

Among the minor points in central-station design is the arrangement of the cable connections to the switchboard from dynamos, battery and mains. Although many other considerations claim precedence, it is essential that these leads should be well arranged, as economy both in first cost and in running expenses can be obtained, and, what is more important, mistakes of electricians and wiremen due to complexity of connections must be avoided. Without going much into detail, the following elementary points may be noted. Two different considerations govern the arrangement of high and of low-tension connections. In the first, high insulation at every point is the chief aim of the designer. In the second, dealing with heavy currents, minimum copper resistance and good contact are the important objects. In high tension work stranded cable is almost invariably used, and in the majority of cases the cable is concentric. The insulating material should preferably not be rubber, as this deteriorates rapidly under such heat conditions as are found in cable trenches in stations. If used, the cable should be vulcanized. Whether the cable be lead sheathed or not depends on whether it is drawn into iron or pot tubes or clefted in a dry trench, or else laid in a trench imperfectly protected from moisture either from drains or escaping steam. The greatest care must be taken to prevent abrasion of the insulating material. Probably the best method for this purpose is to use a glazed stoneware tube, the cable being drawn into this. Next to this comes the employment of iron pipes. It should be remembered that there is a tendency for water to condense in the inside of these tubes and for grit to get in if they are left open, so that the ends should be closed with tarred wood plugs shaped to enclose the cable. The ends of the tube should be cupped outwards to prevent the edge of the tube cutting the insulation when the cable is bent about. If iron pipe is used for alternating current work, concentric leads are necessary, in order that the eddy currents generated by the "go" current may be eliminated by those of the "return." Iron pipe (which must, of

course, be "barfied" or else coated with tar) is cheaper than stone-ware. An alternative to iron or stoneware tube is, as mentioned above, a concrete trench. This is generally run along the dynamo ends of the foundations for the plant, and leads to the back of the switchboard or to a cable-room beneath the switch gallery. It is made of sufficient capacity to contain all necessary cables placed well apart from one another, say 5 in. from center to center with additional room for future extensions. In small stations cast-iron chequer plates fitting into wrought-iron seats are placed over the trenches. Care should be taken to see that these are watertight, as cleaners have a tendency to slop water very freely about the floors. In larger stations it is found to be better practice to make the trenches large enough for a man to pass through easily without touching wires, and to cover the top of the trench with a brick-work or concrete arch leveled to the floor at the top. It is useful to construct the trench at the same time as the foundations, building into the latter wrought-iron pipes having a gentle curvature leading from the top of the foundations to the trench, suitable for drawing in wire. Inside diameter of pipe to be not less than twice external diameter of cable; least radius of curvature of bend 3 feet. Before and after erection a mandrel of hard-wood $\frac{1}{4}$ inch less diameter than the internal diameter of the pipe, and, say, 3 inches long, should be drawn through the pipe to make sure that there are no burrs, fins, or other obstructions. If such exist, they must be removed with a steel tube scraper.

Practice varies as to the arrangement of cables in the trench. If this is liable to wet, lead-covered cable should be used, supported at intervals of about 15 feet on iron brackets affixed to the wall of the trench. Alternatively, wrought-iron pipe may be run along the trench and ordinary insulated cable drawn in. The method of combining trench work and iron piping is rather expensive. If the trench can be guaranteed dry, ordinary insulated cable can be fixed to the walls of the trench by means of wooden or pot cleats. A trench which is likely to receive water should have its bottom sloped down to the center of the passage, where there should be a gutter with a continuous slope of, say, 1 inch in 10 yards, leading to the station sump or to the drains. If corners are necessary in the trench, these should be rounded off wherever possible, as a sharp bend strains the insulation of a cable injuriously. If it is impossible to remove a sharp corner, a slight amount of slack must be allowed in the cable at the corner. Mechanical joints are not always satisfactory in high-tension alternating work, as the slightest slackness causes a dangerous arc. Care should therefore be taken to lead the cables to perfectly accessible positions where the terminals are under easy observation, both on the board and machines. This should be observed in the particular case of concentric feeders. It is common practice to bring the station end of the feeder into the middle branch of a T joint-box, and there connect it to two separate cables leading to terminals on the board. It is essential that all connections in the joint-box should be sweated, and no disconnecting links should be allowed there.

These should be placed in full view either on or at the back of the board.

In continuous-current work, where the power is transmitted at a low voltage, the magnitude of the current involves a heavy outlay

in copper. To minimize this the runs should be as straight as possible, and the cables should be kept as much as one horizontal plane as convenient. It would be found cheaper; in the case of large outputs, to insert the main machine and feeder switches in the direct horizontal line between bus bars and cables, and to work these switches by mechanical levers and link work from the gallery above, rather than to mount the switches on the board, thereby incurring extra expense in vertical runs. For copper cables inside a station connecting machines, battery etc., to board, a current density of 800 amperes per square inch should be adopted; for screwed or coned contacts about 500 amperes per square inch may be allowed, while a density of 400 amperes only should be taken for planed and scraped surfaces bolted together. Leads from regulating cells in a battery-room are often made of solid copper bar. A usual plan is to bring these away vertically from the cell terminals to about 8 feet above floor level, thus allowing the attendant a clear gangway all round the cells. The bars are then bent horizontal and passed through holes in a horizontal wood beam running parallel to the line of cells, which is in its turn supported either from ground or ceiling. In this way the rods are held up and prevented from touching each other. Where possible, the rods are led to the wall immediately behind the switch gallery, and are connected either to back terminals on the regulating switch or to a terminal board built into the wall. This is to prevent any gaseous acid escaping into the switch-room. Anti-sulphuric enamel is used to cover both the rods and any wood or iron work in the battery room. Milking leads must, of course, be flexible, and are of ordinary cable. It is found that a grey flintose rubber covering is the best protection for these. Any copper terminals or brasswork in the battery-room, if not enameled, should be protected by cases having glass fronts and rubber ring joints to exclude the acid spray. Switch gear and instruments should be kept out of the battery-room, unless it is absolutely necessary to have them there.

The use of paint as an element of safety is occasionally overlooked by station engineers. In high-tension stations, all connections at a high voltage should be painted red. All at a lower voltage—i.e., secondary connections—can with advantage be painted blue. If one side of the high-tension system is earthed, the cables on that side should be black. In a low-tension two-wire station, the negative side should be black, while the positive should be painted red. In a three-wire station the outers are red, the middle being black.

It is not overstating the case to say that the major portion of the complexity of a station (as far as the electrical part is concerned) is due to a muddled arrangement of connections. It is not enough to have all connections symmetrically arranged at the opening of the station, although this is essential. Sufficient room must be left in the design to allow for extensions. If alterations to plant are decided upon, the scheme of cable connections should be remodeled till the arrangement is simple. A temporary connection should never be allowed, in consideration of weeks of meritorious service, to become permanent. A cable festooned from pillar to post, tied up with bits of rope, is a sight more common than comely. An engineer who does not keep his cable connections simple and up-to-date should insist on his wireman taking out an insurance policy.

*From the "Electrical Engineer," London.

NORTHWESTERN ELECTRICAL ASSOCIATION CONVENTION.

The Ninth Annual Convention of the Northwestern Electrical Association was held at the Hotel Pfister, Milwaukee, Wis., on January 16, 17 and 18.

FIRST DAY'S SESSION—WEDNESDAY, JAN. 16.

The Convention was called to order by the President, Pliny Norcross, at 12 o'clock noon.

The minutes of the previous meeting were adopted as printed.

An adjournment was then taken until 2:30 P.M.

At that hour the Convention was called to order by the President who delivered his address. Among other things, referring to municipal ownership, he said:

"The 'fad' of municipal ownership of electric plants may sweep over the country as other socialistic, communistic, impracticable schemes have done, but it will in the end be a ruinous experience, and I firmly believe that there is not now so strong a sentiment in its favor as there was a year ago.

"As the matter of municipal ownership is more fully understood the desire for it will diminish.

"One reason for its adoption by many towns is the fact that unpleasant relations have grown up between the local plant and the municipality.

"The citizens are usually impressed with the idea that the local company is making too much money out of the business, while the company is confronted with the fact that the original outlay was not always a judicious one, and in all cases was very expensive.

"I well remember the time when carbons, dynamos, lamps, etc., cost three times as much as they do now.

"In every case the original plant was too small, and people who first invested were glad enough to get out of it at any sacrifice. Most of the plants in operation to-day stand upon the ruins of one or two earlier plants.

"The competing gas companies at first were somewhat disturbed by the new illuminant, and cut prices in order to hold their plants in operation. New electrical inventions then, as well as now, have compelled the abandonment of the earlier equipment.

"Cities are besieged with applications for apparently better contracts, and too often forced the old companies, which had struggled bravely to hold up against the rising tide, into bankruptcy.

"The city often gave franchises to new companies, or still worse, practically confiscated the existing plant by putting in one of its own. In this way many pioneer plants proved to be unfortunate investments. Most of these unfortunate facts could have been prevented by a little mutual concession."

The President's address was received with applause, and a vote of thanks extended to him.

The Secretary-Treasurer's report was read and accepted by a unanimous vote.

A committee consisting of Mr. F. A. Copeland, of La Crosse; Mr. E. L. Debell, of Sheboygan, and Mr. S. B. Livermore of Winona, was appointed by the President to consider the suggestions in the Secretary's report.

Mr. E. L. Debell, chairman of the Legislative Committee, then presented his report, which was in part as follows:

"Since this report was prepared and within the last twenty four hours there has already been one bill presented to the Wisconsin Legislature having as its object the repeal of the present license fee or percentage tax. It is probable that other bills will be presented to the Legislature following the recommendations of the tax commissioners. The tax commissioners in a partial report made to the Legislature state that with their present knowledge of the condition of affairs they recommend the license fee to be continued for the present, evidently to see how it works for the next year or two, but that the rate be raised. They propose that all companies, including street railway companies and combined street railway and lighting companies, shall pay 3 per cent. instead of 2 per cent. as at present, where the gross receipts of the company do not exceed \$50,000, and where they do exceed \$50,000, that a tenth of one per cent. be added for each \$7,500 of additional income, so that the smallest raise that would affect any street railway or street railway lighting company in the State would be 50 per cent. over the amount paid by them this last year. And if their gross receipts exceed \$50,000, the raise would exceed 50 per cent. according to the amount of their gross receipts. For instance if the gross receipts amount to \$65,000, the proposed tax would be 3 2-10 per cent., or an increase of 60 per cent. over the present rate, and so on, for every \$10,000 additional receipts over \$50,000 there would be two mills added to the 3 per cent., which is recommended as the minimum tax.

"As stated in this report the Association was represented at a hearing given by the tax commission at Madison on the 4th of September, and we urged them to the best of our ability, to retain the present license fee at the present rate of 2 per cent. It seems, however, that the commission concluded that the electrical properties were not paying a fair portion of the taxes. Hence their recommendation to the Legislature. We have done all we could before the tax commission and the only thing that remains to be done now is to appear before any legislative committee to whom may be referred any possible bills relating to the taxation of electrical properties."

A motion was put and carried that the report be adopted and a vote of thanks extended to the committee.

Letters of regret at being unable to attend the Convention from Henry L. Doherty, H. W. Frund and others were read by the Secretary.

The president then appointed as a committee to examine applications for membership, Mr. F. A. Copeland of La Crosse, Mr. W. P. Bragg of Monroe and Mr. W. H. Thorp of Beaver Dam.

As nominating committee the President appointed Mr. T. F. Grover of Fond du Lac, Mr. P. H. Korst of Hartford, Wis., Mr. Edward Daniell of Menominee, Mich., Mr. J. H. Gille of St. Paul, Minn., and Mr. G. L. Thayer, of Toledo, Ia.

The question of a summer meeting was then taken up.

Mr. Debell—I do not know whether a committee will be actually necessary in this case, but I make a motion that a summer meeting be held and that it be held in Sheboygan. (Laughter.)

The Secretary—I move that the matter of a summer meeting be referred to a committee of three to be appointed by the President. My ob-

ject in that is that it will facilitate the business and allow that committee to hear others on the subject, and I think that the report might be brought in at a definite hour where all can be present and discuss it.

Motion carried.

The President—I will appoint as members of the committee on summer meeting Mr. E. L. Debell, Mr. W. W. Low and Mr. S. B. Livermore.

The paper by Mr. Henry L. Doherty, of New York, was then read by Mr. Debell, the subject being "The Rate Question."

The paper was followed by one entitled "Practical Line Construction" by Mr. Loren W. Burch of Madison, Wis.

The reading of these papers was followed by a discussion on the subject of the tax on lighting plants.

This was followed by some miscellaneous discussions, after which the meeting adjourned until the following day.

THURSDAY, JAN. 17.

The Convention was called to order by President Norcross at 12 o'clock noon.

A communication was read from the Jamestown Electric Light Company asking for information regarding a gasoline arc lamp.

The President—That is a complimentary letter to this Association. It is to our credit that a man in Ohio, where they generally do not have troubles, or where they attend to them themselves, is anxious to get information regarding this gasoline arc lamp from us. What shall we say to him?

Mr. Gille—I think probably they refer to street lighting lamps.

The President—Yes.

Mr. Gille—We have been up against that same proposition and I think a good many other cities have.

The President—Give us what information you can on the subject.

Mr. Gille—The only thing so far as we have gone that we know against it is this, that the city has contracted for 600 of them as an experiment. In the city of Chicago they say that they have in the neighborhood of 18,000 of them, and I think it is a matter that ought to have some attention, even if it is brought up in this way by a letter. It is going to be a serious question in street lighting—I refer to incandescent gasoline lighting. They use a Welsbach mantel.

Mr. J. M. Hill of New York—I think the writer of the letter refers to a lamp which I myself saw in Cleveland some time ago. It looks like an arc lamp and it is claimed to be of 3,000 candle-power. I do not think that the correspondent in the letter refers to the Welsbach lamp which Mr. Gille refers to as being in Chicago.

The President—Is it a new lamp?

Mr. Hill—I saw it a year ago, and somebody paid quite a large sum for the rights in Ohio. This lamp had, I should say, five burners. Mr. Higgins says he thinks he has one in his town, Marinette. It is a regular arc lamp, but has no globe on it. The one that I saw had no Welsbach mantel at all.

Mr. Thayer—There seem to be two kinds of those street arcs; one is a form that takes the place of the old gas street lamp on a post and the other is the arc-lamp which looks like an enclosed arc-lamp. I have seen them on sale, but I know of only a single plant where they have been used for some time. I think it would be a good plan for all who are interested

in the matter to write directly to the towns where they have been used. I saw them in Nampa, Idaho, and I understand that they are using them in Pocatello, Idaho, and also in Boise City.

A lengthy discussion of lamps ensued, after which Mr. Livermore made a motion that a committee of three be appointed to examine into and report on the subject of the use of gasoline for lighting purposes. The motion was seconded and carried.

The report of the committee on summer meeting was then presented by Mr. Debell, chairman.

"The committee on summer meeting beg leave to report that they recommend the holding of a summer Convention in the last week in June, or at such other time as may be set by the committee appointed to take charge of it, and that the summer meeting be held at Sheboygan, Wis.

"As chairman of that committee and as a resident of Sheboygan, Wis., I wish to say that it will probably be as convenient a place to hold a summer meeting as the Convention can select. The climate is cool and pleasant at that time of the year, and while we have no particular attractions there, we have the lake which is enjoyed by a great many, nice grounds, and the entertainment features will be created by the entertainment committee."

After some discussion as to whether it would be advisable to hold the meeting in Sheboygan or Madison, the former place was decided upon.

Prof. W. E. Goldsborough, of Purdue University, then read a paper on the subject of "Synchronous Converters."

During the course of the reading of his paper Prof. Goldsborough said:

"You might say in constructing the machine you should make some conductors bigger than others because they have to carry more current than others. That, unfortunately, cannot be carried out for the reason that as the phase of the alternate current changes, that is, as you go from the 100 power factor in the machine to say a lag of 85 degrees, when you would get approximately 80 per cent. power factor, the conductor which has the minimum amount of current in it also changes."

At the conclusion of the reading of the paper Mr. Livermore offered the following motion:

I move that a vote of thanks be extended to Prof. Goldsborough for his able and interesting paper, which has made clear to the Convention some of the most intricate developments of the alternating current.

Motion seconded and unanimously carried.

An adjournment was then taken until 2:30 P.M. the same day.

THURSDAY—AFTERNOON SESSION.

President Norcross called the meeting to order at 2:30 P.M.

The Committee on Nominations presented the following report, recommending that the following officers be nominated;

President—E. L. Debell.

First Vice-President—S. B. Livermore.

Second Vice-President—W. Worth Bean.

Secretary and Treasurer—Thomas R. Mercein.

Directors—L. E. Kerns, Wisconsin; J. H. Harding, Indiana, and Charles Cuno, Wisconsin.

A motion was then made that the committee's report be accepted and that the recommendations therein be adopted, and that the Secre-

tary cast the unanimous ballot of the Association under suspension of the rules for the nominees, and that they be declared the duly elected officers of the Association for the ensuing year.

This was done and the nominees were declared duly elected.

Mr. Debell was escorted to the chair.

President Norcross—It gives me great pleasure to state that Mr. Debell has been elected to succeed me. I wish to thank the Association for the courtesies extended to me during the past year, and will turn over the duties and honors to my successor.

Mr. Debell (in chair)—I understand you have done me the honor to elect me President of this Association, and I sincerely consider it an honor and thank you very kindly for it and hope that I will do as well as our former Presidents. I doubt very much whether this will be so, but I shall certainly do whatever I can in this or any other capacity for the interests of this Association.

The Secretary—I move that a vote of thanks of this Association be extended to the retiring President, the Hon. Pliny Norcross, for his faithful and efficient services during the past year.

Seconded and unanimously carried.

The discussion of Prof. Goldsborough's paper was then taken up.

Mr. P. D. Wagoner next read a paper entitled "The Series Incandescent Lighting System of the Future," which was discussed by Messrs. Livermore, Wagoner, Debell, Hewitt and others.

Prof. D. C. Jackson, chairman of committee on correspondence schools, then presented a report on the subject of "The Trade Education of Central Station Employees."

Mr. Gille—I move that a vote of thanks be extended to Prof. Jackson and the other members of his committee for the very able paper, and that the committee be continued.

Motion seconded and unanimously carried.

An interesting discussion followed after which the meeting adjourned until 10 o'clock January 18.

FRIDAY MORNING, JAN. 18.

The meeting was called to order by the President, and there being little or no business to transact the Convention on motion adjourned.

American Institute of Electrical Engineers

The 150th meeting will be held at 12 West 31st street, New York City, Friday, January 25, at 8:15 P.M. A paper will be presented by Prof. W. Elwell Goldsborough, of Lafayette, Ind., on "Air Gap and Core Distribution."

A paper will also be presented by William B. Vansize, of New York City, on "A New Page Printing Telegraph," illustrated by lantern slides.

Applications have been received from the following candidates which will be acted upon February 22d: George L. Hoxie, Ithaca, N. Y.; Robert G. Brown, Brooklyn, N. Y.; Henry F. Sanville, Norman Leeds, New York; Guy L. Bagley, Yokohama, Japan; Calvert Townley, Boston, Mass.

The Executive Committee will meet at 26 Cortlandt street at 3 P.M., on Friday, January 25.

The plans for an electric railroad between Rome and Naples in Italy are about completed.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended January 16:

Antwerp, 30 packages, \$4,700; Argentine Republic, 139 cases, \$8,513; Australia, 112 cases, \$35,831; 26 packages electrical material, \$11,655; Brazil, 256 packages, \$15,483; 136 cases, \$63,575; Bristol, 1 case, \$50; British East Indies, 2 packages, \$15; 3 cases, \$2,434; British Guiana, 33 cases, \$868; British Possessions in Africa, 18 packages, \$1,691; British West Indies, 88 cases, \$2,434; 2 cases motor vehicle parts, \$328; Central America, 9 packages, \$324; China, 2 cases, \$132; Cuba, 60 packages, \$132; Danish West Indies, 10 packages, \$138; Dutch West Indies, 17 packages, \$852; Ecuador, 5 cases, \$109; Genoa, 30 packages, \$22,043; Glasgow, 298 packages, \$31,231; Hamburg, 127 packages, \$8,980; Havre, 74 packages, \$9,225; 2 packages auto vehicles, \$2,520; Japan, 256 packages, \$27,180; 1 automobile, \$750; Korea, 53 packages, \$2,555; Liverpool, 253 packages, \$9,926; 80 packages motor trucks, \$3,800; London, 163 cases, \$4,700; 188 packages, \$17,117; Mexico, 159 cases, \$8,236; 1 case auto parts, \$17; 2 packages, \$17; Newfoundland, 18 packages, \$2,475; Newcastle, 233 packages, \$8,400; 2 cases, \$150; Nova Scotia, 6 packages, \$236; Peru, 88 packages, \$3,474; Philippines, 187 packages, \$12,810; Rouen, 1 case, \$140; Southampton, 24 packages, \$127; U. S. Colombia, 7 cases, \$720; Venezuela, 10 packages, \$145.

PERSONAL MENTION.

Mr. Frederick A. Gilbert, the president and general manager of the Boston Electric Light Company, died suddenly in New York City January 18.

Mr. James R. Wilson was recently elected a director of the Royal Electric Company of Montreal, Can.

Mr. William A. Kahn, erecting engineer for the Edward P. Allis Company, recently returned to Milwaukee, Wis., from London, Eng., where he had been for a year and a half superintending the erection of the electric lighting system which has been installed there.

Mr. James R. Chapman, for several years the electrical engineer for the Union Traction Company, Chicago, has been appointed by Charles T. Yerkes to superintend the construction and equipment of the underground rapid transit system in London.

Mr. J. H. Whitaker was recently appointed city electrician of Tacoma, Wash., in place of O. N. Wiswell who resigned.

Mr. Edwin Holmes, the president of the Holmes Electric Protective Company and promoter of various electrical enterprises, died at his home, 32 West 52d street, in this city, January 17, after an illness of about a year.

Mr. T. C. McReynolds, of Kokomo, Ind., will succeed to the superintendency of the Kokomo electric light and street railway plants, W. O. French retiring.

INCORPORATIONS.

The National Improved Trolley-Harp Company, Indianapolis, Ind. Capital stock, \$5,000. Directors: Maurice Donnelly, Joseph W. Brooks, Peter Kretzer and Charles Glening.

The Plymouth Electric Light Company, Indianapolis, Ind. Capital stock, \$10,000. Directors: M. W. Simmons, Ellen B. Simmons and F. Celeste Simmons.

The Northern Ohio Electric Company, Defiance, O. Capital stock, \$25,000. Incorporators: W. D. Sherwood, E. Bartholomew, H. C. Warren and J. U. Merwin.

The North Coast Electric Company, Tacoma, Wash. Capital stock, \$25,000.

The Sullivan Electric Company, Sullivan, Ill.—to operate a light, heat and power plant. Capital stock, \$50,000. Incorporators: J. H. Baker, W. A. Steele and A. J. Patterson.

The Freehold Electric Light, Heat & Power Company, Trenton, N. J. Capital stock, \$10,000.

The Electric Mining & Milling Company, Fair Play, Col.—to operate in Park County. Capital stock, \$1,000,000. Directors: H. G. Chase, O. A. Young and T. L. Lintz.

ELECTRICAL PATENT RECORD.

LATTERS PATENT ISSUED JANUARY 8, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

- 665,404. Electromagnetic Brake. Edwin P. Carpenter, Pawtucket, R. I. Filed Sept. 9, 1899.
 665,450. Electric Brake for Vehicles. Joseph N. Mahoney, New York City, assignor to Price, Darling & Co., same place. Filed Feb. 12, 1900.
 665,540. Means for Generating Electricity from Car-Wheel Axles. Morris Moskowitz, New York City. Filed March 13, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

- 665,422. Globe-Holder for Arc-Lamps. Richard Fleming, Lynn, Mass., assignor to the General Electric Company of New York. Filed Sept. 25, 1899.
 665,541. Electric-Lighting System. Morris Moskowitz, New York City. Filed April 13, 1900.
 665,582. Lamp-Socket. Howard R. Sargent, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Aug. 14, 1900.
 665,657. Pendant for Gas, Electric, Oil or Other Lights. Harry Hateley, Erdington, Eng. Filed Dec. 8, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 665,423. Electromagnetic Cut-Out. Richard Fleming, Lynn, Mass., assignor to the General Electric Company of New York. Filed Nov. 24, 1899.
 665,427. Electrolytic Apparatus. William T. Gibbs, Buckingham, Canada, assignor, by direct and mesne assignments, to the National Electrolytic Company of New York. Original application filed Sept. 9, 1895. Divided and this application filed Oct. 8, 1900.
 665,486. Dynamo-Electric Machine. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Oct. 25, 1900.
 665,492. Electric Switch. Charles L. White and Frank W. Cole, Chicago, Ill. Filed March 30, 1899.
 665,514. Electric Switch. William Ely, Providence, R. I. Filed Aug. 13, 1898.
 665,573. Transformer. Walter S. Moody and William L. R. Emmet, Schenectady, N. Y., assignors to the General Electric Company of New York. Filed Oct. 26, 1900.
 665,586. Direct Current Dynamo-Electric Machine. Wilhelm V. Siemens and August Roth, Berlin, Germany, assignors to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Jan. 6, 1900.
 665,667. Electrical Measuring Instrument. Llewelyn B. Atkinson, Cardiff, Eng. Filed June 8, 1900.
 665,798. Electrical Measuring Instrument. Camillo Olivetti, Ivrea, Italy. Filed Aug. 9, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

- 665,548. Telephonic System. Leon W. Pullen, Camden, N. J. Filed May 23, 1899.
 665,639. Telephone-Transmitter. Takeo Iwata, Tokio, Japan. Filed Oct. 25, 1899.
 665,788. Attachment for Telephones. David Laing and George M. Ferry, Duquesne, Pa. Filed May 2, 1900.
 665,834. Coin-Operated Magnet-Bell for Telephones. Heber R. Mason, Ludington, Mich. Filed June 16, 1899.
 665,848. Telephone-Switch. Nathan Bassett, Philadelphia, Pa., assignor to the Globe Telephone Manufacturing Company, same place. Filed May 3, 1900.

MISCELLANEOUS.

- 665,421. Machine for Restoring Insulated Wire. James B. Fleming, Detroit, Mich. Filed Jan. 15, 1900.
 665,426. Art of Obtaining Chlorates by Electrolysis. William T. Gibbs, Buckingham, Canada, assignor, by direct and mesne assignments, to the National Electrolytic Company of New York. Filed Sept. 9, 1895.
 665,449. Brush-Carrier. Carl W. Larson, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Oct. 23, 1899.
 665,539. Means for Generating Electricity from Axles of Locomotive-Trucks. Morris Moskowitz, New York City. Filed March 13, 1900.
 665,609. Electrical Battery. Charles B. de Lamarre, Biloxi, Miss. Filed Aug. 15, 1900.
 665,625. Primary Battery. Harry S. Amwake, Camden, N. J., assignor of one-half to Joseph H. Wilson and Abraham M. Geisinger, Philadelphia, Pa. Filed March 2, 1900.
 665,636. Electric Cable. Robert K. Gray, London, Eng. Filed May 23, 1900.
 665,664. System for Heating Conductors of the Second Class. Carl D. Raab, Kaiserslautern, Germany. Filed April 30, 1900.
 665,676-665,677. Junction-Box for Electrical Conductors. Edwin T. Greenfield, New York City. Original application filed July 9, 1900. Divided and this application filed Sept. 13, 1900.
 665,679. Electric Battery. Robert E. Hall, Bridgeport, Conn., assignor to the Waterbury Battery Company, Waterbury, Conn. Filed Dec. 15, 1899.

- 665,704. Electric Furnace. George S. Strong, New York City. Filed April 4, 1896.
 665,734. Type-Printing Telegraph. Adolf Franke, Berlin, Germany. Filed Jan. 18, 1899.
 665,782. Primary Battery. Henry K. Hess, Philadelphia, Pa., assignor to Herman J. Dercum, trustee, same place. Filed Jan. 11, 1899.
 665,783. Process of Regenerating Spent Elements of Primary Batteries. Henry K. Hess, Philadelphia, Pa., assignor to Herman J. Dercum, trustee, same place. Filed July 13, 1899.
 665,784. Apparatus for Regenerating Spent Elements of Primary Batteries. Henry K. Hess, Philadelphia, Pa., assignor to Herman J. Dercum, trustee, same place. Filed Aug. 9, 1899.
 665,901. Electric Burglar-Alarm. John W. Rough, Orleans, Ind. Filed April 2, 1900.
 665,810. Apparatus for Generating Electricity. Joseph Stretch, East Orange, N. J. Filed May 21, 1900.
 665,827. Manufacture of Storage-Battery Plates. John L. Creveling, New York City. Filed May 23, 1900.
 665,856. Electric Burglar-Alarm System. Emil Biedermann, and Leopold A. Heine, Chicago, Ill. Filed April 23, 1900.

DESIGN.

- 33,971. Electric Vehicle Body. Charles G. Burrows, Windsor, Conn., assignor to the Eddy Electric Manufacturing Company, same place. Filed June 27, 1900. Term of patent 7 years.

LATTERS PATENT ISSUED JANUARY 15, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

- 666,080. Electrically Controlled and Operated Railway-Switch. Philip B. Williams, Washington, D. C. Filed Oct. 11, 1900.
 666,177. Trolley-Finder for Electric Cars. Edwin S. Booth, Waterville, Me. Filed Sept. 19, 1900.
 666,183-666,184. Electromagnetic Brake. Francis L. Clarke, Pittsburg, Pa., assignor to the Westinghouse Air Brake Company, same place. Filed May 14, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

- 665,882. Electric-Arc Lamp. James A. Dalzell, Lynn, Mass., assignor to the General Electric Company of New York. Filed Dec. 7, 1898.

ELECTRICAL MACHINERY AND APPARATUS.

- 665,888. Cut Out. William L. R. Emmet, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed July 27, 1899.
 665,902. Dynamo-Electric Machine. Harry E. Heath, Windsor, Conn., assignor to the Eddy Electric Manufacturing Company, same place. Filed June 7, 1900.
 665,903. Rheostat. Edward M. Hewlett, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Nov. 13, 1900.
 665,928. Electrical Cut-Out. Charles G. Perkins, Hartford, Conn. Filed Jan. 17, 1900.
 665,943. Electric Cut-Out. John H. Trumbull, Plainville, Conn., assignor to Charles G. Perkins, Hartford, Conn. Filed April 2, 1900.
 666,105. Electric Igniter for Explosion-Motors. Charles E. Lufbery, Chauny, France. Filed Oct. 14, 1899.
 666,121. Means for Controlling Electric Motors. Montgomery Waddell, New York City, assignor, by direct and mesne assignments, to the General Electric Company of New York. Filed March 23, 1897. Renewed Jan. 18, 1897.
 666,122. Method of Controlling Electric Motors. Montgomery Waddell, New York City, assignor to the General Electric Company of New York. Original application filed Jan. 18, 1897. Divided and this application filed Dec. 13, 1900.
 666,196. Magnetic Stop. Frank P. Howe, Philadelphia, Pa. Filed July 3, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

- 665,874. Apparatus for Telephone Toll-Lines. Albert M. Bullard, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 7, 1899.
 665,923. Telephone Appliance. Frank R. McBerty, Downer's Grove, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed Aug. 12, 1897.
 666,190. Germicide Device for Telephone-Transmitters. Adolph B. Larsen, Minneapolis, Minn., assignor of one-half to Frank F. Carlson, same place. Filed April 27, 1900.
 666,213. Telephone-Exchange Circuit and Appliance. George K. Thompson, Malden, Mass., assignor to the American Bell Telephone Company, Boston, Mass. Filed Feb. 9, 1900.

MISCELLANEOUS.

- 665,915. Process of Electrolytic Production of Nickel or Allied Metals. Moritz Kugel, Berlin, Germany. Filed March 24, 1900.
 665,950. Towing Apparatus for Boats. Herbert W. Alden, Hartford, Conn., assignor to the Electric Vehicle Company, Jersey City, N. J., and New York City. Filed Sept. 8, 1899.

- 665,954. Method of Manufacturing Electroplates. Warren C. Clouse, Kearny, N. J., assignor, by mesne assignments, to the Charles Craske Company. Filed Nov. 14, 1898.
 665,957. Receiver for Hertzian Electric Waves. Eugene Ducretet, Paris, France. Filed May 23, 1899.
 665,998. Acceleration Limiting and Recording Device. Albert G. Davis, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Sept. 29, 1900.
 666,003-666,004. Insulated Electric Conductor. William L. R. Emmett, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Aug. 19, 1899.
 666,153. Process of Producing Plates for Secondary Batteries. Charles Pollak, Frankfurt-on-the-Main, Germany. Filed Feb. 12, 1897.
 666,157. Electric Welding Apparatus. Adolph F. Rietzel, Lynn, Mass., assignor to the Thomson Electric Welding Company, same place. Filed Sept. 28, 1900.
 666,161. Electric Metal-Working Apparatus. Elihu Thomson, Swampscott, Mass., assignor to the Thomson Electric Welding Company, Lynn, Mass. Filed July 3, 1899.
 666,162. Transforming Apparatus for Electric Metal-Working. Elihu Thomson, Swampscott, Mass., assignor to the Thomson Electric Welding Company, Lynn, Mass. Filed July 3, 1899.
 666,185. Thermostatic Appliance for Boltwork. George L. Damon, Boston, Mass., assignor to Arolyn P. Damon, same place. Filed Feb. 9, 1898. Renewed Dec. 11, 1900.

COMMERCIAL PARAGRAPH.

Miniature Arc Lamps, consuming a small amount of current, giving nominal 800 cp., are now finding great favor with both central stations and isolated plants.

The Safford Arc Lamp Mfg. Co., Buffalo, N. Y., is now putting on the market a neat appearing and substantial lamp, a cut of which will be found below. It has been its aim, it states, to produce a perfect Enclosed Miniature Arc Lamp, that would take the place of clusters of incandescent lamps heretofore so commonly used, and greatly increasing the light from an equal amount of current and making a much handsomer looking fixture than it is possible to get with any combination of incandescent lamps.

The Safford Lamp is built on a double solenoid principle

SAFFORD MINIATURE ARC LAMP.

2½ amperes, 110 volts, D. C.
 14 inches over all.
 8 pounds complete.

with a balancing resistance in series with the arc. The solenoids are securely fastened to a light casting forming the framework of the lamp. The series resistance is held on porcelain insulation fastened to the cap of the lamp, and the series resistance wound spirally in grooves, which will not permit its lagging in case of excessive heating, due to a rise in the voltage. The company's trimming device is very simple, being only necessary to place the inner globe against the enclosing cap which is fixed, and two turns of the bottom carbon holder brings it to place, which makes an absolute enclosure, greatly increasing the length of life of the lamp, and making it possible to burn a very steady arc. Owing to the shape and thickness of the inner globe the breakage of globes, so common the company says in all other arc lamps, has been greatly reduced, the life of an inner globe being several months, if ordinary care is used in trimming. These lamps are made for both in and outdoor use on direct current circuits, and we understand that the excellent workmanship and handsome design has made them great favorites wherever used.

The company's new bulletins describing the types of this lamp can be had for the asking. The Safford Company is located at 297-299-301 Washington street, Buffalo, N. Y.

THE TELEPHONE WORLD.

Erie Telephone Changes.

At a special meeting of the Erie Telegraph & Telephone Company, held January 17 in Boston, new managers, representing the Old Colony Trust Company syndicate, assumed charge of the company's affairs. Charles J. Glidden resigned the office of president, and Charles A. Grant resigned as treasurer.

In his statement to the directors, President Glidden said, in part: "The new board of managers of the Erie Company to-day assume full control of the property known as the Erie Telephone system, the largest in the United States, operating in eight States nearly 145,000 telephone stations and more than 250,000 miles of wire, fully one-sixth of the Bell plant. More than \$21,000,000 has been spent on the property within the past three years."

The People's Home Telephone Company of Birmingham, Ala., which will compete with the Southern Bell Telephone & Telegraph Company, announces it will be ready for regular business on February 1. Already 'phones are put up in many subscribers' houses, and the company is assured of profitable support. The company has lines to all the suburban towns in the district, and in the larger places has exchanges, assuring the patrons a first-class service in the city and the towns within a radius of six or ten miles. The People's Home Telephone Company was organized with Birmingham and Youngstown, O., capital. It is incorporated at \$300,000, and all of its apparatus is first-class.

J. B. Ware, president of the Michigan Independent Telephone Association, says that the State meeting will be held in Lansing February 7. The object of the meeting is to provide means and discuss ways whereby the independent companies will be benefited. Another feature to be discussed that is of vast importance is the advisability of having a law passed establishing a low uniform rental for telephones for cities of a certain size, the amount to vary with the number of telephones in use.

The Gordon Telephone Company has let contracts for poles to be used in the construction of the extension line from Charleston to John's Island, Wadmalaw, Young's Island and Edisto, S. C. Other material for this line has already been ordered and it is expected there within the next two weeks. Actual work of construction will be begun February 1.

Articles of incorporation have been issued to the Northwestern Telephone Company, with headquarters at Neligh, Neb. The company is being organized by J. C. Jenkins, Thomas Kryger and H. B. Houser, and the principal portion of the capital stock, \$1,000, was subscribed there. A local exchange will be put in at Neligh as soon as the weather permits and lines run to neighboring towns.

The Southern Telephone Construction Company has recently been organized in Knoxville, Tenn., with W. O. Rhode and W. S. Roberts, of Knoxville, and C. L. Meyers, of Nashville, as executive officers. They have until recently been with the Cumberland Telephone Company in official capacities. They will build independent telephone lines all over the South and in Mexico.

The city of Bardwell, Ky., recently sold a telephone franchise to the American Telephone Company of St. Louis. That company has determined to enter the telephone field in Western Kentucky, and the exchange at Bardwell will be used as a relay station.

Stockholders of the Erie Telegraph & Telephone Company will hold a special meeting in this city on January 31, when a vote will be taken on the proposition to reduce the number of directors from twenty-five to fifteen. Three classes of directors will be elected, to serve from one to three years.

The Macomb County Telephone Company of Mt. Clemens, Mich., recently elected the following officers: President, G. R. Lovejoy; vice-president, J. A. Heath, Richmond; secretary, S. B. Spier. The company expects to have its exchange running by the 1st of April.

Jerome Herff, of Peru, Ind., has been granted a franchise for an independent city telephone system to oppose the Central Union, which now has 320 instruments. The members of the new company are said by Mr. Herff to be Peru capitalists.

A local telephone system is talked of by Wells, N. Y. residents. The Bell Company, it is claimed, charges exorbitant rates, and gives an unsatisfactory service.

There is an effort being made to extend the Louisa telephone system to Ashland, Va., if a sufficient number can be obtained who will take the service.

The annual meeting of the West Canada Telephone Company was held a short time ago at Trenton Falls, N. Y. The following directors were elected for one year: Josiah W. Jenkins, Charles H. Clark, Walter W. Martin, Wm. Wheeler, James E. Jenkins, Sewell E. Harvey and John Frinkle. Immediately after the meeting of stockholders the directors met and elected the following officers: Josiah W. Jenkins, president; Sewell E. Harvey, vice-president; Wm. Wheeler, secretary; Charles H. Clark, treasurer. The company which has been recently organized, intends to construct a telephone line from Trenton Falls to Morehouseville, taking in the towns of Hockley, Grant, Ohio, Wilmurt and Noblesboro, with branches therefrom to Poland, Wilmurt, Sheriff, Pine and G. Lakes. Part of the line has already been constructed.

News from Chester, Pa., states that the local telephone companies in the cities and towns in that part of the United States will combine for the purpose of furnishing a long-distance service. Nearly all of the towns and cities now have companies with simply a local circuit, as is the case with the Delaware County Telephone Company in Chester, and a union of all these companies under one management for long distance lines, it is said, will soon be effected. Efforts are being put forth to that end and it is believed that the accomplishment of the plan is not far distant. The Delaware County Company now has a large number of telephones in use in Chester and vicinity and some of the subscribers have been urging that Philadelphia connections be secured, as there is a constant demand for this service.

The independent telephone companies of Kansas, organized in Salina a short time ago, under the name of the Kansas Independent Telephone Association. S. C. Crummer, of Beloit, was elected president, and W. W. Dilworth, from the same city, secretary. About thirty delegates were present, representing 5,000 'phones and over 1,500 miles of toll line. Every part of the State except the extreme northeast and southeast portions was represented. One of the main objects of the meeting was the adoption of a uniform toll of 25 cents for a distance of not over forty miles on any line, and 10 cents for each additional forty miles or fraction thereof.

The directors and stockholders of the Plattsmouth, Neb., Telephone Company held their annual meeting recently, and declared a dividend of 10 per cent., payable March 1. The stockholders expressed themselves as more than satisfied with the business of the company and heartily pleased with their investments.

From Parkersburg, W. Va., comes the report that the stockholders of the West Virginia Western Telephone Company lately met in annual session. The fact that there were no changes whatever made in the directory of officials demonstrates that the stockholders were pleased with the condition and management of the affairs of the company, and that the patrons are satisfied with the service.

The Missouri River Telephone Association, composed of toll lines and local exchanges in Northwest Missouri, Southern Iowa and Eastern Kansas, was recently organized at a meeting held in the Citizens' Telephone Company's office in St. Joseph, Mo. About twenty exchanges were represented.

According to a Minneapolis, Minn., paper, the Stromberg-Carlson Telephone Company wants a hand in the proceeding to secure the appointment for a receiver for the Mississippi Valley Telephone Company and has filed an intervening complaint in which it claims to have about \$7,000 coming from the telephone concern.

The Pennsylvania Telephone Company has been granted a franchise to extend its lines through Hanover, Pa. The Bell people have been fighting for this franchise, but were never able to get the votes of a majority of the council for the reason that their competition, it was feared, might eventually exterminate the local company.

The Martin Telephone Company at Webster City, Ia., will put meters on its residence instruments, and a regular rate will be charged for 300 outgoing calls, no charge being made for incoming calls. In excess of the 300 calls per year the calls will be charged five cents each.

The Cumberland Telephone & Telegraph Company has opened up an exchange at Adams, Tenn., with about forty subscribers. Mr. W. J. Tomerlin, of Springfield, Tenn., is manager.

During a recent storm in St. Joseph, Mich., the Bell Telephone Company suffered great damage from the sleet and ice. The loss to the company is estimated to be \$3,000. New wires will probably be necessary.

Charles R. Lee, special agent for the Cumberland Telephone & Telegraph Company at Cheneyville, La., has recently been working up an exchange, to be connected with Bunkie in that State. This will give the long-distance connections to New Orleans, Alexandria, Memphis, and, in fact, with the entire country from that exchange when put in operation. Mr. Lee claims that the line will very soon be established, and when put in operation the company intends to extend its lines throughout the parish, so that all plantations desiring telephonic communication can have their wishes gratified. The citizens are well pleased with the prospect, and have subscribed liberally wherever called on.

At the recent annual meeting of the Saco River, Me., Telephone & Telegraph Company the following officers were elected: President, F. H. Hargraves; vice-president, Dr. Martin Coffin, Bar Mills; superintendent, treasurer and secretary, E. A. Hobson, West Buxton.

The Woodford Telephone Company has completed the elevation of a fifty-two line cable through Philippi, W. Va. This company will soon have connections made so that its service will be second to none in the State.

The local telephone exchange in Stockton, Kan., established by the Greenleaf Telephone Company is completed and in full operation with about eighty subscribers, and the probability of a material increase in the near future.

GENERAL ELECTRICAL NEWS.

Lighting.

Aberdeen, S. D.—The board of county commissioners has decided to put in an independent lighting plant in the county jail.

Apalachicola, Fla.—The Cypress Lumber Company contemplates installing an electric light equipment to light its lumber mills.

Belington, W. Va.—The proposition to erect an electric lighting plant here to be owned by the city was carried by a large majority at a recent election.

Beresford, S. D.—The city council has granted to N. Crill of Elk Point a franchise to erect an electric light plant in this place.

Buford, Ga.—This city will erect an electric light plant.

Canfield, O.—At a recent council meeting a franchise was granted to C. C. & J. R. Fowler, D. E. Anderson and H. A. Ernst of Youngstown to establish and maintain an electric light plant.

Dothen, Ala.—This city will issue bonds for the erection of an electric light plant.

Dublin, Ga.—The Dublin Electric Light & Waterworks Company will make improvements to its plants.

Emporia, Va.—There is a movement on foot to have this town lighted by electricity at an early date. Arthur Satterwhite is the promoter of the enterprise.

Fond du Lac, Wis.—Business men of this city have organized a stock company for the purpose of installing an electric light plant. The company will be incorporated with \$10,000 capital stock.

Glidden, Ia.—J. and F. Everts have made a proposition to install an electric light plant here.

Grayville, Ill.—A special election will be held in this city on February 5 for the purpose of submitting to a vote of the people the question of purchasing the electric light plant.

Greenville, Ill.—A new electric light company is being organized at this place with \$10,000 capital. Mayor Ed. DeMoulin.

Gulfport, Miss.—The Gulf & Ship Island Railroad Company was recently granted a franchise to operate an electric light plant here.

Hinton, W. Va.—The Hinton Light, Ice & Fuel Company will erect an electric light plant of 2,000 incandescent and 85 arc lights. Address J. Leslie.

Humphrey, Neb.—Plans are being formulated for the erection of a new electric light plant in this city. The projectors are H. J. Breunig, J. E. Hugg and B. Martyn.

Hutchinson, Minn.—An ordinance was lately passed granting privileges to the Hutchinson Lighting & Manufacturing Company for the establishment of an electric light plant in this village.

Loveland, Col.—A franchise for ten years was given to L. J. Kelim to install and operate an electric light plant.

Magnolia, Miss.—Plans and specifications have been submitted by C. H. Jenks, supervising engineer for the new electric light plant to be erected in this city in the near future, for which bids will soon be advertised for. J. H. Price is president.

Millbury, Mass.—The Worcester & Blackstone Valley Street Railway Company directors recently voted to build a new power station of 1,000 horse power at this place to cost \$50,000.

Morris Run, Pa.—The Morris Run Coal Mining Company proposes putting in an electric light plant for commercial lighting.

Mount Holly, N. J.—The township committee has awarded a contract for lighting the streets by electricity to a new company to be formed by the citizens of this place.

Nashville, Tenn.—C. S. Brown, mechanical engineer, will design and supervise the construction of a \$150,000 municipal electric lighting plant.

New Ulm, Minn.—Aldermen Eibner and Manderfield and City Attorney Eckstein have been appointed to gather information about electric light plants for the benefit of the citizens, who will vote on the question of municipal ownership at the spring election.

Norfolk, Va.—The Norfolk Light, Heat & Power Company will erect a \$22,000 electric light plant.

Ord, Neb.—A representative of Fairbanks, Morse & Co. of Omaha is here arranging to put in an electric light plant.

Ravenswood, W. Va.—An election will be held January 24 to vote on the question of issuing \$7,000 in bonds to build a new electric light plant here.

Sublette, Ill.—The question of erecting an electric light plant is being agitated here.

Tarrytown, N. Y.—The trustees of this village have called for a special election to vote on the proposition, "Shall the village bond the town for \$35,000 to own its electric plant?"

Tuscumbia, Ala.—H. Barry of Huntsville has received a franchise for the erection of an electric light plant here.

Street Railways.

Bound Brook, N. J.—It is the intention of the Jersey Central Road to install an electric block signal system on its entire line between here and White Haven.

Canandaigua, N. Y.—Plans are being made for an electric road from this city to Palmyra. A new company is at the head of the enterprise, and is represented here by O. N. Crane.

Chatham, Ont.—Ypsilanti, Mich., capitalists propose building an electric road from Windsor to this place. Joseph Webb, representing the American capitalists, met the railway committee of the Chatham and the Kent County councils, and this joint committee passed a resolution promising to give the road all possible support.

Cincinnati, O.—Negotiations are under way for the construction of a traction line between this city and Dayton via Norwood, Pleasant Ridge, Montgomery, Foster's Crossing and Lebanon. L. C. Black, T. R. French and A. McCullough are the promoters.

Crawfordsville, Ind.—C. Fairbanks, H. C. Brubaker and F. Woods have petitioned the commissioners of Montgomery County for a franchise for an electric street railway line through the county. The road will run from Indianapolis to this place via Danville, North Salem and Ladoga.

Greenville, Pa.—The Greenville Street Railway Company has lately been incorporated with \$50,000 capital stock to build a trolley line in this place, a distance of five miles. J. H. McCafferty is president.

Lorain, O.—The stockholders of the Lorain & Cleveland Electric line contemplate the increase of the capital stock from \$700,000 to \$1,000,000. President B. Mahler announces the money will be used for improvements.

Puyallup, Wash.—F. E. Sander was recently granted a 50-year franchise by the commissioners of Pierce County to construct an electric railway across the Puyallup reservation.

Manufacturing.

Kittery, Me.—The National Fire Alarm Company has been organized here for the purpose of manufacturing electric fire alarm systems, with \$100,000 capital stock. The officers are: President, Clifford B. Sanborn, of Boston; treasurer, Walter J. Partridge, of Norwood, Mass.

New Haven, Conn.—The Rice & Baldwin Electric Company of this city has been formed for the purpose of manufacturing and dealing in electrical supplies and doing a general business in electrical work with a capital of \$10,000. The stockholders are William A. Rice, Edward M. Baldwin and William F. Simpkin of this city.

St. Louis, Mo.—The Imperial Electric Plating & Manufacturing Company was incorporated recently for \$5,000, held by J. S. McKinley, F. R. Harris and F. L. Morton.

Topeka, Kan.—The firm of Townsend & Dooley, of Des Moines, Ia., has decided to establish a factory here for the purpose of manufacturing lightning rods, static machines and X-ray machines.

Winsted, Conn.—Waldo L. Curtis, of this place, has organized the Hartford Motor Machine Company, with a capital stock of \$250,000. The company controls the patents on a motor street sweeper, which was invented

by John T. Collins of Hartford, and will engage in manufacturing and placing the sweeper on the market

Company Matters.

Berlin, Wis.—The Prouty Motor Company of Chicago, capitalized at \$100,000, wants to remove to this city.

Brockton, Mass.—The work and salesrooms of the Miliard Electrical Company were destroyed by fire a short time ago.

Buffalo, N. Y.—At the recent annual meeting of the Salamanca Waterworks & Electric Light Company the following officers were elected: President, Hudson Ansley; secretary and treasurer, H. O. Waite; superintendent, A. H. Krieger.

Chester, Pa.—John D. Rigg was re elected president of the Traction Company and the Chester & Delaware Street Railway at the annual meeting held in this city last week.

Waterville, N. Y.—The Waterville Electric Light & Power Company recently elected the following officers: H. B. Sweet, president, M. W. Terry, secretary and treasurer; J. W. Candee, M. W. Terry and H. B. Sweet, directors.

Power and Transmission.

Ashley, Mo.—The Laclede Power Company will erect a power house between here and O'Fallon to cost \$55,000.

Jackson, Mich.—The Boland interests which are building an electric railroad to Ann Arbor will erect a power plant which will cost \$250,000.

Los Angeles, Cal.—The United Electric, Gas & Power Company of this city has decided to extend its service to Redondo. It will run a line of transmission from here to Redondo, and give the people of the neighboring seaside town an all night service, and also furnish power for any purpose desired.

New Orleans, La.—E. Craig and others have incorporated the New Orleans Power House Company with \$50,000 capital stock to build and operate electric power plants, etc.

Automobiles.

Geneva, O.—A company with \$100,000 capital has been organized, to be known as the Geneva Automobile & Manufacturing Company. J. A. Carter is manager of the new enterprise.

Indianapolis, Ind.—Carl G. Fisher, an automobile and bicycle dealer in this city, has sold his business to C. Koehring & Bro. Mr. Fisher announces that he will associate himself with a manufacturer of automobiles in the near future.

Morristown, N. J.—Mayor Norman L. Fox and other prominent citizens here are inquiring into the cost of conducting an automobile line between this place and Madison. For this purpose a company will be organized with a capital stock of \$100,000.

New Haven, Conn.—This city is likely to be in the near future the home of another automobile manufacturing company. The Woods Motor Vehicle Company of Chicago has been looking over a good site in this city, and the managers have expressed themselves as pleased with the outlook.

Plainfield, N. J.—The Plainfield Automobile Company is perfecting its plans for the establishment of an automobile omnibus line to run over a route which will include many of the streets in parts of the city not now invaded by the local trolley system. The New York Motor Vehicle Company has become interested in the project and will furnish the carriages for the service.

Pottstown, Pa.—John R. Saylor and W. I. Grubb two manufacturers of this place, are each perfecting horseless vehicles of their own design.

Ripon, Wis.—Articles of incorporation of the W. E. Schaefer Manufacturing Company of this city were recently filed. This concern has a capital stock of \$40,000 and will make a specialty of the manufacture of automobiles, launches and bicycles. The chief stockholder is W. E. Schaefer.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex-div.

The United Railways & Electric Company comprises in its organization the Baltimore Consolidated Railway Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co. of Baltimore. The pref. stock of U. R. & E. Co. has been issued in the form of income bonds.

^a Leased to Boston Elevated Railroad Company.

^b Owned by Brooklyn Rapid Transit Company.

^c Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.

^d Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.

^e Road owned by Kings County Traction Company; road leased to Nassau Electric RR.

^f Owned by Atlantic Ave. RR. and leased to Nassau system.

^g \$50 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$250.00 of stock owned by North Chicago Street Railroad Company.

^h Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.

ⁱ 35 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$25.00 of stock owned by West Chicago Street Railroad Company.

^j Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by West Chicago Street Railway Company, lessee.

^k Cincinnati St. Railway purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. § Ex-div.

^a Leased to New Orleans Traction Company at 6 % on stock.

^b Leased to New Orleans Traction Company at 8 % on stock.

^c Leased to Central Crostown Railroad at 8 % on stock and interest on bonds.

^d Operating the former Met. Trac. system, that corporation having become extinct.

^e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.

^f Leased to Houston, West Street & Pavyon Ferry—now Metropolitan Street Ry.

^g Leased to Metropolitan Street Ry. at 8 % on stock until Oct. 1, 1897; thereafter 9 %.

^h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1895, at \$215,000 per annum.

ⁱ Leased to Met. St. Ry. for 99 years from April 20, 1892; 6 % first 5 years, 8 % thereafter.

^j Leased to Metropolitan Street Railway for \$145,000 per annum.

^k Leased to Metropolitan Street Railway for 18 % on capital stock.

^l Controlled by Third Avenue Railroad by purchase.

^m Dividends of 1 1/2 % yearly guaranteed by Consolidated Traction Company.

ⁿ Controls by lease the Allegheny, Cent., Citizens' Duquesne, Fort Pitt & Pitt's Traction.

^o Leased to Consolidated Traction Company for 8 % per annum on par value of stock.

^p Leased to Fort Pitt Traction Company for 6 % on \$3,000,000 capital stock.

^q Leased to Consolidated Traction Company for 4 % on capital stock.

^r Leased to Consolidated Traction Company for 7 % on capital stock.

TELEPHONE AND TELEGRAPH COS.

* Unlisted. † Paid in. ‡ Full paid. ¶ Outstanding. § Ex-div.
a Leased to Hestonville, Man & Fairmount Passenger Ry. for 6% on stock per annum.
b Consolidation Electric, People's and Philadelphia Traction companies. Fixed charges and all indebtedness of constituent and leased companies assumed by Union Traction Company.
c Practically all shares owned by Union Traction Company.
d Lease to Frankford & Southwark Passenger Ry. assumed by Electric Traction Co.
e Leased to Electric Traction Company.
f Controlled by Frankford & Southwark Passenger Railway.
g Leased to People's Passenger Railway at \$5 per share.
h Majority of stock owned by People's Traction Company.
i Leased to Union Traction Company.
j Lease transferred to Union Traction Company.
k Leased to Union Traction Company at a rental of \$10,000 per annum in 1866-7-8, & \$20,000 in 1899-1900 and \$30,000 per annum thereafter, payable semi-annually, rental declared as a dividend semi-annually.
l Dividend of 10% guaranteed by Reading Traction Company.
m Dividend of 6% guaranteed by Reading Traction Company.
n Leased and operated by the Scranton Railway Co., formerly Scranton Traction Co.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¼c.; Lake, 16½@17c.; casting, 16½@16¼c.

New stock to the amount of \$5,000,000 will be issued by the Chicago City Railway.

As we go to press (Tuesday, 2:30 P. M.) the announcement of the death of Queen Victoria did not affect the stock market to any appreciable extent.

Stockholders of the Philadelphia Electric subsidiary companies will hold their annual meetings February 4.

The annual meeting of stockholders of the United Power and Transportation Company will be held February 5.

The directors of the National Carbon Company have declared the regular quarterly dividend of 1½ per cent. on the preferred stock.

The regular quarterly dividend of 2 per cent. has been declared on Bell Telephone Company, of Philadelphia, stock, payable January 28.

The Twin City Rapid Transit directors declared a dividend of 1½ per cent. on common stock, payable February 15. Books close February 9, and reopen February 18.

The South Brooklyn Railway Company reports for the quarter ended December 31, 1900: Gross earnings, \$1,377; net income, \$566; cash on hand \$323; profit and loss deficiency, \$2,610.

The annual report of the Philadelphia & West Chester Traction Company, just issued, shows gross earnings for the year ended December 31, 1900, of \$93,515, an increase over the preceding year of \$7,532.

The Worcester (Mass.) Traction Company stockholders have added to the board of directors A. George Bullock, representing Boston capitalists interested in the consolidation of the street railroads of that vicinity.

It is stated on good authority that a large part of Telegraph, Telephone & Cable Company of America loans were paid off recently and that the remaining indebtedness is only about \$300,000, owed in New York and Philadelphia.

Directors of the Chicago City Railway have authorized the issue of \$4,500,000 at par, which will be offered to stockholders. With new issue amount outstanding will be \$18,000,000. Stock is issued to pay off company's 4½ per cent. bonds.

The Massachusetts Railroad Commissioners have approved the purchase of the Globe Street Railway by the Brockton Street Railway, by changing the stock share for share, amounting to \$1,440,000, and assuming the debts of the absorbed company.

The United Gas Improvement Company, of Philadelphia, and the Connecticut Lighting & Railway Company have absorbed the Westport Electric Lighting Company and the Westport Water Company. It is understood that the stock sold at par and the bonds at a premium.

The recent advance in General Electric stock to \$200 per share has naturally resulted in the exchange of stock for the 5 per cent. debenture bonds, says the Boston "News Bureau." To date about \$3,600,000 bonds have been surrendered, leaving \$1,700,000 outstanding.

A stockholders' meeting of the Cincinnati Street Railway has been called for February 21, to vote on a lease to the Widener-Elkins syndicate. A proposition will be made to guarantee to stockholders annual dividends of 5½ per cent. the first year, 5¼ the second, 5¼ the third and 6 per cent. yearly thereafter.

The Chicago Telephone Company reports for the year ended December 31: Gross earnings, \$3,129,238; operating expenses, \$2,258,781; net earnings, \$870,457. During the year the company issued \$2,000,000 new stock. It will issue the same amount this year, bringing the total capital up to \$9,000,000. The additional capital will be offered to stockholders at par.

At the directors' meeting of the Erie Telegraph & Telephone Company on January 17, President Glidden's resignation was accepted. He remains in the company as general manager. A new executive committee was elected as follows: Philip Dexter, Wm. Endicott, Jr., Reginald Foster, Francis R. Hart, W. De Latta. Walter Abbott, was elected treasurer, vice Chas. A. Grant, who resigned.

At the annual meeting of the Toronto Electric Street Railway Company, on the 16th inst., it was reported that the gross earnings for the past year were \$1,501,000, as compared with \$1,333,542 the previous year. The operating expenses were \$775,980, or 51 per cent. of the gross, as compared with \$650,324, or 48.8 per cent. of the gross in 1899. After paying all fixed charges, there remained a net profit of \$454,102, from which dividends of \$240,000 or 4 per cent. on the capital were paid. The city pavement charges were met and \$150,162 put to the credit of the profit and loss account. Since 1892, the company has spent over \$1,000,000 of the surplus earnings on improvements to the property. The increase in the price of coal and advances in the wages of employees were the causes of the increase in the operating expenses last year.

Figures of copper production and our exports of the metal for the year 1900 are now complete. The domestic output of copper as well as the shipments abroad were the largest on record. The figures are notable as showing an abnormally small increase in the domestic production—2.5 per cent., which compares with a 10 per cent. normal increase—and an abnormally large increase in the exports to foreign countries—33.2 per cent. There was consumed in the United States but 40 per cent. of the amount of copper produced here, the remaining 60 per cent. having been shipped abroad. For the closing months of the year, November and December, our exports of copper show a material falling off from the figures for the same months in 1899. The exports for these two months in 1900 amounted to 20,731 tons against 26,359 for the same months in 1899. Another important fact to be noted is that the European production for December at 8,483 tons was the largest for any one month in the history of the industry.

EDITORIAL NOTES.

The Effect of the Atmosphere on Aluminum Conductors.

The use of aluminum wire for carrying electric currents is becoming more and more general in spite of the fact that it cannot be so easily joined together or soldered as copper. The Niagara Falls Power Company has about completed an aluminum transmission line between Niagara Falls and Buffalo consisting of thirty-seven strands of 300,000 circular mils, which will carry current at a pressure of 22,000 volts. Aluminum transmission lines have also been adopted by the Hartford Electric Light & Power Company, the Snoqualmie Falls Power Company, the Blue Lakes Power Company and others. All of these lines are many miles in length, that of the Blue Lakes Company extending a distance of thirty-six miles.

After referring to these facts, Mr. John B. C. Kershaw, in a paper read before the Institution of Electrical Engineers on January 11, states that, although many miles of bare aluminum conductors have been strung, no systematic efforts have apparently been made to ascertain the effects upon them of exposure to the weather. The author says:

"The old idea that aluminum was absolutely proof against attack by all agents excepting alkalis and hydrochloric acid is now known to be incorrect; and Ditte in communications made to the Academie des Sciences has shown that aluminum is easily attacked and corroded by air and water under certain conditions. It is therefore of considerable importance to inquire whether these conditions are present when aluminum is used as a bare conductor for overhead lines and is exposed to all the varieties of weather that we experience in the course of the four seasons of the year. In America electrical engineers are conducting this inquiry in the usual American fashion, and their installations of aluminum for transmission lines in California and other places are in reality large scale experiments which, if unsuccessful, will cause heavy losses to fall upon those who have been financing these undertakings."

Mr. Kershaw then goes on to state that with a view to solving this important question he has carried on two sets of experiments in the North of England since the fall of 1899. The samples of aluminum used were in rod and

wire form, cut into two-foot lengths. These were mounted upon glass insulators in two frames, on which were also mounted samples of copper wire and galvanized iron wire. These frames were then exposed to the weather for ten months without being moved—the wires on them however first being carefully weighed and tested for conductivity and tensile strength.

On making a surface examination at the end of the period mentioned it was found that the aluminum wire was pitted on the under side where water drops had collected and dried. There was apparently no change in the galvanized iron wire while the copper wire was oxidized on the surface, but was not pitted. The aluminum samples, it was discovered on placing them on a balance, had gained in weight from nil up to .83 per cent. on the original wire after being thoroughly scrubbed. It was also ascertained that there was a considerable loss in conductivity and tensile strength, due to the exposure and pitting. The galvanized iron samples had also lost in weight, while the copper wire showed no change whatsoever.

The author concludes that the results obtained cannot be looked upon as final in view of the fact that the atmosphere and elements that go to make it up differ in different localities, and he wisely suggests that experiments be carried on in a number of cities at the same time. In his opinion, however, where a town burns a large amount of coal the atmosphere will be impregnated with impurities that cannot help but affect aluminum conductors. Commenting on this fact he states that "under such conditions all metals used for overhead conductors are subject to attack, and aluminum is unsuitable for use, owing to the pitting which occurs. In such towns it is advisable to use copper for all overhead wires, and the proposal to use aluminum, especially for overhead trolley lines, must be condemned."

"In country districts or in small towns, where the impurities in the air are reduced to a minimum, all metals experimented with seem to be fairly durable, but the slight pitting of aluminum which occurs—even in such an atmosphere—may prove serious: for by allowing the lodgment of small particles of foreign matter it may in time lead to the disintegration of the whole mass of metal."

The results obtained and the conclusions arrived at by Mr. Kershaw are well worthy of attention, and the experiments carried out by him might with advantage be duplicated in

this country now that so many thousands of dollars are being invested in aluminum conductors.

* * *

Compressed Air Cars.

Considerable matter has appeared from time to time in these columns on the subject of compressed air cars for street railway service. Inventors have been at work on this subject for years, yet it is only comparatively recently that a type of motor has been brought out that gave any kind of satisfaction. As is generally known the Metropolitan Street Railway Company, with a view of obviating the necessity of building a conduit system which meant the expenditure of a very large sum of money, has for some time been experimenting with compressed air cars on its Twenty-eighth and Twenty-ninth street cross-town line. In a recent issue of our contemporary "Compressed Air" there appears a very interesting article on this subject, including a table giving the number of cars operated, cost of repairs, cost of operating and many other things of importance.

Our contemporary—as in duty bound—naturally considers compressed air cars the solution of the problem of street railway transportation, and points out among other things that although the expense of operating a compressed air car comes to 17.42 cents per car mile, this figure could be considerably reduced were more cars in operation, as the capacity of the compressor at the charging station is much greater than is necessary for the number of cars now in use.

The cost of operating horse cars in this city is 18.98 cents per car mile, the cost of drawing cable cars 17.76 cents, and the figures given for electrically propelled cars are 13.16 cents. From this it will be seen that it now costs almost as much to run a compressed air car a mile as it does a cable car, yet the cable has been or is being done away with all over the city on account of this very expense of operating. Our contemporary thinks that when "the conditions are all correctly adapted to the work" the cost of operating a compressed air car per mile can be reduced to 13.57 cents, which even then would be slightly more than the cost of operating an electric car. But this reduction in cost is as yet only surmise, and the fact remains that compressed air cars entail an expense of 4.26 cents more per car mile than electric cars, which saving in a year on the total number of car miles on the Twenty-eighth and Twenty-ninth street line would be sufficient to pay 5 per cent. interest on a sum that would permit of the building of an electric conduit road. And that is what the New York traveling public requires, as the compressed air cars puff, snort and wobble like locomotives, to say nothing of the long trail of grease and dirt which they leave in their wake.

* * *

Coal Dust as Fuel for Steam Boilers.

Experiments looking to the utilization of coal dust as fuel have been made from time to time with encouraging results. In a recent issue of a foreign publication some tests made in Switzerland are described which are quite interesting. The first experiments made in that country on the use of coal dust as fuel for steam boilers were carried out in 1896 by Mr. Gressly, at the Berne Small Arms Factory, under the superintendence of the Swiss Society of Boiler-owners. The boiler used was that of the Sul-

zer-Cornish form, and the Mehl grate and Wegener system of firing were both tried. The results appeared in the 1896 report of the society, and showed that the dust could be burnt smokelessly with a thermal efficiency of 20.93 per cent., and a saving in cost of steam of 15.5 per cent. Subsequently, at the Gelafingen Iron Works, a Lancashire type of boiler was fitted up for coal-dust burning, and since the spring of 1897 Messrs. Sulzer have given the subject great attention. In Basle the Warteck Brewery took up the subject, and used the Wegener apparatus and comparative tests were made with this and the Cario system of firing, and proved favorable to the former. At the Polytechnic, at Zurich, the Wegener system was used for a time in an old boiler, but was given up, as it was feared the excessive heat produced would injure the furnaces. The author points out that the boilers require to be specially adapted for dust burning. For successful results the dust may be in the form of very fine powder. A table is given in the original of the results obtained at the cement works at Ehingen as compared with firing in a Ten-Brink furnace, and the costs of the former appear very favorable, as the dust firing enabled a very cheap kind of coal to be used. It appears, however, that the coal-dust firing has been subsequently given up, not, however, owing to inherent defects in the system, but because the excessive heat produced by the dust was localized so much that it caused damage to the furnaces of the Ten-Brink boilers, which had not been specially designed for the use of dust, but merely temporarily altered for the purpose. The author considers that the process is well worth attention, with the special kinds of coal which produce a great deal of slack.

That such is the case there is not the slightest doubt, for there are thousands of horse power of electrical energy stored in coal dust heaps throughout the country that in the past have not been considered worth the carting.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

PROF. LUCIEN V. BLAKE, head of the electrical department of the University of Kansas, has been experimenting for some time on an electrical process by which precious metals may be obtained from ore cheaper than by any process now in use. The details of the invention are not given, but it is stated that the method has proven satisfactory in an experimental way and will shortly be given a trial on a practical scale by a prominent smelting concern.

DR. A. E. KENNELLY will lecture on solar eclipses before the Franklin Institute, Philadelphia, on Friday evening.

A FRENCH electrician has just brought out a system of wireless telephony which is said to have been tried successfully at Saint Germain over a distance of 1,000 meters. The details of the invention are not given.

PROVISION has been made by the Appropriations Committee of the House of Representatives in Washington for the purchase and installation of searchlights at strategic points on the shores of New York Harbor, as a part of the system of defence. An appropriation of

\$150,000 for this purpose is included in the Fortifications bill reported by the committee recently. These lights, according to army engineers, will be placed at Fort Hamilton and other points, and will enable the operators to flood with light the new channel now being dredged in case an enemy should attempt to enter.

A REPORT from Pretoria, South Africa, states that eighty Boers raided Brak Pan one morning last week. They put a guard over the employees of the electric power works while they damaged the dynamo and other machinery. The works belong to a German company and supply the suburbs of Johannesburg and the mines with light and power.

THE Central Cable Office announces that the Great Northern Company and the Eastern Extension Company have constructed land lines between Pekin, Tientsin and Taku in connection with the neutral cables established last year between Taku, Chefoo and Shanghai. The stations at Pekin and Tientsin were opened last week.

A FRENCH military engineer by the name of Lanette suggests reaching the North Pole by means of an ice tunnel which would be lighted throughout by electricity.

MR. F. A. WUNDER, who has been connected with the Siemens & Halske Electric Company of America, will open an office on February 1 at 95-97 Liberty street, New York, as general sales agent of the Ball Electric Company of New York City.

THE basin of the fountains, which stretches in front of the Electric Tower at the Pan-American Exposition at Buffalo, is already imposing in its appearance, although it is by no means finished. Here in this basin, as on the tower, advantage will again be taken of the enormous amount of electrical energy which is at the command of the managers and designers of the Exposition. Moving electrical pictures will be thrown upon the surface of the lake as they will be thrown upon the facade of the tower. The plan for the basin is a series of combats between red imps and vari-colored goblins. Their struggles will be furious, but the imps will win, and slowly drown the goblins. This will be accomplished by an entirely new electric device. These plans, so wonderful in themselves, are being constantly augmented day by day. The fact of an unlimited and comparatively inexpensive supply of electricity has bent the energies of many inventors toward devising new features of this kind of display.

In a report to the State Department at Washington on the competition of electric vehicles in Berlin, Consul Hughes, at Coburg, says that the battery taking the first honors weighed only 121 pounds a kilowatt hour, while the heaviest weighed 286 pounds a kilowatt hour. The average weight of the 13 vehicles participating in the competition was 165 pounds. The smallest consumption of energy a ton mile at the mean speed amounted to 91 watt hours for a passenger car, a performance which surpassed all previous records. However in nearly all the cases the demand did not vary greatly with the speed, which leads to the conclusion that the electrically propelled vehicle should be driven at the highest speed consistent with public safety in order to ob-

tain the greatest commercial economy of energy. With regard to the motor best adapted for the weight to be propelled the capacity should amount approximately to one kilowatt to each ton of the rolling weight.

A new electrical machine has been invented by which, it is claimed, ice can be made in houses or apartments at much less cost than it can be furnished by any company. The machine is operated by a one-horse-power motor, which is declared to be capable of producing 1,200 pounds of ice in twenty-four hours, at a cost to the consumer of about \$1. It is also declared by the electric company which is using the machine that a small refrigerating machine on the same principle can be installed in any refrigerator which will maintain an absolutely even temperature for a whole season, and that it will also produce small pieces of ice for an ice-pitcher, and may be used for freezing cream. In Hartford, Conn., the electric light company intends to lease the machines to householders, and charge them only for the current used in them. The new machine uses anhydrous ammonia, and its expansion is regulated by a small electric motor, which goes about its work automatically, and requires no more attention than the usual oiling.

DOUBTLESS everyone who has ridden on any of the under-running trolley cars in New York City has noticed the uncomfortable jerk and jar which usually occurs when the motorman starts the car. This annoyance is frequently as great and often greater than that caused by the sudden starting of a cable car. So many complaints have been heard from the traveling public regarding this matter, that electric railway engineers are devoting considerable attention to it. The principal cause of the sudden jar on starting a trolley car lies in the fact that the controller through which the current passes from the contact rail to the motors is not supplied with a sufficient number of graduations, so that current may be more gently applied to the motors. It is a very simple matter to design and manufacture a proper controller, but the chief difficulty in the way of its adoption by electric railway companies is its very much increased cost over the type now in use.

THE question of fatigue caused to the eyes by various kinds of artificial lights has recently been taken up and studied at some length by a Russian Government expert. He says that the involuntary closing of the eye—winking—is a sign of weariness. Using surfaces illuminated by various lights he counted the involuntary movements of the eyelid, his results being that when candlelight was used the eyes were closed 6.8 times a minute; with gaslight, winking occurred 2.8 times a minute; with sunlight, the eyes closed 2.2 times, and with electric light 1.8 times. From these facts he draws the conclusion, which seems to be corroborated by other observations, that the electric light is the least injurious to the eyesight of all varieties of artificial illuminants. Whether his relative figures of eye fatigue are of value or not, they are, at least, interesting and probably represent a fair approximation to the facts.

THE officers of museums have to take extraordinary precautions to protect the treasures committed to their care. Canes and umbrellas, as is well known, are taken away from the

visitors at the doors. In one museum of national reputation there is a large staff of attendants constantly patrolling through the different rooms, and even at night watchmen are regularly making their rounds, as much to watch for possible burglars as to give the alarm in case of fire. Beyond this there is a burglar-alarm system elaborated so as to protect all the rooms and the cases in each room. In one room the Greek ornaments of gold are estimated to be worth \$500,000. This is naturally a great temptation to crooks, who are well aware of the location of the room and the value of its contents. But any thief who undertook to ply his calling in this particular room would run a very good chance of rueing his enterprise. There is only one entrance to the room, which is guarded constantly by two men. But what makes the room absolutely thief-proof is its electrical equipment. The room is literally threaded throughout with electric wires. Under each article in the cases, even though it be only a small ring, there is a tiny wire, invisible to the casual observer—and the presence of which would never be suspected by the uninitiated. This wire connects with the office of the director of the museum, several rooms distant. If an article is touched or disturbed the alarm immediately rings in his office, and the door of the room is at once closed. So that if the thief happened to be within he would be safely caught in a trap.

JUDGE HENRY, of the Circuit Court at Kansas City, has handed down a case of national importance, when he, in a written opinion, decided that the State of Missouri, represented by the State Board of Equalization, had no right to tax the franchise of the Western Union Telegraph Company.

How metals gather into the veins in which miners find them is not well understood in some cases, but electricians are now proposing to use electricity to do the work of concentrating. In some copper mines, for example, the richer bodies of ore have been taken out and the remaining copper is scattered in small particles through the rock. The rock is too "poor" to work at a profit in the ordinary way. But by flooding the mine with water, adding acid, if necessary, inserting widely separated electrodes and turning on the current of a powerful dynamo, it is possible, it is thought, to cause the copper scattered through lean rock to gather where it can be gotten at. Copper will be deposited on the electrode in proportion to the amount of electrical energy supplied. After a year or two the mine may be pumped out so that the electrode may be reached and its deposit of metal may be extracted. Lean deposits, especially if in the neighborhood of water powers, may be thus worked to great advantage, since the resulting metallic deposits will be pure and will require no further treatment.

At a recent meeting of the Vienna Society of Physicians, Dr. Schiff and Dr. Freund reported an interesting action of high-tension currents on the skin, which appears in the "Lancet." According to the authors, when the hairy skin is exposed for twenty minutes to the silent discharge of the negative pole of a powerful Ruhmkorff coil, such as is used for the production of the Roentgen rays, the hairs commence to fall out, the hair-bulbs become

atrophied after the third exposure, and some days later the portion of the skin which had been exposed becomes perfectly bald. The hair follicles become red and inflamed after the first two exposures. These observations seem to prove that depilation can be produced by the action of high-tension currents, and that the depilatory effect of exposure to the Roentgen rays may be accounted for in this way.

ACCORDING to "L'Industrie Electrique," Paris, a scheme for electrical transmission on a large scale is suggested in connection with the town of Roanne, in France. It is proposed to obtain the necessary power from the River Loire by the construction of a canal parallel to the course of the river, over a distance of about 7½ miles. The fall in this section of the river is so great, that by the construction of the canal an available head of 135 feet would be obtained even when the river was low. It is estimated that sufficient water could be taken from the river to generate 100,000 hp.

THE continued preference of engineers and users for direct-coupled generating sets has practically driven the manufacturers of leather and rubber belting from the electrical field. In fact, the question of a thorough understanding between the builders of steam engines which are to be direct-coupled to generators and the manufacturers of the generator has come to be of such importance that it formed the subject of an address recently delivered by H. C. Ebert before the Engine Builders' Association of the United States. The author of the address discussed the question at great length from the standpoint that the engine and generator specifications must be analogous in so far as capacity, speed and regulation are concerned. He also argued that there should be uniformity in rating engines in regard to the overload capacity of the generator to be driven by it.

A MECHANICAL expert of Hamilton, O., has invented an electrical process for developing steam in boilers. By the device water is projected in the form of a dense spray on electrically heated flues, thus generating steam instantly. The electricity is provided by a dynamo, which is in turn to be operated by the excess steam of the boiler. The only power required outside this compensating process is the initial force needed to start the dynamo and run it long enough to get up steam. This will be furnished by a small gasoline engine and a pint of fuel. A company has lately been organized to develop the invention. It is composed entirely of practical mechanical men and they are all confident of success.

A RECENT cable dispatch from London states that it was generally believed that an American firm would secure the contract for equipping the old underground system of London with electric traction. The American bidders were the lowest except Ganz & Company of Budapest. The bid of this company was not only much below that of all others, but it proposes an entirely new system, for which it claims great novelty. The directors deferred the awarding of the contract. They will send a committee of experts to Budapest to investigate. Particulars of the proposed system are not yet obtainable.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 12.

A TALK TO WIREMEN.

To be a wireman is to be in possession of a trade that is equally as hard to acquire, is just as intricate and takes as long to master as any trade we might mention, in fact we can think of no trade that requires the constant application of the workman to it, to keep himself up-to-date and on a par with the continually improving apparatus and systems, as that of the wireman; yet how abused the term is. How often have we seen a man pose as a wireman who has probably been employed for a few months only at the line of work, and then it may be at only one particular branch, such as the installation of a system in a large building. He is also just as liable to use the term electrician in designating his profession.

The electrical industry has at this age assumed such proportions and covers such a vast area of the industrial world that it is practically impossible for a man to master all the branches or even very many of them, and we find the most proficient tradesmen to be those who have directed their attention to a particular branch. We also find the most successful men employed in the electrical industry to be those who have applied their attention and labors to mastering the art of one particular line; however all the branches may and do have considerable that is common, and that constitutes a general knowledge of the electrical science, its laws and governing influences.

The wiremen comprise a large majority of the men employed in electrical work to-day, and to them I will particularly direct this article and endeavor to give an outline of what a man must familiarize himself with and master before he can unhesitatingly go before the world saying he is a wireman, and at the same time place before the trade's fraternity a standard for this branch of the electrical industry.

There is nothing that will keep down the price paid for a certain branch of industry like a low standard of efficiency recognized by that branch as constituting a tradesman.

The term electrician applied to a wireman is wrong although it may be a higher sounding title. A wireman is no more an electrician than a carpenter is an architect. Because a carpenter can construct a picket fence in front of your house is no indication that he is an architect, and because a wireman can design, wire for and install an electric bell does not assert that he is an electrician; but because a carpenter is not an architect does not make him any the less valuable as a carpenter, or because a wireman is not an electrician does not deteriorate his value as a wireman. The two are separate and distinct classifications.

Generally speaking there is no tradesman who is placed as much on his own responsibility as a wireman or who is continually being placed in positions where he must rely entirely upon his own good judgment. So also there are probably no other trades that admit of the

same opportunity for slighting the work without fear of detection. If a workman does open work, then an examination will demonstrate his ability, but in concealed or conduit work a great deal of dependence must necessarily be placed on the wireman.

Quite recently I had a conversation with an official of the inspection bureau of the Fire Underwriters' Association of one of our large cities and he informed me that there are more poor wiremen caused by incompetent and unreliable companies and are a direct result of competition in prices that are caused by the individual negligence of the men. He further stated that often when he had occasion to draw a wireman's attention to unworkmanlike work he would be answered to the effect that it was a "slide" job, which probably meant that the unreliable contracting company had taken the contract at a very low figure to outbid their competitors. In a case like this the company is irresponsible and the workman soon becomes the same if not cautious.

A few days ago I talked with a prominent engineer, a gentleman who has probably supervised the wiring and installation of electrical plants in as many large buildings as any other engineer in this country, and I told him I was going to talk to wiremen through the columns of *ELECTRICITY* and would like to quote his opinion on the wireman of to-day, and he said: "Say, Eaton, tell them there was never the demand for good wiremen that there is to-day, and if they do not get as high a rate of wages generally as other trades it is because they have no standard for a tradesman. When I come across a thorough wireman I have to pay the price to get him and he is not out looking for employment either."

A wireman must naturally be a mechanic, he must be in possession of good mechanical ideas and be familiar with, in a general way, all building trades. It is essential that he understand the general construction of buildings. For example, if we send two men to do similar work on a building and electrically they are of equal ability but one understands the general construction of buildings and the other does not, you will readily see the difference in the quality of their work. The former will be able to take advantage of so many facilities known to him, that the two pieces of work when completed will have no semblance of similarity.

A wireman must understand Ohm's Law and its application, also have a detailed knowledge of all standard systems of wiring, not only for light and power but also for bells, gas lighting, telephones, etc. He must be familiar with modern circuits and systems of circuits, and also his electrical knowledge must be sufficient to permit him to understand or devise circuits to accomplish desired results.

He should understand the theory and application of all safety devices used in wiring.

He should be able to calculate sizes of wire for distribution, loss and safe carrying capacity, also be able to say what kind of insulation is preferable to use under certain conditions, as for instance in dye houses or chemical laboratories.

He should be able to work from architects' drawings, and be familiar with all signs and terms used by them in these drawings.

Above all things wiremen should be thoroughly familiar with The National Code of Fire Underwriters' Rules. I might state here that it is practically impossible to make a set

of rules that will hold good in and govern all cases. The National Code of Fire Underwriters' Rules do not, but the wireman should be intelligent enough to understand the object governing the rule, and if the conditions do not permit of obeying it his electrical ability should come to his aid in devising a means of accomplishing the result with an equal amount of protection.

Of course in connection with all this it is understood that the wireman has the ability to execute his work in a workmanlike manner, for without this even if he was well versed in all the other points technically he would by no means become a successful workman and command a price for his labor.

Now, to the reader who aspires to becoming a wireman, permit me to say that he individually will create his own value as a tradesman and that value will depend entirely upon his proficiency in the art. Do not be misled by the idea that you are a wireman just because you may be able to put up a piece of moulding work or install a few electric lights. Do not let your ambition rest until you have mastered the art in all its detail, and when you have done this you will have placed upon your labor a value that will make you independent of influence or combinations to secure for you a position and a just and satisfactory compensation for your labor.

Article No. 13 will be entitled "The Three Wire System."

THE TRADE EDUCATION OF CENTRAL STATION EMPLOYEES.*

GENERAL.

The investigations of this committee have shown them that they have a big subject to deal with, and one which is rapidly changing in aspect. This report may be therefore characterized as preliminary, and it is our belief that the committee may be advantageously continued for the purpose of further investigations into the working of correspondence schools of various types with a view to making a more complete comparison of the results obtained by these schools.

For the present the committee has felt that it is desirable to divide the subject and discuss it under three heads:

1. Can correspondence instruction be relied upon to increase the usefulness of electric central station employees to their employers?
2. Are existing courses of the correspondence schools properly adapted to be of the greatest use to electric central station employees and through them to their employers?
3. What provisions may central station owners reasonably supply for the purpose of encouraging their employees to study the requirements of their business and how may those provisions be executed?

Your committee finds that for the purpose of this report only four correspondence schools need be considered, since these are the only ones which present courses for electric central stations at large. These four schools are given in alphabetical order as follows:

The American School of Correspondence, Boston, Mass.

The Electrical Engineer Institute of Correspondence Instruction, New York City.

* Abstract of a report of the Committee of the Northwestern Electrical Association, appointed to consider the advisability of central station managements encouraging their employees to enroll themselves in courses of correspondence schools.

The International Correspondence Schools, Scranton, Pa.

The United Correspondence Schools, New York City.

Each of these schools has an enrollment in all of its courses which aggregates thousands.

One school, the International, advertises an aggregate total enrollment of 200,000, or thereabouts. This aggregate, however, must be understood as representing the total enrollments which the school has enjoyed since its organization, but even thus considered the number is big enough to be amazing. The enrollments of the other schools are smaller than this, but they are in each case large enough to provoke consideration for their work.

The United Correspondence Schools, which is incorporated in New York, has a capital stock of \$250,000. An inspection of the headquarters of this school also makes it evident that a considerable sum is invested in fixed equipment, or is required in handling the business of the school.

The American School of Correspondence is incorporated under the laws of the State of Massachusetts, and the Electrical Engineer Institute of Correspondence Instruction is incorporated under the laws of the State of New York. Neither of the latter two institutions advertises its capital stock, but it appears from an inspection made by your committee that the money invested in these schools is not so extensive as that invested in the others. This must not be understood to be necessarily an unfavorable criticism. Your committee is not prepared to say that the moneys invested in the buildings or equipment in the other schools are essential to the best success of their efforts to teach, though they must be contributory thereto.

In the effort to get information with respect to the correspondence schools, your committee was dependent to a considerable extent upon the schools themselves. The chairman of your committee expended considerable time and some money in interviewing the managers at headquarters of the several schools and making personal examinations of the arrangements for dispatching business. An unfortunate conflict of engagements made it impossible for him to interview the manager of the International Correspondence Schools at Scranton, but he has had correspondence with him and his Western superintendent, and has interviewed the principal of one of the important departments of the school, and also the Western superintendent of the school.

All the schools have courteously responded to requests for information and all of them, with one exception, have given fairly complete information upon points inquired about—two schools have in fact offered more than the committee specifically asked for. The exception is the Electrical Engineer Institute of Correspondence Instruction, which courteously declined to lay bare its methods of business management and the results attained by its school. This refusal was made notwithstanding the fact that the committee only desired and requested the information needed for the purpose of arriving at a just conclusion with respect to the merits of the school.

The United Schools gave full information, but were unwilling to allow correspondence to be carried on with their scholars except through the home office.

FIRST HEAD.

1. Can Correspondence Instruction be Relied

Upon to Increase the Usefulness of Electrical Central Station Employes to Their Employers?

For the purpose of aiding the committee in making its judgment upon this matter we sent out letters to from fifty to seventy-five of the scholars of each of three correspondence schools.

These letters were accompanied by a list of questions which read as follows:

QUESTIONS.

1. What is your employment?
2. What regular schooling have you had?
3. How long have you been enrolled as a scholar in the correspondence school?
4. What course are you taking, and how far along in your course are you now?
5. How much practical advantage have you thus far found from your correspondence school lessons?
6. How far do you feel that you can ultimately increase your value to your employer by taking the instruction in the correspondence school?
7. Do you now intend to complete the full course you have entered upon?
8. How long do you think it will require you to do this?
9. Would it have been impracticable for you to have taken a full course in a manual training school or a high school?
10. Do you anticipate ever preparing to enter a regular engineering course in a college?

One of the schools (the American School of Correspondence) courteously furnished us with a list of about seventy-five of its scholars to whom letters were sent and from whom replies were received—each of the replies being more or less full. Two of the schools (the International and the United Correspondence Schools) preferred to send out the letters for us rather than to give the names and addresses of their scholars, which might perhaps be a violation of the confidential agreement with their scholars. The answers to these letters were then forwarded to the chairman of the committee. One school (the Electrical Engineer Institute of Correspondence Instruction) refused to either furnish a list of names of its scholars or to send out letters of inquiry furnished by the committee for the purpose.

The chairman of your committee received approximately 250 replies from the scholars of the three schools named above. The answers were enthusiastically affirmative regarding the advantages derived from the courses of the schools. This was true to a unit. As the schools each had the opportunity to pick some 50 to 100 scholars, to which the letters were sent, from perhaps some thousands or even tens of thousands, we may very properly credit them with furnishing the addresses or forwarding our request letters to scholars who were recognized as being satisfied. Notwithstanding this advantage on the side of the schools, your committee was surprised at the extreme unanimity with which the courses of the schools are approved by the scholars.

The subject of this division of this report is dealt with from the scholars' point of view in their answers to the fifth and sixth questions. Some thoroughly concrete information might perhaps have been obtained through correspondence with the employers of these various scholars, but your committee did not feel privileged to undertake this without first invoking the permission of the schools and then individually requesting permission from the schol-

ars themselves, since there appears to be some sensitiveness in respect to making known the names of individuals who are enrolled in correspondence school courses.

A properly planned correspondence course may put the fireman upon a proper footing with respect to his handling of the coal. The engine runner, the dynamo tender and the wiper may all likewise be made more efficient through a proper understanding of their business, with a considerable increase resulting in the net earnings of a station. It is particularly important that the chief operating engineer of a station and the superintendent of the company shall be well trained in matters relating to the economical combustion of fuel for the raising of steam, the economical operation of steam engines and auxiliaries, as well as the economical handling of electric machinery and devices, and that they shall be competent to properly instruct all of the station employes.

The central station company, whose superintendent and chief operating engineer are not acquainted with methods of analyzing flue gases, testing the quality of steam, the use of the indicator for the purpose of checking the valve setting of the engines, and various other special tests about the station, loses through the chimney, through radiation, defective engine-running, and other defects, large sums of money every year. Sums which are lost by many stations on account of the defective knowledge of the employes would, in fact, if saved, be sufficient to pay for the entire cost of correspondence courses for the more important men in the station and still leave a handsome margin over.

That advantages may be gained through a proper training of the employes is shown through the experience of many central stations, and it is also illustrated by the answers which your committee has received to its various letters of inquiry from the employes themselves. We may set it down as a fact that the average central station may in large measure improve its economy as the result of the proper trade education of its employes.

SECOND HEAD.

2. Are Existing Courses of the Correspondence Schools Properly Adapted to be of the Greatest Use to Electric Central Station Employes and through them to their Employers?

Each of the four schools referred to in the earlier part of this report describes one or more courses which are apparently intended for the training of electrical artisans. These courses are called by various names, and are held out by the schools as having value for central station employes. It is readily understood that the value of these courses to such employes must depend upon the subjects treated in them and upon the way in which those subjects are treated. The subjects treated in the various courses which the several schools claim are adapted to the needs of central station employes are set down in the advertising matter of the schools.

Your committee does not believe that any of these courses are adapted to give the greatest returns to central station employes and their employers. We hold the highest appreciation of general education and heartily believe in its great usefulness, but the need of the central station employe can only be met by a course that makes immediate contact with his daily work and continues in that contact through

every lesson sheet, while it teaches him to keep in continual view the best methods for executing his work. In other words, the need is for trade instruction, rather than for broad education. Such a course in its most elementary form might be readily completed by an industrious man of good caliber, who used his spare hours for study (say four to six hours per week), in eighteen months to two years. The existing courses of correspondence schools which are recommended to central station employes vary in length. Some are as short as need be desired, while others are several times as long. None of them contains the essential element of immediately useful and practical information.

The various schools frankly admit that they have prepared no course that fulfills the requirements held out by your committee, but they severally recommend from amongst their courses those just outlined, as most nearly touching the requirements. The time required for the industrious man to complete them by study in spare hours is estimated and set down below:

American School—"Electrical Engineering Course." Time, one and one-half to two years.

Electrical Engineer Institute—"Course No. 13" (in electric lighting and central station practice) or "Junior Course." Time, two and one-half to three years.

International Schools—"Electric Power and Lighting Course." Time, one and one-half to two years.

United Schools—"Complete Station Engineering Course." Time, two years.

ADMINISTRATION OF THEIR COURSES BY THE SEVERAL SCHOOLS.

The methods of administering the courses by the several schools do not essentially differ. The processes are more or less familiar to the members of this Association. Two of the schools employ active solicitors for enrolling scholars, and one of these has a remarkably complete organization. The other two schools claim to solicit solely by advertisements and correspondence, but they pay commission for enrollments brought to them.

There is also a market similarity between the methods of the several schools in treating the candidate after he is enrolled. Each supplies the scholar with printed "instruction papers" or lessons which are put out in pamphlet or book form, and expects him to study the lessons, inquire by letter when unable to surmount difficulties, and finally return answers to a set of "examination questions" on the subject matter of each lesson. Each "examination paper" returned from the scholar is carefully read by clerks at the principal office, is corrected and graded, and is then returned to the scholar with any pertinent comments. The process extends to the drawings as well as to written matter.

CHARACTER OF INSTRUCTION PAPERS.

The question of the character of instruction papers, whether in sheet, pamphlet or book form, of the several schools arises for consideration. To its consideration your committee has applied itself with great interest and diligence. Each of the schools supplied the committee with a set of its lessons covering an entire selected course, or with a partial set which is presumed to contain typical lessons. These instruction papers or lesson sheets are made up in fine form, and in the case of one school are supplied to the scholars as several large vol-

umes bound in half leather. The lessons are the foundation of the entire system of each school, and the importance of their place is testified to by the care that has evidently been given by the schools in perfecting them.

The lessons that have been supplied to the committee for its examination may be divided into three classes—

1. Instruction papers adapted to give an elementary but reasonably practical view of applied electricity to clerks and others who do not have an intimate knowledge of and contact with machinery.

2. Instruction papers adapted to instruct apprentices and artisans in the important features relating to their daily employment.

3. Instruction papers which are more advanced than the latter, being adapted to the grade of information which may be presumed to be possessed by superintendents, foremen, and others, and which verge upon professional engineering.

Your committee will discuss the lesson sheets of each of the schools on the basis of this classification.

The American School of Correspondence furnished to your committee a complete set of the instruction papers relating to the "Electrical Engineering Course," with the exception of six optional papers in mechanical drawing. This is the course which they recommend as adapted to central station employes. It includes twenty-nine separate pamphlets. The instruction papers appear to be accurate and reasonably well written. The course appears to your committee to belong to the first class, and to be more distinctively adapted to office clerks and others who do not get contact with the machinery, than to the instruction of firemen, dynamo tenders, floor engineers, linemen and others who are well acquainted with the general processes, but for whom it is desired to obtain instruction that will result in economies in station operation.

The Electrical Engineer Institute of Correspondence Instruction recommends either its "Junior Course" or its "Course 13." The lessons of each of these courses are contained in some forty or fifty pamphlets that are sent out to the individual scholars. These courses appear to your committee to belong to the third category. They appear to be accurate and logical and to be adapted for the instruction of superintendents, foremen and others who may be assumed to be men well informed in the general details of their business.

The volumes of the International Correspondence Schools which relate to the "Electrical Engineering Course" and its off-shoots seem to be admirably adapted to the comprehension of central station employes, and they are recommended by the school for the instruction of such employes. They belong essentially to the second category. The papers are well written and appear to be accurate.

The instruction papers relating to the electrical courses of the United Correspondence Schools appear to be intermediate between the first and second categories, but they are sufficiently inaccurate to be rendered valueless. This inaccuracy is particularly surprising, since the "Mining Engineering Course" of this school has been supervised by a number of eminent specialists, and your committee, therefore, hoped to find a thorough appreciation of accuracy in the work of the school. Your committee informed the presi-

dent of this school that the instruction papers contained inaccuracies, and was immediately assured by him that the school desired to make its instruction as perfect as possible and that it would make every effort to eliminate all errors.

[The balance of the report with discussion will appear in our next issue.—ED.]

CARE OF BOILERS.

Whatever plan is adopted for securing water to feed the boilers should not interfere with the general plan of feeding at the same rate that the steam is used, so that the water line will remain nearly in the same place at all times. In every plant where there are two or more boilers, it is sometimes necessary to lay off one of them for cleaning or repairs. In fact every plant should have an extra boiler to use in case of necessity, and this means whenever it is advisable to clean one of them, as the practice of running boilers almost continuously should be discountenanced on all convenient occasions. The plan of leaving boilers empty is a good one, provided steam and water are excluded from them. This opinion is based on experience in starting up a boiler that had not been used for fourteen years, for no internal corrosion was found in it, while the external parts were but slightly affected by its long rest. It was set in brick according to common practice, two walls of the building serving as a part of setting. After it had been thoroughly inspected it was run for several years under as much pressure as a new boiler of equal diameter is usually allowed without calling for repairs except tightening two braces, and probably this was needed before it was laid off. When boilers are to be left idle for a long time they should be thoroughly cleaned, as soot collects and holds moisture, so that corrosion goes on underneath the apparently harmless covering until the plates are ruined. A coat of good paint suitable for ironwork will assist greatly in preserving the boilers out of use, and as the expense of it is small, it does not pay to neglect it, for good second-hand boilers are frequently wanted by parties who do not care to invest in new ones for reasons of their own; but when corrosion is allowed to eat into the tubes and plates they will soon be fit for the scrap heap only, and are not especially valuable even there. One advantage of a power pump and a driven well in connection with a good heater is that all of the pumping must be done before the engine is shut down, which means that exhaust steam is passing through the heater, and no cold water can reach the boiler. An injector, says the "Boilermaker," is very convenient in such a plant, because it may be run to fill up the boiler after the engine is shut down.

Motor and Cycle Show in Paris.

The Grand Palais, one of the few prominent buildings of the Paris Exposition, and the structure in which the art exhibits, including the United States section, were located, was reopened on the 25th inst. with an automobile and cycle show. The vast glass-roofed edifice lends itself admirably to the purpose of an exhibition hall, to which it is now devoted. A large and fashionable assemblage attended the opening. Several American firms are represented among the exhibitors.

A PERPETUAL MOVEMENT CLOCK.

Translated for *ELECTRICITY* from "La Vie Scientifique,"
Paris, France.

The Paris Exposition contained a very curious exhibit in the form of a clock which attracted much attention from visitors. It was placed in a glass case to protect its delicate working parts from meddlers. It was self-moving and it ran two months during the Exposition without stopping and without having been wound up by any outside force surreptitiously. There was no reason why it should have stopped for it was a true form of perpetual movement—within the limits however of the wearing out of its mechanism.

Its inventor was enabled to obtain these results by very ingeniously combining a system of levers, or hinged residual magnetic arma-

There are two circles composed of levers which are placed on the two side faces of the rim of a large wheel. These two sets of levers form an angle of 45 degrees with each other and at their outer ends counterweights are attached to the longer arm of each lever. From the start we conclude that the counterweights on the side farthest from the center of the wheel would give a preponderating turning force to the wheel, causing it to turn with a circular movement.

The cut shows the wheel in motion. It makes 4 turns per minute and its movement is regulated by a centrifugal governor put in motion through an endless chain.

The framework of the apparatus is of magnetized steel and supports the axle of the wheel and it is surmounted by a roller which forms one of the magnetic poles.

lever following, and without interruption for each of the 26 levers which make up each circle.

The motion of the wheel is transmitted to the clock spring through a pinion placed on the axle which meshes into a toothed wheel, which at its center has an endless screw acting on another smaller wheel, whose axial pinion rests on the wheel of the drum which winds up the spring.

This spring is rigidly held only by its central portion. The other extremity remains free and slides on the inner surface of its containing barrel. The purpose of this construction is to maintain a constant and equal tension in the spring, which the motor tends to increase in quite an irregular manner. By means of this construction the spring is kept wound up continuously and always with the same tension.

The inventor claims the apparatus to be only in an embryonic condition, and that it forms a new kind of a motor which may bring about a new era in clock-making particularly, and in mechanism in general.

To make this machine entirely automatic, it is only necessary at the start to magnetize to the saturation point once for all the tempered steel framework of the motor, whose consequent poles are used for acting on the various armatures.

LEON PALIS' PERPETUAL MOVEMENT CLOCK.

tures, which moved a wheel continuously around its axis for the purpose of winding up a spring, consequently the clock was only an accessory, for the apparatus could be used for other purposes and the construction of the wheel or moving mechanism alone contains the interesting features of the invention.

To explain this movement the inventor, M. Léon Palis, furnished the photograph from which our illustration is taken.

The basic principle of construction is the well known law in electrical physics that two magnetic poles of the same sign repel each other, while poles of opposite signs attract. In this case the magnetic effects are wholly repulsive and they could not be otherwise, for magnetic attractive force derived from permanent magnets is essentially a cohesive force which requires an equal separative force.

When the wheel in its movement brings the short arm of one of the levers, which may be called an armature, to the face of the pulley the phenomenon of magnetic repulsion takes place, which causes the long arm of the lever with the counterweight to rise to a vertical position, while the further motion of the wheel causes it to fall to the other side from the vertical position, and thus making it add its weight to each of the others which have preceded it to keep the wheel in motion.

We should notice here that from the moment the counterweight commences to raise, up to the time it attains a vertical position, its weight is null, because the repulsive magnetic force performs the same office that a jet of air or steam would, and maintains it in a state of equilibrium.

The same result takes place with the next

THE VICARINO SYSTEM OF TRAIN LIGHTING.*

Whether or not the problem of train lighting has been satisfactorily solved is perhaps an open question, but if the results claimed for the Vicarino system can be borne out in practice, it is certain that at least one other satisfactory system will have been added to those already tried.

There can be no doubt that, in principle, the electric light has many advantages over gas or oil. The questions of first cost and cost of maintenance, however, weigh more in the balance with railway directors than such incidental advantages as passengers' comfort, and this is not unreasonable since a railway company is formed for the purpose of transporting—*inter alia*—passengers from one point to another, and the contract ends when the passenger has been duly transported. A story is told of a director of a certain railway company who drummed for some minutes at the pigeon hole of a booking office before the clerk condescended to approach him and ask what he was waiting for. The director's reply was more forcible than polite, but when translated into parliamentary language ran somewhat to the effect that he was "waiting" to let the clerk know that he was a director of the line, and that the clerk would subsequently find out what that meant. "Good heavens," begged the clerk, "you must forgive me, sir, I thought you were only a passenger."

From the manner in which trains are usually lighted it may reasonably be inferred that the same principle obtains on most railways.

Assuming, however, that electricity is one of the best, if not the best way of lighting a train, it is clear that the system adopted should be based upon the following fundamental principles.

1. Apparatus employed should be simple and not liable to get out of order.
2. Weight should be as small as possible.

*From the "Electrical Review," London.

3. First cost of installation should be small.
4. Cost of production and maintenance should be at least as small as that of gas or oil.
5. Carriages should be capable of being run on other companies' lines.

Condition (5) is an important one, as the through traffic of a railway may reach a high percentage of its total traffic. This condition is manifestly complied with by an installation of accumulators on each carriage. Accumulator lighting, however, involves a charging station, and as it would not be easy to arrange for each carriage to carry a sufficient storage to enable it to return to its starting point before requiring a fresh charge, it would be necessary to erect charging stations along the line. This not only means expense, but delay, and this is a serious question on a railway.

Without entering into an inquiry as to the relative merits of the various system of lighting trains by electricity, which, moreover, are probably well-known to most of our readers, it may be well to consider shortly the salient features of the Vicarino system, which in its leading characteristics resembles the Stone system.

Mr. C. Vicarino uses an axle driven dynamo fitted with an ingenious arrangement of brush-holders, whereby the direction of motion of carriage is rendered immaterial. This dynamo supplies light to the carriage lamps in connection with a small battery of accumulators. An auxiliary apparatus cuts the accumulator in and out at the proper moment, and is also arranged to equalize the voltage so that the pressure at the lamps does not vary very much.

The dynamo, moreover, is compound wound, the series winding being arranged to oppose the effect produced by the shunt winding.

The general principle upon which the whole arrangement is intended to work is that at the normal speed of the train the dynamo is driving the lamps direct. At lower speeds the accumulator runs the lamps, and at higher speeds the surplus current generated by the dynamo over and above that necessary for the lamps, goes to charge the accumulator.

The following figures are given by the Compagnie Générale Electrique, of Nancy, as the results of tests made with the Vicarino apparatus, which, in this particular instance, was adjusted for a mean speed of 50 kilometers per hour. Obviously, it could be adjusted for any other speed.

COST OF PRODUCTION PER LAMP-HOUR OF 10 CP.	
	Centimes.
Renewal of lamps.....	0.1
(Cost of lamp assumed to be 80 centimes, and life 800 hours on the average.)	
Maintenance of positive plates.....	0.2
(The battery has a capacity of 40 ampere hours and contains 60 kilograms of positive plates at 1 franc 50 centimes per kilogram.)	
Acidulated water, oil, waste, etc.....	0.03
Motive power.....	0.25
(The power absorbed by each carriage is 0.5 hp., equal to 1 kilogram of coal per hour at 2 francs per 100 kilograms.)	
	0.58

Or say 0.6 centime per 10 cp. lamp-hour.

In comparison with this the company cite the following figures, which, it is stated, have

been gathered from the results of other systems of lighting:

	Centimes.
Oil per lamp-hour, 5 or 6 candles.....	4.5
Compressed oil-gas per lamp-hour, 10 candles.....	3.5
Accumulator lighting per lamp-hour, 10 candles.....	3.4
Acetylene per lamp-hour, 10 candles..	2.5

The first cost of installation for the various systems is given as follows:

Oil.....	about 200 fr. per carriage.
Gas.....	800 fr. " "

(Without regard to proportion per carriage of cost of erection of gas plant at station.)

Accumulators (8 lamps of 10 cp. and battery of capacity of 120 ampere-hours)..... 950 fr. per carriage.

Vicarino system (8 lamps of 10 cp. and battery of 40 ampere-hours capacity)..... 1,250 fr. " "

The cost per annum of the various systems, assuming the carriage to be lighted on the average 4 hours per day, is stated to be as follows:

Oil (4 lamps of 5 cp. = 20 cp.).....	262 fr. 80 c.
Gas (4 lamps of 10 cp. = 40 cp.).....	204 fr. 40 c.
Accumulators (8 lamps of 10 cp. = 80 cp.).....	292 fr. ..
Vicarino (8 lamps of 10 cp. = 80 cp. 70 fr. ..	

The company further draw attention to the applicability of their Vicarino dynamo for the generation of electrical energy from a variable source of power such as a windmill, or turbines driven by streams, the volume of water in which depends upon the rainfall.

NATURAL HISTORY IN MECHANICS.

"And now my young friend," said the professor of applied natural history, as he wiped off four or five square inches of one of his great spectacle lenses, "we come to a new and most interesting branch of the study of natural history—its application to the broad domain of practical constructive mechanics.

"I purpose showing you to-day, in part, how the various members of the animal kingdom contribute their share, often important, always interesting and useful, in the economy of practical science; and how, in their humble way, they have been developed—sometimes through long centuries, sometimes by rapid steps—to a condition which permits of their application as active or passive assistants to the mechanism or the constructor.

"We will first consider the vertebrates as our nearest relations in the animal kingdom, and see what useful part they play. The noble horse, once the swift courser of the desert, has been, after successive stages of ordinary slow burden-bearing, evolved into a stationary support for heavy masses, such as boilers and the like. His half-brother, the once much despised mule (of whom it has been contemptuously said that he has no pride of ancestry and no hope of posterity), has he not developed, under favorable circumstances and in proper surroundings, a degree of intelligence and dexterity which permits him to perform, unaided and in greater perfection, the textile tasks of many skilled spinning women? The once combative ram, first in the zodiacal procession—he of the hard head and great power of propulsion—now patiently drives huge piles for our great

wharves, or, snuffing the scent of battle, places himself at the prow of our mammoth warships and crushes the stout sides of the opposing vessels. The faithful dog, too—man's best friend among the quadrupeds—does he not serve to hold in his teeth irregular metal articles which are to be turned in the lathe? And the pig—of his fat body do we not mould great machines? The bull, which is an entity, confines his usefulness principally to furnishing meat for our table and leather for our footgear, lends us his great eyes, through which we reeve ropes. The agile and prehensile monkey has forsaken the forest glades and the lianas of his native land and entered our service as general handy man to wrench off tight nuts, set up bolts, drive nails, and be of use generally.

"Do we consider the volatile division of the animal kingdom—here we find the crane standing patiently on wharves or at railway sidings and lifting for us great burdens, while moving them at our command from place to place. The chivalrous and versatile cock, forsaking his dunghill, not only controls the flow of water and other fluids, but serves to discharge for us our guns. The crow, no less willing than his cousin, the crane, although in lesser degree powerful, raises weights at our bidding, while the gentle cooling dove lends her tail to bind box corners firmly together. And the bat—he of mixed relationship and nocturnal propensities—his humble body serves as building material for our shops and chimneys. The awkward and long-lived goose—she who once saved Rome by her cackling—contributes her awkward neck to the hydraulician while the machinist employs it as well as a tool for turning down materials in the lathe.

"As we descend in the scale we discover that the lurking alligator, now tamed in the service of his fellow-vertebrate man, grips gas pipe like grim death. And the 'slow but sure' turtle has become the indispensable assistant of the daily newspaper, in carrying upon his broad back the characters which the lightning perfecting press gives to the wide world to inform each of its inhabitants of the comings and goings and doing of all the others.

"When we consider the other cold-blooded inhabitants of the watery kingdom, we find the fish binding together the ends of the rails on our great steel highways; while the herring bone is adopted as the best construction for toothed gearings, showing how Nature anticipated proud man.

"We can scarcely investigate a group of the animal creation that we do not find its members humbly serving us in some useful mechanical capacity. The grasshopper once lent his huge, awkward, jointed limbs to the construction of locomotives; the obstinate and persevering beetle still drives wedges for us into the hardest oak, while the butterfly—although ever maligned by the poets as the fittest type of frivolousness and irresponsibility and uselessness—has long served to control the flow of gases, and even of steam in their proper channels. The fly delivers the printed sheets from the press as fast as they are ready, while her mortal enemy, the spider, serves as an integral part of the engine that drives the machines. And even the despised, down-trodden worm—emblem of insignificance and humility—exerts her poor power in driving gearing, so that from the highest down to the lowest rank, the animal kingdom is serving us daily, unheeded and unthanked."—"Carpenter and Builder."

PARIS LETTER.

Special Correspondence of *ELECTRICITY*.**Distribution of Electric Energy in Paris.**

The city of Paris, as we know, is divided into sectors, each of them being supplied with electric power from a central station. The different companies operating in these sectors have a franchise for eighteen years and they are subject to all sorts of charges. It is therefore very interesting to know what results have been obtained under these unfavorable conditions.

As an example we take one of the most important sectors, that of the Place Clichy. The annual report for this sector has just been published and from it we take the following figures:

The original 3,000,000 francs capital has been successively increased until it is now 13,000,000 francs, which actually represents the cost of the plant and the entire system with all its apparatus, switches, etc., showing an average investment of 58 francs per lamp. Since 1891, i. e., one year after the installation, the employees received a share of the profits, which share, in 1898 and 1899, amounted to 15 per cent.

On June 30, 1900, the total power system was 8,300 kilowatts, represented by 276,651 incandescent lamps of 10 candles each, consuming 3 watts per candle. At the close of the business year, which was on June 30, 1891, the total power was 285 kilowatts with 9,517 lamps of 10 candles each. In 1900 power to the extent of 8,300 kilowatts was distributed.

On June 30, 1900, the system had a total length of 94.96 kilometers and had 539,044 kilometers of wiring, the number of meters in use being 5,710. There were 394 elevators, 191 of which were electric, 66 mixed (hydro-electric) and 137 of other varieties. The number of customers on June 30, 1900, was 5,630. The receipts amounted to an average of 11.92 francs per lamp, which gives a total of 3,852,875.80 francs against 1,422,742.85 francs total expenses, leaving net receipts of 2,430,130.95 francs, which have been used to pay off a part of 162,629.80 francs to the city of Paris and to cover the expenses of the sinking fund, interest, dividends, etc. The whole distribution system is armored lead cable and the insulation is perfect. If the conditions were modified the price of 0.15 franc per hectowatt hour, which is far too high, could be reduced; the franchise, however, being for only 18 years renders it difficult to sell at cheaper rates. The question of extending the franchise will soon be discussed in the Municipal Council of Paris, and it is hoped that it will be granted, as in this case the tariffs would be reduced.

Magnetism in Chronometers.

A special essay on this subject was presented to the Academy of Sciences at Paris during one of its last sessions by M. Cornu, who commenced with the assumption that chronometers contain steel parts which are more or less magnetized. He tried to determine the influence of the earth effect on a precision chronometer having a magnetized balance, a fact he had observed some days previous. He resumed his observations by practical instructions to navigators, regarding the important subject of the exact effect which terrestrial magnetism has on watches. It is a fact that they can be made to vary according to their positions in the magnetic meridians. It is necessary, first, to be sure that the balance of

the chronometer is not magnetized; second, to make comparative observations on the chronometer movement in the four azimuths, which might amount to several tenths per day; third, to try to put the chronometer in a box made of thick cast-iron, which would effectually scatter the lines of magnetization.

M. Mascart suggests that the chronometer should be exposed to the action of an alternating magnetic field in order to overcome this magnetization, and says that this method has previously been applied with success.

THE DESIRABILITY OF USING STORAGE BATTERIES IN MEDIUM SIZE STATIONS.*

BY L. G. WHITE.

The idea seems to be quite prevalent among central station men that the storage battery is useful only for the purpose of storing energy, generating it during light load periods and storing it until such time as it may be used to the best advantage.

The storage battery is indeed a very valuable addition to any direct current station for this purpose alone, but I shall endeavor to point out to you some other features of the storage system which I think are as fully important to the medium size station as the one before mentioned.

One of the most valuable features of the storage system is its ability to maintain an even pressure on the bus bars, to which it may be connected. Even though the load may vary greatly, and the demands may be very sudden, such as are occasioned by the starting of direct connected electric elevators and other heavy motor work, the battery will maintain a fairly even pressure at the bus bars of the station. It does this automatically and without any effort whatever on the part of the switchboard attendant.

The question of regulation has been a serious one to central station managers and is becoming more serious every day.

A few years ago the public would accept a very unsteady incandescent light, possibly attributing its unsteadiness to the belief that electricity was then in its infancy, but now, possibly thinking that the infant has had ample time to mature, they demand a bright, steady light with uninterrupted service.

It is possible that the extensive adoption of the Welsbach gas lamp, giving a very steady light though it be of a ghastly color, has had the effect of making the public more critical in the matter of electric lighting; but, whatever the cause, the fact remains that your customers demand a steady light, which means good regulation, and I think most station managers are now striving to attain that end.

I have charts taken from our recording voltmeters. These charts show the pressures at one of our heaviest centers of distribution. They are not selected specimens, but show the actual conditions covering four months; two months with the battery on the line and two months without the battery. I would remark that most of the sharp changes in the pressure were caused by a number of large passenger elevators which are connected quite close to the center of distribution, to which these volt meters are connected. So these variations of

* Abstract of paper read before the Ohio Electric Light Association, at Toledo, August 15, 1900.

pressure were not quite so pronounced over the balance of the system as it was at this particular point.

I think that the medium size station will find this one feature of the storage system fully as important to them, if not more so, than the feature usually considered by the larger stations, that is, the ability of the battery to carry enormous peak loads of comparatively short duration.

The larger stations with their large direct connected units do not experience the difficulties encountered by the smaller stations in the matter of regulation, but even they find it convenient to depend largely on the battery for regulation.

The incandescent lamp manufacturers have brought their lamps to such a point that there is but little left to be desired in the way of efficient lamps, but, in order to get good results from these high efficiency lamps it is necessary to have really good regulation. The better the regulation the better the results from the use of the high efficiency lamps.

Another feature of the storage system, which should appeal strongly to the medium size station, is that it affords a reliable reserve in case of an accident to your generating apparatus. Should an engine break down or a dynamo become disabled, the battery is usually ready to take up the load without any interruption to the service, and will usually carry it until some provision can be made to relieve it, thus saving an "out," the one thing of all others most dreaded by the station managers.

Another way in which the battery has proven itself useful and has made a direct saving of fuel and labor, is by taking care of the loads thrown on the station by sudden storms which are so prevalent in this part of the country during the summer months. Before the battery was installed it was common practice to run more boiler capacity than would have been required had it not been for the sudden jumps in the load caused by a passing thunder cloud, and even then it was frequently necessary to get in another boiler in short order, using boxes, barrels or anything that will make steam quickly, and then, perhaps, after only a few minutes' use, have to let the boiler cool off again, thus losing a large per cent. of the heat units stored in that boiler.

With the aid of the battery we are able to run both the boilers and engines in the most economical manner, thus making a saving which amounts to considerable in a year's run, and yet the saving is of such a nature that it is difficult to reduce it to dollars and cents, consequently the battery may not get all the credit due it from this source.

During the heavy winter load we find the battery very convenient in keeping up the pressure at the ends of the longer feeders. We connect such feeders as require boosting to an auxiliary bus and then connect the battery to the auxiliary, and by means of one of the end-cell switches we can raise the pressure on these feeders as high as may be necessary.

Usually that part of the load which requires boosting is so small that we would get very poor efficiency if we were to use a pair of dynamos for this purpose, but, however, should the load on these feeders be heavy enough to warrant it, we would cut in a pair of machines on the auxiliary bus to supply the load and charge the battery with whatever capacity was left in that pair of machines, so you see we would

get an economical load for the machines under all conditions.

A short circuit on heavy lines, especially if they are underground, usually means trouble for the station man and it is not an uncommon thing to have machines reversed in this manner; this of course means a shut down while fresh machines are started to repolarize the reversed machines or to burn off the short circuit. This sometimes requires a number of machines and always takes an appreciable length of time, during which your customers are saying pleasant things about electric lighting in general and about your company in particular, or perhaps are making a frantic effort to inform you by telephone that there is something wrong with their lights. We have had our usual number of short circuits since the battery was installed, but not in a single instance has the operation of the plant been affected in the least. In fact, the switchboard attendant usually learns of this kind of trouble first, from some one of the outside men. We have burned some very heavy copper and the only indication at the station has been a drop of pressure shown by the recording voltmeters and that only for an instant.

The cost of maintenance of the battery, which consists of 150 cells of chloride accumulators, has been only a very small amount in our case; the entire expense is represented by about five hours' labor per week, and about 200 gallons of distilled water per week. The water we distill in a home-made still and it costs but very little indeed. The labor is applied in reading the voltage and specific gravity of each cell about three times per week and refilling the cells with distilled water, besides keeping the battery room clean. I presume that sooner or later we will have to begin making repairs on the battery, but now after one year's constant use the plates show no evidence of deterioration.

Victory for a Trolley Company.

A jury in the New York Supreme Court on January 23, before Justice Marean, handed up a sealed verdict for the Brooklyn Heights line in a suit brought against it by Thomas Troy, a cook on a steam yacht, to recover \$10,000 for alleged injuries said to have been caused by a conductor allowing the plaintiff to stand on the footboard of an open car on September 21, 1899. Troy testified that he was knocked off the step at Third avenue and 42d street and received wounds about the head and body. It was shown to the satisfaction of the jury that Troy was negligent of his own safety.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended January 23:

Antwerp, 18 cases, \$2,535; Argentine Republic, 64 packages, \$5,410; 5 cases, \$344; Australia, 565 packages, \$42,938; 5 motor vehicles, \$2,000; 32 reels cable, \$13,029; Barcelona, 1 automobile, \$800; 10 cases, \$29; Berlin, 8 cases, \$748; Birkenhead, 2 cases, \$338; Brazil, 150 packages, \$11,843; Bremen, 62 cases, \$1,666; British East Indies, 82 packages, \$9,316; 78 cases, \$8,718; British West Indies, 41 cases, \$1,675; Central America, 132 packages, \$1,755; Chili, 32 packages, \$1,200; Cuba, 146 packages, \$3,540; Dunkirk, 22 cases, \$4,027; Dutch West Indies, 22 packages, \$474; Ecuador, 211 packages, \$879; Frankfort, 1 package, \$70; Glasgow, 212 cases,

\$4,634; Hamburg, 13 packages, \$1,538; Havre, 167 cases, \$24,729; Hull, 17 cases electrical agricultural machinery, \$2,000; Leeds, 26 packages, \$1,502; Lynn, 3 cable reels, \$840; Liverpool, 96 packages, \$7,420; London, 447 packages, \$14,524; 1 reel electric cable, \$297; Manchester, 138 cases, \$18,323; Mexico, 198 packages, \$5,596; 15 cases, \$1,825; Peru, 131 packages, \$1,282; Preston, 107 packages, \$17,400; Riga, 5 cases, \$255; Santo Domingo, 19 packages, \$327; 1 case, \$74; Southampton, 58 packages, \$2,429; U. S. Colombia, 33 packages, \$1,241; Uruguay, 18 packages, \$500; Venezuela, 4 cases, \$113.

PERSONAL MENTION.

Mr. J. G. Noyes, secretary and general manager of the National Electrical Manufacturing Company, died recently in Milford, Conn.

Mr. W. H. Parkhill and Messrs. P. M. Dawson and F. Z. McGuire, electrical engineers from London, Eng., are in this country arranging for the work on the London Underground Electric Railway.

Mr. K. W. Mansfield has been appointed superintendent of the Waterbury and New Britain Conn., railway lines, and also has direct supervision of the electric light plants in those two cities.

Mr. Isaac L. Rice, president of the Consolidated Railway, Electric Light & Equipment Company, recently returned from Europe after closing a contract with Vicker Sons & Maxim of England, for the use of the patents belonging to the company in Great Britain and Continental Europe.

Mr. Charles P. Dwight of the Great Northwestern Telegraph Company of Toronto, Ont., died last week in the Western Hospital after a short illness.

INCORPORATIONS.

The Robinson Motor Company, New York City. Capital stock, \$100,000.

The Rock River Electric Company, Beloit, Wis. Capital stock, \$50,000.

The Hoopeston Electric Light & Heating Company, Hoopeston, Ill. Capital stock, \$30,000. Incorporators: Frank Lindley, Robert Holmes and Fred B. Penwell.

The Hunter Fan & Motor Company, Fulton, N. Y. Capital stock, \$100,000. Directors: J. C. Hunter, Thomas Hunter and William Hunter, all of Fulton.

The New Jersey Electrical Construction Company, Newark, N. J. Capital stock, \$50,000. Incorporators: George W. Cook of Bloomfield, Howard C. Baldwin and Charles E. Baldwin of Newark.

The Sunset Electric Light & Power Company, San Francisco, Cal. Capital stock, \$300,000. Incorporators: J. Magnin, M. H. Schoenberg, H. W. Hunsaker, B. Sharp and others.

The Redstone Company, Santa Fe, N. M.—to engage in the lumber business and the building of electric works. Capital stock, \$25,000. Incorporators: Parthena S. Ginn, Rolla D. Ginn and Owen L. Scott.

COMMERCIAL PARAGRAPHS.

Catalogue No. II of the Clayton Air Compressor Works, 26 Cortlandt street, New York, has reached this office. This catalogue, which is handsomely gotten up, contains some 80 pages of interesting matter, describing and illustrating the many types of Clayton air compressors, air receivers, vacuum pumps, carbonic acid gas and high pressure compressors and the Clayton air-lift pumping system. Among the other contents of this catalogue will be found full information relative to the transmission of compressed air and capacity lost by air compressors in operation at various altitudes. Copies of this catalogue will be issued for gratuitous distribution and will be forwarded upon application.

Since the beginning of the new century the Sprague Electric Company opened another branch office to facilitate the handling of its constantly increasing business in the South. The new office is located in Baltimore in the Guardian Trust Building on the corner of Calvert and German streets. The Baltimore office will enable the company to keep in closer touch with the large amount of Government work constantly being done and also to handle more conveniently the increasing demand for its various products throughout the South. The manager of the new office is Mr. W. H. A. Davidson, who goes there from the New York office where he has

been for many years. He has sold Lundell motors ever since they have been on the market, and is thoroughly familiar with their characteristics and superior features. A representative of the company says that during the next four years of prosperity there will be many plants and machine shops equipped with electrically driven machines and the Sprague Company expects a large share of the business. The products of the company have long stood the test of actual service under exacting conditions and have taken front rank in their respective classes. The personnel of the company in its executive departments guarantees fair dealing and reasonable prices.

The New York Insulated Wire Company, 18 Cortlandt street, has just issued an attractive catalogue descriptive of the various types and sizes of wire and cable turned out by it. Besides a number of tables showing prices there appears the National Board of Fire Underwriters' Rules for rubber-covered wire, tables showing the carrying capacity of wires, and other information of interest to the trade.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JANUARY 22, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

- 666,258. Electric Traction. Robert Brown, Birmingham, Eng. Filed Aug. 21, 1900.
- 666,303. Storage-Battery Transfer Car. George H. Condit, New York City, assignor to the Electric Vehicle Company, same place. Filed Sept. 3, 1898. Renewed June 28, 1900.
- 666,306. Electric Railway. Johannes W. Ehlers, Hamburg, Germany. Filed Dec. 19, 1899.
- 666,399. Street-Car Fender. Richard Thompson, Buffalo, N. Y., assignor of one-half to George E. Troup, same place. Filed April 19, 1900.
- 666,404. Rail-Bond. Montraville M. Wood, Chicago, Ill. Filed Nov. 22, 1900.
- 666,418. Electric-Car Heater. Edward E. Gold, New York City. Filed Aug. 1, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

- 666,400. Cord-Adjuster for Electric Lights. William C. Tregoning, Hartford, Conn. Filed Nov. 19, 1900.
- 666,602. Electrical Glow-Lamp. Arthur Couch, London, Eng. Filed June 11, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

- 669,255. Electric Switch and Resistance. Claude W. Atkinson, Cardiff, Eng. Filed June 2, 1900.
 - 666,315. Method of Construction of Electric Motors. Frederick A. Johnson, Binghamton, N. Y., assignor to the Stow Manufacturing Company, same place. Filed Aug. 30, 1900.
 - 666,454. Electrical Measuring Instrument. Henry P. Ball, New York City, assignor to the General Incandescent Arc Light Company, same place. Filed June 12, 1900.
- ##### TELEPHONES AND TELEPHONE APPARATUS.
- 666,444. Telephone-Exchange Central-Station Switchboard Apparatus. George K. Thompson, Malden, and Ernest C. Robes, Medford, Mass., assignors to the American Bell Telephone Company, Boston, Mass. Filed Feb. 13, 1900.
 - 666,457. Privacy Device Apparatus for Polystation Telephone-Lines. John A. Barrett, Summit, N. J., assignor to the American Telephone & Telegraph Company of New York. Filed Sept. 8, 1900.

MISCELLANEOUS.

- 666,271. Column-Printing Telegraphic Instrument. Frederick H. W. Higgins, London, Eng., assignor of one-half to Wilfred King, same place. Filed Oct. 10, 1899.
- 666,329. Lightning-Arrester. Charles A. Rolfe, Chicago, Ill., assignor to the Rolfe Electric Company, same place. Filed July 13, 1899.
- 666,361. Underground Conduit. Isaac D. Smead, Toledo, O. Filed Jan. 29, 1900.
- 666,381. Illuminated Clock. Roch R. Gareau, Detroit, Mich. Filed Dec. 18, 1899.
- 666,387. Apparatus for Producing Alkali, Electricity and Hydrogen from Alkali-Metal Amalgam. Josiah W. Kynaston, Liverpool, Eng. Filed Dec. 5, 1899.
- 666,431. Electrotherapeutic Apparatus. John S. Mead, Buffalo, N. Y., assignor to Albert W. Courtney, same place. Filed Aug. 25, 1900.
- 666,439. Sparking Igniter for Explosive-Engines. Gustav L. Reenstierna, Winchester, Mass. Filed March 3, 1900.
- 666,451. High and Low Water Alarm. Charles E. Zimmerman, Syracuse, N. Y. Filed April 6, 1900.
- 666,545. Lightning-Arrester. William N. McAnge, Suffolk, Va. Filed March 23, 1900.
- 666,586. Insulator. Henry W. Woolbert, Smethport, Pa. Filed Aug. 27, 1900.
- 666,618. Electric Igniter. Charles D. Wright, Chicago, Ill. Filed May 29, 1899.
- 666,628. Fire-Alarm. Walter J. Partridge, Norwood, Mass., assignor to the National Fire Alarm Company of Malae. Filed July 14, 1900.

THE TELEPHONE WORLD.

Another Mammoth Telephone Organization.

The Atlantic Telephone Company was incorporated at Albany January 23, with a capital stock of \$5,000,000. The company proposes to maintain a telephone system connecting New York City, Albany, Syracuse, Rochester, Buffalo and all the cities and villages along the route, which cities are also to be connected with other municipalities in the United States and Canada. The capital is divided into 50,000 shares at the par value of \$100 each. The directors are William H. Stayton, of Yonkers; John A. L. Campbell, Charles B. Reid, Arthur B. Lafar and James G. Shaw, of New York City; George H. Mann, of Brooklyn, and Warren L. Sawyer, of Nyack. William H. Stayton, when asked about the Atlantic Telephone Company, said that the company had been incorporated to establish a telephone system in New York in opposition to the New York Telephone Company, and that it was expected that long-distance connections would also be established. He said that the company had a franchise permitting it to do business in this city, and that work would be begun at once. The only patents that the company owned so far as he knew were for an improved switchboard. The first work would be to solicit subscriptions and start an exchange. The law requires 6,000 subscribers before an exchange could be installed and service begun.

Solicitor Thomas K. Leidy lately filed the application of the Schuylkill Valley Telephone & Telegraph Company at Harrisburg, Pa., asking for a charter of incorporation. The application will be heard on February 7. The incorporators are Ira W. Stratton, Fred S. Neudoerffer, Dr. Thomas H. Leidy, Orrin S. Doolittle and Louis Heilbron, all of Reading, Pa. The company has introduced an ordinance into city councils, asking permission to erect poles, string wires, etc. The new corporation claims to have sufficient capital to start operations as soon as the State charter and city franchise are granted. The telephone is to be the principal part of its business. The incorporators decline to state the amount of capital at their command, but say it is ample.

From Big Sandy, Ga., comes the report that the stockholders of the Dixie Telephone Company have elected the following officers and directors: J. F. Dowdy, president; John Pafford, first vice-president; T. V. Burton, second vice-president; U. A. Potts, secretary and treasurer. The board of directors is as follows: S. C. Cooper, chairman; Z. C. Gatlin, secretary; Ed McSwain, H. G. Brooks, P. Q. Bane, J. W. Gibson, R. C. Crockett, D. B. Thomas, W. H. Evans and B. F. Davidson.

The Muskeget life saving station is to be connected by telephone with Nantucket, Mass. A Government cable has been laid by the steamer Petrel. The first section, 1 1/4 miles long, extends from Nantucket to Tuckerneck, where a line two miles long will cross the island and join the second cable section of 2 1/4 miles to Muskeget. Herman Wagner, superintendent of construction of the life saving telephone service, is about to overhaul the entire telephone system of the life saving stations and lighthouses on Nantucket Island.

The annual meeting of the Interstate Telephone Company was held at St. Johnsville, N. Y., a short time ago, and the following directors were elected to serve the ensuing year: W. Alter, A. P. Roth, of New York City; Ed Beekman, Dr. O. B. Shedd, Fred Engelhardt, George C. Butler and H. L. Sutherland. The company's connections now reach the Adirondacks at Paul Smith's on the north, Amsterdam on the east and Frankfort on the west.

At the annual meeting of the stockholders of the Cortland J. N. Y., Home Telephone Company the following directors and officers were chosen: Dr. C. D. Ver Nooy, C. P. Walrad, R. L. Davis, William Martin, G. J. Mayer, H. L. Smith, E. L. Barber, J. S. Bralley, Jr., and W. H. Foster. President, C. D. Ver Nooy; vice-president, C. P. Walrad; secretary, H. L. Smith; treasurer, G. J. Mager; attorney, R. L. Davis; manager, W. H. Jones.

The promoters of the Independent Telephone Company are meeting with encouraging success in Detroit, Mich., and have already secured over half the number of subscribers with which it will be necessary to begin an exchange. The company will charge a five-cent rate to all points in Wayne County, and special rates to other points.

The new telephone company of Citrus and Hernando Counties, Fla., has organized and its first connection is with Ocala.

Negotiations are on foot to inaugurate telephone connections between Amesville and Barataria, La. Syndic John Graft, of Barataria, is pushing the matter vigorously.

Ferrets Used in Laying 'Phone Wires Underground.

In an Iowa town the telephone company was engaged in laying underground wires, placing them in small tubing laid in the streets. Citizens who were observing the operations, were wondering how the wires were to be placed inside those casings as the latter were laid in the ground in long sections. When ready for this operation the men produced a little bright eyed ferret, tied a light string to it and started it through the pipe. When it came out at the other end a larger string was pulled through, and then the wires which were desired. The men stated this was their regular method of operation, and although they sometimes had to wait quite a time for the ferret to come through, it was an improvement on the rod method made use of in large cities.

The use of barbed-wire telephones in San Joaquin County, Cal., is growing to such an extent as to cause grave business fears in the minds of the telephone companies. The make-shift wires are now in use in all the farm houses in some portions of that county, and farmers ring up each other as handily as they would were they city subscribers. The barbed wires strung along the fences are used as a means of conducting the vibrations.

The Port Jervis, N. Y., Telephone Company recently elected the following officers: President, Moses Dupuy; vice-president, Dr. W. L. Cuddeback; secretary, Wm. A. Parrshall; treasurer, J. Wallace Gordon. The company has 348 'phones, and is in a prosperous condition. Extensive improvements and enlargements are contemplated in the spring.

At the recent meeting of the stockholders of the Camden, Tenn., Telephone Exchange, it was ascertained that stock had been subscribed to the full extent, and the contract will shortly be given out for the erection of the system. The system has been needed a long time and is sure to prove a success.

The Tazewell, Va., telephone lines, which have heretofore been owned and managed by C. C. Long, have been formed into a stock company. The stockholders consist of C. C. Long, George W. St. Clair and B. W. Stras. The line to Tip Top will be extended to Bluefields, and a line will be built running to Cedar Bluff, which is west on to Richlands, and thence to Raven, and the mines of the Coal Creek Coal Company.

A damage suit has been settled in Tuscaloosa, Ala., for which no precedents in law could be found. O. B. Wilson was talking over a telephone during a thunder storm and was struck by lightning and killed. Suit was brought for damages and was settled by the payment of \$1,800 by the telephone company.

The annual meeting of the stockholders of the Rome, N. Y., Home Telephone Company, was held lately and the following directors elected: John S. Wardwell, Fred M. Shelley, John E. Mason, William J. Grogan, James S. Brailey, Jr., Ed. L. Barber and Robert Earl, 2d.

A citizens' mass meeting at the court-house in Lexington, Ky., recently adopted resolutions denouncing the East Tennessee Telephone Company for alleged extortion and indorsed the proposed new company.

The Warren (O.) & Niles Telephone Company has organized and elected the following officers: President, Washington Hyde; vice-president, Jules Vautrot, Jr.; manager, E. G. Miller; secretary and treasurer, J. J. McClean. A dividend was declared.

The Overland Telephone Company recently met at Lehigh-ton, Pa., and organized permanently by electing N. M. Balliet, president; A. F. Diefenderfer, vice-president; P. A. Prutzman, of Slatington, secretary, and A. P. Berlin, of Slatington, treasurer.

The Mississippi Valley Telephone Company's plant, owned and conducted in Keokuk, Ia., by J. C. Hubinger, has been sold to Chicago parties.

The Inland Telephone Company of Birmingham, Ala., will change hands the first of next month, Mr. Luke Sherrill taking charge.

The telephone line between Westmoreland and Hecla Works, N. Y., is completed and ready for future use.

An independent telephone plant will very likely be put in at Paris, Ky.

The Otisco & Cedarville, N. Y., telephone line was completed a short time ago.

The following changes in the management of the New York and Pennsylvania Telephone & Telegraph Company in Binghamton, N. Y., are announced: General Manager, W. N. Estabrook of Elmira, who retires on account of ill-health, is succeeded by H. F. Stevens of New York, who is also the secretary and treasurer of the company. E. B. Rogers, of Elmira, who was the assistant general manager, has been promoted to the position of general superintendent. District Manager W. C. Sexsmith of Binghamton, is planning to install an entirely new equipment at the local exchange, including a modern multiple switchboard and other apparatus, which will be up-to-date in every respect. The improvements are necessitated by the increase of business. In this connection an average of 31,000 connections daily are made, which is an increase of more than 500 per cent. over the business of the same period last year.

The average business man of San Francisco, Cal., who has tried to further his own interests and save his time by attempting to use a telephone during rush hours, and who has to pay the exorbitant bills of the local company for his pains, welcomes an effort that is making at Sacramento to pass a bill regulating telephone charges and bringing them under municipal direction, as are water and gas rates. The measure declares that the right to furnish telephone service is a public franchise, to be obtained only as provided by law, and which is forfeited by disregard of rates fixed in accordance with the provisions.

The citizens of Maynardville, Tenn., are agitating the matter of putting in a telephone exchange, and it is said that a number of citizens of that town are ready to organize a co-operative company, similar to that which has proved so successful at Maryville and other towns in that State. If such a company is organized, efforts will be made to have the People's Telephone Company of Knoxville build a toll line to a connection with the new exchange.

In the House of Representatives at Boston, on January 25, Representative Hunt, of Weymouth, introduced a bill to establish a rate of not more than \$100 in cities of more than 500,000 inhabitants; between 100,000 and 500,000 inhabitants, a rate of \$75; cities of from 20,000 to 100,000, a rate of \$50; and cities of less than 20,000, not exceeding \$25 for annual unlimited telephone service within a radius of 25 miles of central station.

The telephone war has struck Bath, N. Y., and the chances of cheaper telephone rates for the people of that village are exceedingly bright. Recently the village board of trustees held a special meeting to consider the application of the Bath Telephone Company for a franchise to put up poles in the streets of the village.

A telephone line will be put in Greenford, O., by the Columbiana County Company, or Independent, of Youngstown.

The Home Telephone Company of Niagara Falls, N. Y., proposes to extend its lines throughout Niagara County.

The local telephone exchange at Albert Lea, Minn., was sold a short time ago to S. H. Cady, the price being \$10,000.

The New England Telephone Company extended its line to Grange, N. H., last week.

Work will soon begin on a telephone exchange at Madisonville, Tenn.

TELEPHONE INCORPORATIONS.

The People's Telephone Company, Sardinia, O. Capital stock, \$2,500.

The Liberty Center Telephone Company, Liberty Center, O. Capital stock, \$10,000.

The Toledo, Telephone, Telegraph & Message Company, Toledo, O. Capital stock, \$25,000.

The Corning Telephone Company, Corning, Ia. Capital stock, \$10,000. Incorporators: Frank L. Mercer and J. J. Mercer.

The Daviess County Telephone Company, Gallatin, Mo. Capital stock, \$5,000. Incorporators: C. J. Bain, J. W. P. Love, M. L. Bain and others.

The Spencer Telephone Company, Spencer, Ia. Capital stock, \$15,000. Incorporators: Charles McAllister, G. G. Greaves, M. E. Griffin, M. M. Preso and F. M. Tuttle.

The Mitchell County Telephone System, Osage, Ia. Capital stock, \$50,000. Incorporators: J. W. Barrett, A. E. Roberts, G. E. Marsh, F. J. Atherton, C. R. Groves, J. W. Annis and C. F. Bennett.

GENERAL ELECTRICAL NEWS.

Lighting.

Ambler, Pa.—This village is advertising for bids to light the streets of the town.

Bremerton, Wash.—S. A. Stephens from Mt. Vernon has been here recently looking up the feasibility of putting in an electric lighting plant.

Cloverport, Ky.—The citizens of this place are agitating the question of building an electric light plant.

Dundee, Ill.—The city council of West Dundee is discussing the question of lighting its streets with electricity.

Emporium, Pa.—The borough council has decided to submit the matter of a municipal electric light plant to a vote of the people at the February election.

Fredericktown, O.—The citizens of this town are agitating the question of erecting an electric light plant.

Gary, S. D.—The question of erecting an electric light plant here is being discussed.

Hood River, Ore.—The council has received a proposition for an electric light plant.

Junction City, Ore.—This city is considering a proposition for electric street lights.

Kirkwood, Ill.—The citizens of this place are agitating the subject of establishing an electric light plant.

Lexington, Miss.—The Ice, Light & Water Company of this place elected J. E. Stanfield president, and will erect an electric light plant in the early spring.

Lisbon, O.—This city will construct its own electric light plant and operate same in connection with the waterworks.

Minden, La.—F. Drake, T. Crichton and R. H. Miller have received a franchise for the erection of an electric light plant.

Nelson, B. C.—The city council will seek authority to establish an electric light and power works at Bonnington Falls to meet civic needs.

Osborne, Kan.—C. and H. Hillebrandt contemplate the erection of an electric light plant here.

Pleasantville, N. Y.—This village has accepted Walter W. Law's proposition to light it with electricity for one half cent an hour for each lamp.

Red Lodge, Mont.—The Rocky Ford Coal Company contemplates the erection of an electric light plant here.

Sharpsburg, Pa.—At a recent meeting of the village council the finance committees were instructed to get bids on two 150 horse power boilers for the electric light and water plant. Extensive improvements are contemplated.

Smith Centre, Kan.—The people here are thinking of putting in electric lights.

Stanford, Ill.—This town is agitating the question of electric street lights.

Two Rivers, Wis.—The city council at its recent meeting granted a franchise for the installation of an electric light and waterworks plant to J. V. Miller & Co. of Chicago, to cost \$60,000.

Waitsfield, Vt.—Moriarity Brothers propose to erect an electric light plant here.

Waterloo, Ind.—Messrs. Gruhike & Flack were recently granted a franchise for lighting the streets of this city with electricity.

Street Railways.

Conneaut, O.—A charter was lately granted to the Conneaut & Erie Railroad Company with \$500,000 capital stock, with J. S. Van Cleve president. The company contemplates building an electric road from Erie to this city.

Flemington, N. J.—The Central New Jersey Trolley Company is procuring franchises for the operation of lines affecting the principal towns in Hunterdon and Warren Counties.

Gainesville, Ga.—There is talk of an electric railroad being built from the public square to the Pacolet cotton mills at New Holland, two miles distant.

Gettysburg, Pa.—This city is the objective point of three electric railroads now being planned by three separate companies of capitalists. Work will probably begin on two of the roads during the coming summer.

Greenfield, Mass.—Plans are being made for several new trolley lines in Franklin and Hampshire Counties. It is expected that Northampton and this place will be connected next summer.

Iowa City, Ia.—There is talk of building an electric line between here and Williamsburg.

Jersey Shore, Pa.—Harrisburg capitalists are preparing to construct a six-mile trolley line from Jersey Shore Junction to the village of Antes Fort.

Joplin, Mo.—J. F. Megargel and W. H. Baukington, of Scranton, Pa., have been here lately looking over the proposed route for the new electric line for which the council recently granted a franchise to F. N. Moore.

Junction City, Kan.—The War Department recently granted permission for the electric railway company in this city to build a railway from here to Fort Riley.

Manheim, Pa.—Among the various new trolley projects in Lancaster County is a line to run from here by way of Mastersonville to Mt. Gretna in Lebanon County.

Mason, Mich.—The Lansing & Southeastern Electric Railway Company has asked the council for a franchise to erect and operate an electric line.

Meriden, Conn.—The Meriden & Southington Compound Tramway Company has completed the purchase of a large tract of land between the Southington road and West Peak, and in the coming spring will build a line up the peak.

Milwaukee, Wis.—Attorney Clarence Darrow represents some Eastern capitalists who are figuring on building an electric road from this city to Lake Geneva.

Mount Vernon, Ill.—An electric railway line is projected from the town of Whittington, 16 miles south of here, on the Chicago and Eastern Illinois road, to Ewing, 3 miles east of Whittington. The chief movers in the enterprise are some Chicago capitalists, aided by a number of wealthy Ewing citizens.

Newport, N. H.—The electric road from here via Croydon, Grantham and Springfield to George's Mills is considered to be a sure thing.

Newtown, Pa.—The Northampton Farmers' Club has adopted a resolution petitioning the Union Traction Company or any other traction company to build an electric road from Willow Grove to Hatboro, Ivyland, Richboro, and thence to this place and possibly Yardley.

New York City.—The project of an electric line between this city and Boston may be carried out in the near future.

Oneida, N. Y.—There is some talk of connecting this village and Kenwood by an electric railway.

Philadelphia, Pa.—The first move toward the establishment of a trolley line from this city to Trenton was made last week.

Phoenixville, Pa.—The Phoenixville & Bridgeport Electric Railway Company will erect an electric street railway 12 miles long and it will connect with the Norristown & Philadelphia Electric Railway at Bridgeport. A 300 hp. power house will be built at Valley Forge and work on the new road will be commenced about March 1.

Spiceland, Ind.—The town board has granted a franchise for an electric line through the streets of the town to the company projecting the Muncie, New Castle and Knightstown road.

Waynesboro, Pa.—Baltimore capitalists promise to build an electric railway from here to the mountain summer resorts, four and five miles from this place, during the coming year.

Manufacturing.

Brooklyn, N. Y.—The H. Krantz Manufacturing Company of this city has recently been organized for the purpose of dealing in switchboards and electrical appliances with a capital of \$150,000. Among those interested are H. T. Krantz, A. N. Nielson, and W. M. Moore, all of Brooklyn.

Hamilton, O.—The Anness Freeman Manufacturing Company was lately incorporated with a capital stock of \$25,000. The prime movers in this new concern are:

W. H. Anness, W. P. Freeman, Louis F. Utz, Aaron Wesco and W. D. Campbell. The company will manufacture motors and generators.

Lynn, Mass.—An industry has been established by the Eastern Electric Company of Middleton, which has moved here, and will start manufacturing incandescent lamps at once. E. W. Cushing, of Boston, is president; H. H. Van Saggen, general manager, and Harry H. Hubbard, of Boston, controls the stock.

Menomoneie, Wis.—The Menomoneie Submerged Electric Motor Company, capitalized for \$100,000, will on February 1, with thirty operatives, begin manufacturing. The stockholders are mostly Menomoneie men, and include J. H. Stout as president and John Hopwood as secretary and treasurer.

New York City.—James F. Hughes, Henry E. Bailey, J. Howard Diltz, of Brooklyn; Robert A. McCord, of this city; Nathan I. E. Webb, Henry Webb and William Feirch, Greenwich, Conn., are the directors of the James F. Hughes Company recently formed here to manufacture electrical supplies with a capital of \$10,000.

Portland, Me.—The Commonwealth Motor Company has been incorporated to manufacture and deal in engines and machinery. It is capitalized at \$500,000.

St. Louis, Mo.—The Missouri Electrical Manufacturing Company has been organized in this city with a capital stock of \$20,000. Robert W. Moore, Fred B. Little and William F. Little are all interested in the concern.

Company Matters.

Lockport, N. Y.—The annual report of the Cowles Electric & Smelting Company of this city was recently filed at the county clerk's office, and is as follows: Capital stock, \$1,000,000 paid in. Debts, \$165,667.27, exclusive of capital stock. Assets, \$192,448.14.

Mechanicsville, N. Y.—The stockholders of the Hudson River Power Transmission Company of this place lately elected these directors: Gen. George S. Fields, Gen. Francis V. Greene, R. C. Bord, Gen. Edmund Hayes, George M. Furman, J. R. McKie and R. M. King. The directors elected the following officers: President, Gen. Fields; vice-president, Gen. Greene; treasurer, R. C. Bord.

Power and Transmission.

Buffalo, N. Y.—Capitalists of this city are interested in a plant to transmit electric power from Niagara Falls to Rochester.

Concord, N. H.—The Manchester Electric Company is now taking the preliminary steps looking to the erection of an electric power plant in New England at Garvin's Falls, and it is probable that ground will be broken early during the coming spring.

Automobiles.

Branford, Conn.—Louis A. Fiske, proprietor of the Branford Driving Park, is making preparations for an automobile line to connect the fair grounds with the railroad station near Pine Orchard.

Connellsville, Pa.—The Baldwin Automobile Manufacturing Company of this city, capitalized at \$250,000, made an assignment last week.

New York City.—Henry Sanderson, president of the New York Electric Vehicle Transportation Company, which operates the Fifth Avenue stage line, recently said: "We are constructing several more automobile stages at present and two of these will be placed in operation within a few weeks. They will be double deckers. By early spring we hope to have many more automobile stages in operation in Fifth avenue."

Sandy Hill, N. Y.—Preliminary steps have been taken to organize a stock company for the manufacture of an automobile patented by Joseph Barsaloux under the name of the Steering Gear Automobile Company. The officers are: President, Joseph Barsaloux; vice-president, Richard Pender; secretary, Roswell Hall; treasurer, William A. Walker.

Schenectady, N. Y.—The Iliion Automobile Works is about to be located in this city.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16 $\frac{1}{2}$ @ 16 $\frac{3}{4}$ c.; Lake, 16 $\frac{1}{4}$ @ 16 $\frac{1}{2}$ c.; casting, 16 $\frac{1}{2}$ @ 16 $\frac{3}{4}$ c.

The annual meeting of the Telephone, Telegraph and Cable Company of America will be held February 12.

Advices from Boston state that over \$1,000,000 of the \$7,500,000 Erie Telephone 5 per cent notes have already been placed.

Business failures in the United States last week numbered 306, against 231 the same week last year; in Canada there was 46, against 38 last year.

The New England Telephone & Telegraph Company has declared a dividend of \$1.50, payable February 15. Books close January 31 and reopen February 15.

It is stated that the Philadelphia Union Traction Company's net earnings for December last showed an increase of about \$15,000 over the figures for December, 1899.

The General Electric Company of New Jersey will soon absorb the Plainfield (N. J.) Electric Light Company. The former company purposes to absorb all the lighting plants of New Jersey.

The Westinghouse Electric Company has declared the regular quarterly dividend of 1 $\frac{1}{2}$ per cent. on the assenting stock, payable February 15. Books close February 5, and reopen February 21.

The German Secret Process Steel Ball Company of New York was chartered at Dover, Del., January 25. It purposes to deal in steel, copper, brass, aluminum, and other metals. The capital is \$7,000,000.

The Philadelphia Electric management is credited with having bought \$2,000,000 of the company's 4 per cent. bonds for the purpose of retiring them. This was done out of the proceeds of the last call.

The Chicago Union Traction Company will pay the regular quarterly dividend of 1 $\frac{1}{2}$ per cent. on the stock of the West Chicago Street Railway Company, which it guarantees, on February 15. Books close February 5.

The Coney Island & Brooklyn Railroad Company has declared the regular quarterly dividend of 2 $\frac{1}{2}$ per cent. and an extra dividend of 2 per cent., payable February 1. The rate heretofore has been 2 $\frac{1}{2}$ per cent. without extra.

The Lancaster (Pa.) Light & Power Company will be incorporated soon, with a capital of \$5,550,000, to absorb the Conestoga Traction Company, the Lancaster Railway Company, the Lancaster Gas, Light & Fuel Company and the Edison Electric Light Company.

The Staten Island Electric Railway Company reports for the quarter ended December 31, 1900: Gross earnings, \$41,660; operating expenses, \$30,240; net earnings, \$11,420; other income, \$184; total income, \$11,604; fixed charges, \$25,000; deficit, \$13,396; profit and loss deficit, \$163,681.

The Manchester Traction, Light & Power Company has been incorporated in New Hampshire with \$1,500,000 capital. The stock has been placed with Tucker, Anthony & Company of Boston. An issue of \$1,500,000 5 per cent. bonds has been sold to Vermilye & Company of New York.

The directors of the Chicago Telephone Company have decided to issue \$1,000,000 new stock in April. It will be delivered April 8 at par to shareholders of record March 27. This will make the stock outstanding at that time \$8,000,000. In all probability another \$1,000,000 will be issued in October. The proceeds of the sale of these additional shares will be devoted to the payment for extensions and improvements.

Directors of the Roanoke Railway & Electric Company have authorized a payment of 3 per cent. on the issue of \$190,000 of the income bonds of that company. This is after providing for the payment of the interest on the \$300,000 first mortgage bonds, and leaving a surplus, which was carried to the sinking fund. This is the first payment to be made on the income bonds, which are largely held in Baltimore.

The Hudson River Telephone Company has declared the regular quarterly dividend of 1 $\frac{1}{4}$ per cent. and an extra dividend of 1 per cent., making the total dividends for the year 6 per cent. The dividends are payable February 1 to stocks of record January 22. It is the intention of the company to continue dividends at the rate of 6 per cent. per annum. The company did a large business last year and also made extensive improvements. After the dividends are paid there will be a good-sized surplus remaining.

At the annual meeting of the stockholders of the Minneapolis General Electric Company held in Jersey City on January 7 the following directors were elected: E. S. Webster, E. Wadsworth, M. B. Koon, H. K. White, E. A. Merrill, C. A. Stone, L. S. Cushing, Russell Robb and J. B. Dill. These directors held a meeting on January 21 at which the following officers were elected: President, M. B. Koon; treasurer, E. S. Webster; secretary, E. Wadsworth. A dividend of \$3 per share was declared, payable February 1 to preferred stockholders of record January 21. Transfer books closed from January 21 to February 1 inclusive.

The annual meeting of the stockholders of the Brooklyn Rapid Transit Company was held on January 25. The following directors were elected: A. N. Brady, August Belmont, H. C. Duval, A. R. Flower, E. H. Harriman, R. Somers Hayes, J. G. Jenkins, W. G. Oakman, H. H. Porter, Clinton L. Rossiter, Henry Siebert, G. H. Valentine and Col. T. S. Williams (secretary). The re-election of the directors quieted rumors about changes of interest which have been in circulation for several days. The directors met on Monday at the office of Anthony M. Brady, 54 Wall Street, and re-elected President Rossiter and the old executive officers without change. A statement given out shows the net receipts for ten months operation in 1900 to have been \$2,235,904.69, an increase of \$450,548.93 over the previous year.

ELECTRICITY.

VOL. XX.

NEW YORK, FEBRUARY 6, 1901.

NO. 5.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	\$2.50
IN CLUBS OF FIVE OR MORE, - - -	2.00
FOREIGN COUNTRIES, - - - - -	4.50
SINGLE COPIES, - - - - -	10 cents

Remit by Express, Money Order, Draft, Post Office Order or
Registered Letter.

ADVERTISING RATES.

As *ELECTRICITY* reaches all classes interested in electrical
work, its value as an advertising medium can be readily un-
derstood. Rates will be sent on application.

Changes of advertisements should reach the office not later
than the Saturday preceding the day of publication.

EDITORIAL NOTES.

Prof. Pupin Has an Alleged Rival.

There is hardly ever an invention of any importance brought out, but what some one springs up to claim a prior conception of the idea and device. This has been the case with Edison's ore milling process and innumerable other valuable devices by well-known men. Just because a man happens to think in a general way that electricity might with advantage be applied to doing so and so, and never acts on his thought, and several years later the very idea, which he cherished in idleness and as being solely his, is enlarged and perfected by another party who has probably spent months and much money in so doing, it by no means follows that the credit of the invention should be taken from the real inventor and given the dreamer. And yet in nine cases out of ten the latter feels aggrieved unless this is done.

Some six months ago Prof. Pupin, of Columbia University, described at a meeting of electrical engineers an invention which he had made, and which would allow of vocal messages being transmitted along a submarine cable over distances heretofore prohibitive. How he achieves this—doing away with induction and condensation—has been explained many times in the technical press of late, but in a word it is accomplished by inserting specially devised induction coils at frequent intervals in the cable. Recently the rights to this method of telephony were sold to the American Bell Telephone Company for half a million dollars, whereupon a resident of Chicago comes forward and claims priority of invention. This gentleman, according to a Chicago daily paper, asserts that he perfected a similar system, and tested it two years ago. It is also alleged that he conceived the idea twelve years ago. Referring to this subject he is reported as saying: "My invention consists of a system of inserted relays 200 miles apart, whereby I can by the use of ordinary telegraphic wires now in use communicate to any distance articulate sounds—that is, words. I do not know the details of Pupin's invention, but I do know that he requires more relays than I do."

Thus the chances are there may be a long-drawn out suit in the near future—as the Chicago gentleman proposes to begin an action—which will benefit no one but the lawyers, and

which may possibly prevent the public from receiving the benefits of the device as soon as it would otherwise. If the Western inventor considered that Prof. Pupin's system infringed on his, why did he not come forward months ago and say so, rather than wait until the eleventh hour before taking any action?

Some Wonderful Ideas.

The dawn of the new century is apparently deemed a fitting time by inventors and scientists to bring forward startling theories and to utter preposterous statements which are eagerly sought after by the daily papers, and served up by them to the unsophisticated public with voluminous illustrated trimmings.

Not long ago our friend Nikola Tesla allowed himself to be heard from again, and informed a representative of the press that while experimenting in wireless telegraphy in Colorado, his receiving instrument responded to extraneous electrical vibrations or signals, which Mr. Tesla, with his usual vivid imagination, immediately concluded came from the planet Mars. Less enthusiastic scientists think the signals referred to were due to local electrical disturbances in the atmosphere. That such is the case would seem probable, for admitting that Mars is inhabited by intelligent human beings, is it likely that we have reached the same stage of development that they have, or vice versa; or that the Martians are making use of electrical vibrations, rather than some other force of which we at present know nothing, to attract our attention, assuming of course that the residents of Mars do think of us, which it is barely possible is not the case. So much for the Mars sensation.

To send coal by wireless telegraphy is another one of the wonderful ideas that seem to have been born with the new century. A doctor of Chicago states—in a daily paper of course—that within a very short space of time it will be possible, after reducing coal into a gaseous form, to send it through the air on a wireless electric circuit, to be reduced at the place of destination to a solid, and to be sold as coal with the original qualities of the product as dug from the mines. How the learned doctor proposes to accomplish this is not definitely stated, but it is understood that electrolysis is expected to play an important part in the operation. Incidentally it might be pointed out, that were Nikola Tesla and the Chicago doctor to go into partnership they might control and

corner the coal supply of the world—which is growing less—by importing coal from Mars on etherial waves.

There is not the slightest doubt but what the world is progressing, and that schemes that would have seemed visionary to our great grandfathers are in practical operation to-day, but these changes have come gradually and not by starts and jumps. Nikola Tesla is unquestionably a great scientist with a wonderful mind, but as an engineer put it recently, when referring to him, he is one or two hundred years ahead of his time.

* * *

England Worrying About Its Trade.

Apparently the English press is stirring things up on the subject of the decline of British trade. The daily papers

are harping on the subject in a more or less discouraging vein, which has forced the technical press to take up the matter in an effort to defend and encourage the home manufacturers of electrical machinery and apparatus. The "Electrical Review" of London objects to the statement made recently by Mr. Alfred C. Harmsworth regarding the excellent outlook in England for American made automobiles and trolley cars, while in "Feilden's Magazine" there appears an editorial which among other things says:

"Signs, however, are not wanting to lead us to believe that the war against apathy, unsatisfactory and superficial as it perhaps has been, has not been without results in effecting a stimulus to some portion of Britain's manufacturers, as the adoption of the bonus system and the purchase of up-to-date tools, which are putting the more progressive firms a long way on the road towards attaining an increased output, will testify.

"English tool makers themselves have been awakened more particularly by actual stress of foreign competition to the necessity of modernizing their products, and the golden harvest reaped by American tool makers in this country for years past, instead of perhaps proving what at first appeared to be a very unfortunate circumstance, may be in a measure condoned in that our own tool makers have been enabled thereby to benefit largely from the American models."

This article, after admitting that the British tool manufacturer has been obliged to adopt American models, states that the above mentioned magazine has taken the trouble to dispatch a commissioner to the United States, who will visit the chief industrial centers in this country with a view to ascertaining why, to put it in plain language, the machinery manufactured in Great Britain cannot as a rule successfully compete with that made on this side of the Atlantic. Referring to the subjects the commissioner will investigate the editorial says:

"Among his general instructions, one of the chief is that which relates to the question of comparative productivity, that is, in other terms, the return upon invested manufacturing capital. It may be stated that the industrial product of every hundred pounds invested is very much higher in the United States, where it is the common aim of the men to work every machine up to its highest standard of production, than it is in this country.

"It is evident that the question of labor and the conditions of labor prevailing in the United States, compared with the trades unions of

this country, is an all-important element in this question, and our representative has instructions to give the values, speeds and products of machinery his principal attention."

It is only natural that English publications should take a just pride in upholding the products of home manufacturers, but this does not alter the fact that American electrical apparatus and kindred machinery is steadily gaining a foothold in that country in spite of anything the British manufacturers have been able to do. And this will continue to be the case as years go by, and our exports to that country will grow larger rather than smaller, as the immense aggregation of capital at the command of our larger manufacturers permits them to immediately relegate to the scrap heap out-of-date machinery and tools to be replaced by utensils of the most modern pattern. Thus is it possible to turn out and market first-class machinery at a minimum price. The report of "Feilden's" special commissioner should prove interesting reading.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE Municipality of Berlin has just paid 10,000,000 marks for the Siemens-Halske tramway, the most important street railroad system in the German capital. The Prussian Government is preparing to run electric railroad trains at 25 miles an hour.

THE 21st meeting of the New York Electrical Society was held on January 30 at the Edison Station of the New York Gas, Electric Light, Heat & Power Company. Dr. Louis Bell delivered a lengthy lecture, entitled "Electric Illumination at the Beginning of the Twentieth Century," an abstract of which will be found elsewhere in this issue. The meeting was unusually well attended and after the lecture a most appetizing collation was served. The 212th meeting of the Society will be held at the College of the City of New York, 23d street and Lexington avenue, on Thursday, February 14, at 8 P. M. Mr. Kempster B. Miller, whose writings on the subject of telephony have made him the foremost exponent of the art in this country in technical literature, will address the Society on "Modern Telephone Engineering." This will be the first lecture on telephony which has been delivered in New York City in many years, and will constitute a most important review of the engineering situation.

As a result of a brief interview had with Mr. C. O. Baker of Baker & Company relative to the situation of the platinum market, we learn that platinum has never been so high as at the present time, this notwithstanding the fact that the demand has never been greater. All indications, as a result of this condition, point to an early and substantial increase in the present quotations.

It is stated that electric power from the Niagara River is to play a part in agriculture in that region. A power company has contracted with several farmers to run transmission lines to their farms, and it is the intention of the farmers to place electric fans over their peach trees and run them at night. It is claimed a circulation of air will prevent frost and that orchard owners in Delaware have made similar ex-

periments with success. The saving of a peach crop from frosts, early or late in the season, is worth a great deal to the orchard owner; it means the rescue from loss of all the rest of the season's work. If power is cheap and ready and the application of it is efficacious, the idea may have merit.

A MAINE man is said to have invented an auto sled, which presents some departures from the previous lines of experiment. The sled is to be 10 feet long, about 3 feet high and somewhat more than 4 feet wide.

PROF. A. SLABY of the "Berlin Technische Hochschule," in the course of a remarkable interview on "The Coming Electrical Revolution," asserts that his recent invention, multiplex wireless telegraphy, will produce a great transformation in existing methods. It will be possible, he declares, to apply the principle to submarine cables in such a way as to send hundreds, and even thousands, of messages simultaneously on the same wire, thus enormously cheapening rates. Prof. Slaby believes that the problem of direct production of electricity from coal will be solved. Germany, he predicts, will be the foremost nation of the twentieth century in technical production and electricity will be the poor man's source of power and light. He is confident of the success of the electrical express locomotives now being constructed in Berlin for a speed of 200 kilometers an hour.

AN enterprising man in Buffalo, N. Y., has rented a large tract of vacant property near the Exposition grounds, on which he proposes to erect several hundred substantial tents. These will be of different sizes and will be rented by the week at rates which can only be considered most reasonable, when they are compared with the prices that hotels will naturally charge. Arrangements may be made to light these tents by electricity and also to use the heating power in electric ranges for culinary purposes.

AN automatic electric fire alarm has recently been invented by Dr. W. Jay Brewster of Port Ewen, N. Y. The invention consists of a plurality of thermostats, one of which is placed in each room of a building; an alarm bell is also placed in each room. The thermostats are in open cases or boxes, which are 6½ inches long, 2½ inches wide and one inch deep. Connecting with a thermostat and extending from it around the entire room is a small metallic perforated tube, which is secured in a depression of the base or mop-board. Inclosed within this tube is a compound which is extremely sensitive to the influence of fire. This, as will be seen, makes a continuous thermostat reaching from the central thermostat case to all parts of the room. In each room so equipped the thermostat case is in electrical communication with the alarm bells of each and every other room of the building and with an annunciator which may be placed in any room desired. In a building thus equipped, should a fire occur in any part of any room, instantly a general alarm is sounded in every room of the building and the annunciator will show the number of the room in which the fire has occurred.

THE cost of a horse power per hour, in different sorts of motors, has been studied by M. Charvet, says the N. Y. "Sun." Some of his results are of general interest. A French laborer working eight hours in turning a crank

at a wage of about 70 cents per day produces one horse power hour at a cost of 85 cents. An ox turning a horizontal bar 13 feet long (as in some grinding mills) produces the unit at a cost of 23 cents. A horse doing the same kind of work travels much faster than the ox, and the unit of work costs a little less than 20 cents. A six horse power steam engine (working 150 days each year and ten hours per day—as is customary in farm work) produces the unit of work at a cost of about 4 cents. The petroleum engine is considerably more economical in operation, but its work in France costs about 7 cents on account of customs duties. The wind-mill produces its unit of work at 2 cents, but the most economical form of motor is the water wheel. A water wheel whose first cost is about \$160 per horse power produces a unit of work at a cost of less than 1 cent, and turbine wheels are even more economical.

FLORIDA is to be connected with Cuba by an undersea telephone line. The termini of the line have not been announced but it is stated that the Bell Telephone Company has determined to construct it, applying the invention of Dr. Michael I. Pupin, from whom the company recently purchased it.

Two electrical furnaces have been installed in the physical chemistry department of McGill University, Montreal, through the aid of which many interesting experiments can be made. The furnaces have a capacity of 110 volts, and are large enough to take a current of 100 amperes. The principal use to which these furnaces, with their immense heat of 3,000 or 4,000 degrees centigrade are to be put is the splitting up of compound substances into their component parts, with most important results for commercial purposes. They will also be used for the manufacture of diamonds, a process discovered by M. Moissan, the famous French chemist. The study of the diamond fields of South Africa convinced him that great heat and great pressure has been the agents that turned carbon into the diamond. He therefore fused in the electric furnace carbon and iron at enormous heat, and then cooled the compound off rapidly, thus subjecting the carbon, mixed with it, to a terrific pressure, resulting in the formation of true diamonds, answering all the tests of the natural gem. The artificial product is as yet, owing to size, of no more than scientific value.

The new electric railway at Paris has proved a great success, despite the mishaps that have occurred thereon from time to time. From the date of its opening on July 19, until October 31, 13,000,000 passengers were carried. Occasionally the daily number of passengers carried amounted to 170,000. It was originally intended to run only 270 trains per day, but this number has been considerably increased, and further trains are to be added.

THE Dominion Government will propose to Parliament on an early date the purchase of the Canadian Pacific Railway telegraph lines, also the lines of the Great Northwestern Telegraph Company, and operate the whole as a part of the Post Office work, just as is done in Great Britain. The purchase money is calculated to reach \$25,000,000 or over, but as the two concerns duplicate in almost all centers of the Dominion, the Government can count on reducing working expenses by almost one-half. The legislation will provide for one of the

chief officers of the British Government Service acting as arbitrator in case of differences as to prices. Under any circumstances the shareholders will be amply protected. The chief inducement for the proposal is to secure a British and Colonial Government line round the world, and the scheme will be greatly favored in Britain.

THE chimes of St. Patrick's Cathedral, in this city, consist of 19 bells, ranging in weight from 270 to 6,000 pounds, and having a musical range from lower "C" to upper "D," with the accompanying sharps and flats. For the ringing of these bells the plan decided upon comprises a keyboard about 18 inches long, fashioned like that of a typewriter, to be placed in the sacristy. This may be operated with ease by anyone having a knowledge of music. In addition there is an automatic clock mechanism which is to render the "Angelus" and the "De Profundis" four times daily. In adapting the switch-signal system to bell ringing, 19 bell engines, corresponding to the number of bells, were constructed. These bell engines are bolted to wooden seats, which in turn are bolted on a system of steel beams inserted in the walls of the north tower. These engines consist in their working parts of a fine grade of bronze composition metal, so as not to rust or corrode. The engines practically consist of three main parts, two cylinders and a piston, which is fitted to a clip hung on the clapper of the bell above it. On the engine there is an adjustable clevis, so that the stroke can be arranged to a nicety, and once so adjusted it cannot change its position. The engines are operated from the sacristy by means of a keyboard. A key being depressed, a current of electricity is sent along its wire to the belfry, where, by means of an air-valve operated through an electro-magnet, the compressed air is admitted to the bell engine, and the air pressure delivers the blow, which acts upon the clapper and rings the bell.

A CABLE dispatch from France states that during the recent heavy snow storm in Paris many serious accidents occurred in connection with the surface contact system of electrical propulsion in use on the Rue Quatre Septembre. Owing to the pressure of so much moisture, the studs in the middle of the track, usually harmless, were charged with current, with the result that when a person placed one foot on a rail and the other on a stud he received a shock.

SOME time ago we referred in a short item to the fact that in Germany it was proposed to use peat as a fuel for generating electricity. The "Electrical Engineer," London, now states that the matter has been fully considered by Dr. Franks, and he estimates that a hectare of turf 3 millimeters thick gives 2,500 tons of dry turf, equivalent to 1,200 tons of coke, or, in English measure, an acre of turf 10 feet thick gives 1,000 tons of dry turf equivalent to 480 tons of coke. The mosses of the Evus Valley, which cover an area of 1,000 square miles, might furnish the equivalent of 300,000,000 tons of pit coal—that is to say, more than the total production of Germany for three years. The turf would be burnt at central stations of 10,000 hp. capacity, consuming annually 200,000 tons of turf, the product of 200 acres of the beds. One application of the power produced would be to the service of the canal connecting Dortmund to the Ems, which will soon be finished, but the

writer thinks the most interesting will be the manufacture of acetylene, the materials for which can be obtained easily and cheaply in the neighborhood. With 10,000 hp. a quantity of acetylene can be produced daily equivalent for lighting purposes to 150,000 gallons of petroleum, or annually in value to 20,000 tons of foreign imported petroleum.

AMERICAN engineers according to a daily paper have secured the contract for the equipment of the first electric road in the city of Tokio, Japan. A. L. Bagnall, of the American engineering firm of Bagnall & Hilles, of Yokohama, Singapore and Manila, which concern has been awarded the contract, is now in New York for the purpose of placing orders aggregating \$300,000. Of the contracts already let New York concerns have secured orders amounting to \$150,000. Referring to the project he says: "The road, which is to be called the Tokio Electric Railway will be thirty-five miles long. The system is to be operated through the principal thoroughfares of Tokio on to Kawasaki; nine miles distant, in the direction of Yokohama. It is proposed to connect Tokio with Yokohama, a distance of twenty miles. According to the specifications drawn up by the Japanese officials, it was specially stipulated that the car bodies and trolley poles were to be made in Japan; also that Cammell rails and Babcock & Wilcox boilers must be supplied. In the open market such contracts would most assuredly have been placed in the United States."

IN Norway, as in Sweden, at present there is a great deal of agitation for the working of short-distance railways by electricity, the power being obtainable from the numerous waterfalls in both countries. In many towns, according to the London "Electrician," the tramways are already worked by this force generated by accumulators. However, the first railway line in Norway to be worked by water and electric power will be that from the town of Holmestrand on the Christiana Fjord to the Villingfos, a beautiful waterfall much visited by tourists. The line is to have a length of 25 miles, and will be ready for traffic next summer. There is already a generating station at the fall. A second electric line will be that from the town of Fredrikshald to the Tiste River, to be worked with a large single car driven by electromotors.

THE well-known French astronomer and writer, M. Camille Flammarion, has for some time been making a special study of the effects of lightning on men, animals and other objects, and in order to illustrate the freakish conduct of lightning he recently told some stories which seem incredible. Thus he tells of two peasants who were preparing to eat breakfast, when suddenly all of the dishes were thrown on the ground, the bread, cheese and fruit vanished from the table and they themselves were covered with straw. On another occasion a man, walking through Nantes, was enveloped in lightning, yet was not injured. When he reached home, however, and opened his purse, which had contained two pieces of silver and one of gold, he found that the gold piece had vanished and that in its place was a silver piece. The lightning had, in fact, pierced through the leather of the purse and had covered the gold piece with a coating of silver taken from the other two pieces.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 13.

THE THREE-WIRE SYSTEM.

One of the principal objects to be attained in installing an electric light plant is to secure the required efficiency at the least possible expense in copper for carrying capacity.

When incandescent electric light was first introduced the tremendous cost for copper for distribution, even in small cities, was the greatest retarding feature to the industry, and the engineers at once directed their attention to devising systems whereby a reduction in the amount of copper necessary could be secured and at the same time attain as great a lighting capacity. One of the results was the three-wire system of distribution.

There is always a loss of pressure in an electric current when it flows through a conductor, the loss being equal to the product of the resistance of the wire and of the amperes of current. Then when a number of incandescent lamps are fed from a circuit at a considerable distance from the supplying source, the wires of the circuit must naturally be quite heavy in order that the loss in pressure shall not be too great.

On an incandescent lighting circuit it is common to allow a loss of pressure or "drop" amounting to as much as 10 per cent., and sometimes even as high as 20 per cent. when working at its full capacity. The circuit should be arranged so that all the lamps on it shall be fed with current at as near a uniform pressure as possible, and if the drop allowed is too great this becomes a difficult matter on account of the continual change in the amount of current flowing as a result of lamps and motors being turned on and off the circuits.

If the voltage at the central station or supplying source can be increased then the amount of current required to accomplish an equal amount of work will be proportionately decreased, and as a result a greater amount of work can be done over the feeders and distributing lines of the system, or, in other words, the carrying capacity of the system can be proportionately increased as the amount of current required to do a certain amount of work is decreased, still maintaining an equal efficiency to the plant.

But to increase the voltage above a certain point on a multiple incandescent lighting system is not practical. First, because it has been discovered that incandescent lamps do not have as long a life when manufactured to operate at a higher pressure than 110 or 115 volts; second, there are too many objections to using high voltage on interior wiring.

If on a circuit of 110 volts pressure there are operating ten 16 cp. incandescent lamps, the amount of current that would be flowing over the circuit would be practically five amperes. Suppose the circuit were operated at 220 volts, and the lamps were connected two in series and a multiple of five, as in Fig. 1, then the amount of current flowing would only be two and one half amperes and we would be able to operate just twice as many lamps on the cir-

cuit with the same carrying capacity; but here we would meet with a serious objection because the lamps would have to be used two at a time or a multiple of two and also if one lamp burned out the other one in its circuit would not operate. This would not be a very convenient arrangement.

FIG. 1.

One way of securing the 220 volts pressure would be to connect two 110 volt dynamos in series. Suppose that were done, but instead of just using the two outside wires in feeding the circuit, the center or connecting wire is also run out, making three wires in the operating circuit, as in Fig. 2.

You will observe that this is practically operating two distinct circuits except that one of the conductors is made common to both circuits. This common conductor is known as the neutral wire.

Referring to Fig. 2, let us observe what advantages may be derived by operating in this manner. If each dynamo were operated at a pressure of 110 volts, then between the conductors A and C there would exist a pressure of 220 volts and between A and B or C and B there would exist only a pressure of 110 volts.

The conductor B would be negative to the circuit A B, and positive to the circuit B C. Now if ten 16 cp. lamps are connected in each of the circuits as described in the figure, then the system would be what is known as balanced, that is, there would be no current flowing in either direction in the conductor B and the lamps would operate just the same if the conductor B were disconnected entirely from the dynamos. You will readily see how this is, because if 10 lamps are operating on each circuit there will be five amperes tending to flow back on the conductor B to the dynamos and also five amperes tending to flow out on B, because, as we said before, the conductor B is positive

FIG. 2.

to one circuit and negative to the other circuit. If this condition exists then there will be no current flowing in the conductor B and the current flowing through the lamps on one side will also flow through the lamps on the other side. The ammeters on the lines A and C would read the same and the ammeter on B would remain at zero.

Suppose there are twenty lamps operating on the circuit A B and only ten on the circuit B C, then there would be 10 amperes tending to flow back on the conductor B and only 5 amperes tending to flow out on it. So if we have a plus ten and a minus five the actual current flowing in B would be five, or just equal to the difference in the current used in each circuit or side of the system.

Now we see the function performed by the neutral conductor. It takes up the difference between the two circuits if they are not balanced, and the ammeter on that circuit will show the amount of difference or unbalance, and the reading of it should be exactly equal to the difference between the readings of the ammeters on A and C.

This is a very popular method of operating and exercises quite a saving in copper in a plant, for while using 110 volt lamps on the circuit yet it is practically operating at 220 volts pressure and as the pressure is increased the amount of current required to do an equal amount of work will be proportionately decreased and consequently a less carrying capacity in the conductors be required to accomplish an equal amount of work.

Article No. 14 will be entitled "Alternating Currents."

THE TRADE EDUCATION OF CENTRAL STATION EMPLOYEES.*

(Concluded from page 58)

WHAT A CENTRAL STATION COURSE OUGHT TO CONTAIN.

Your committee has endeavored to do the utmost justice in its examination of each of the schools. It approves the idea of correspondence instruction as being an excellent one in its place; it believes that good is coming from the correspondence schools; and it has satisfied itself that the administrative methods of the schools are reasonably well planned. Each of the courses, however, which belong to the second and third categories named previously, can and must be greatly altered before they are adapted to be of the greatest use to central station employees and through them to their employers. The ideal central station course should contain very much less of "design" and much more relating to good construction and economies in operation. Your committee here outlines a course which it believes would meet the requirements of the average central station employee, and which would result in great advantage to the central stations if the employees followed it.

COMMITTEE'S COURSE.

1. Arithmetic (for those who need it).
2. A small amount of elementary algebra, geometry and trigonometry.
3. Erection and use of steam boilers.
4. Fuel and its economical combustion.
5. Boiler operation and boiler tests (this should include the methods and reasons for testing flue gases, testing the quality of steam, the use of feed water heaters, economizers, etc.).
6. Erection and operation of steam engines.
7. Testing of steam engines (this should include use of the indicator, testing to determine friction, the consumption of water per indicated horse power per hour, valve testing etc.).

* Abstract of a report of the Committee of the Northwestern Electrical Association, appointed to consider the advisability of central station managements encouraging their employees to enroll themselves in courses of correspondence schools.

8. Condensers, pumps and other auxiliaries.
9. Steam piping and steam pipe covering.
10. Ohm's Law and electro magnetic theory (this would include electrical instruments, flow of currents, etc.).
11. Erection, operation and repairs of direct current electrical machinery.
12. Elementary theory of alternating currents (single phase and polyphase).
13. Erection, operation and repairs of alternating current machinery.
14. Switchboards and switchboard instruments.
15. Electrical transmission and distribution lines and accessories.
16. Construction, testing and repairs of pole line and underground circuits.
17. Meters and meter repairs.
18. Electric lamps.
19. Station economies and station records.
20. Transmission and distribution economies and distribution records.
21. Storage batteries and their uses.
22. Telephones and their accessories.

Theorems of applied mechanics, strength of materials and other related subjects are to be suitably treated at points of application.

A properly written course of lessons following this outline should take an industrious employe about one and one-half years to cover the ground. Such a man should be expected to spend perhaps six hours of study each week outside of the working period. The course could be successfully administered in the system of existing correspondence schools. The course aims at producing in the corps of employes a working knowledge of the means for obtaining the highest possible economy available from the machinery and appliances installed by the central station company, and the possibility of improving the economy by minor alterations. This course would surely be successful in its aim, and it would result in great improvement in the character of the work of employes of the average central station company, if followed by them, and through them in advantage to the company.

The answer to the interrogatory of the second head has been outlined. The administrative methods of existing correspondence schools will give excellent results when combined with a properly adapted course, such as that outlined by the committee, but the existing courses of the schools are not fully and properly adapted to average central station requirements.

THIRD HEAD.

What Provisions May Central Station Owners Reasonably Supply for the Purpose of Encouraging Their Employes to Study the Requirements of their Business and How May Those Provisions be Executed?

Your committee is firmly convinced that the central station companies can lend their employes great assistance by providing a perfectly adapted course of correspondence instruction. It is probable that one or more of the existing correspondence schools will arrange such a course if its need is made known through action of this Association. In the administration of this course it is desirable to add to the processes now made a part of the electrical course some means for practical demonstration of central station methods. The demonstrations should relate particularly to the methods of firing coal, testing flue gases testing the quality of steam, indicating engines etc. Analogous demonstrations are made to railroad employes by the International Correspond-

ence Schools through traveling instruction cars which carry complete outfits of air brakes and other train devices. That which can be done for railway employes can be done for central station employes, and the central stations should make every effort to bring before their employes complete instruction that is the equal in its kind to the instruction offered to railway employes by the International Correspondence Schools.

Prizes, free payments of scholarship fees, and other provisions for encouraging the employes to enter correspondence courses do not hold out reasonable advantages except in a few individual cases. Personal encouragement of the ambitious men who are well endowed with common sense, and the provision of a suitably planned and administered course of instruction which such employes may enter upon, will bring the greatest advantage to the central station companies. It is on these lines that the central station companies must look in large degree for the improvement of their operating conditions.

The required course with its administration can either be had through one or more of the correspondence schools as suggested by the committee or through a subscription fund administered after the manner of the "Gas Educational Fund" of the American Gas Light Association.

Your committee recommends that action be taken requesting the correspondence schools to organize and administer a course of instruction for central station employes which conforms to the recommendations of this committee; and that the committee be continued for further investigation of the results obtained through correspondence instruction.

Respectfully submitted by the Committee,
DUGALD C. JACKSON, Chairman,
Member of the N. W. Elec. Assn., Professor of
Electrical Engineering in the University of
Wisconsin.

F. A. COPELAND,
Ex-President of the N. W. Elec. Assn., President of the La Crosse Edison Light & Power Company.

HENRY L. DOHERTY,
Ex-President of the N. W. Elec. Assn., President of the Madison Gas and Electric Co.

DISCUSSION.

H. J. Gille, St. Paul, Minn.—I move that a vote of thanks be extended to Prof. Jackson and the other members of his committee for the very able paper, and that the committee be continued.

The motion was carried.

By unanimous vote, the recommendations of the committee were adopted.

Prof. Jackson, Madison, Wis.—I move that the four correspondence schools referred to in the report be individually requested to reorganize their courses for central station employes, to conform, as nearly as possible, with the requirements set forth in this report.

The motion was seconded and carried.

Mr. Bowen—I want to say that I am heartily in accord with the matter contained in this motion. Great difficulty has been found, as is indicated in this paper, in getting the specific education which is demanded of the employes in various processes. For instance, the cost of the manufacture of gas per thousand feet rests very largely with men generally without education, who operate the gas works, and it goes without question, I think, that the cost

per kw. at the switchboard rests very largely with the men who are operating electric plants. It is throwing a great deal on your committee to ask them to enter into further correspondence with these correspondence schools for the purpose of getting them to remodel their courses, and yet something must be done along that line, but you must not forget that you are burdening your committee. Your committee will be obliged to take the courses that are offered by the correspondence schools, after their revision, and see that they are right. There is no correspondence school that can educate a gas employe. We have found that out to our cost. But they can educate them along the general line, the principal one being just this, that each of the courses proposed by these correspondence schools takes up entirely too much time—in other words they ask these fellows that handle the shovel to study algebra—that is about the size of it. There is nothing in the way of practical education quite so good as sending a man right into the retort house or into the gas generating house to show him how to get the results, and when he gets through under good experienced tuition, he knows something, and much more than under the tuition of the correspondence schools; but a course should be arranged, so concise, so plain and so short and pertinent to the subject matter, that no mistake can be made. Now if this committee will go ahead and invite these schools to adopt courses recommended by the committee, it will be the best work ever done by a committee, and I hope that this committee will do this work and that the result will be what I think it will be if this present committee is continued.

Mr. Livermore—It is just possible that we central station managers would like very much to have all our men experts in their individual daily occupation. At the same time the general tenor of the correspondence school, while it includes arithmetic, algebra and trigonometry, is to elevate the men. If we want a man to become a perfect fireman we do not want to lose him, but to have him stay there, and my idea of the correspondence school scheme of education, is to take a poor fellow who never had any chance to go to school, but had to go to firing when he was 15 or 16, and give him a chance to learn something during his spare hours, so that some day he may rise to be a superintendent. I know several such cases where men have moved rapidly up from lower to higher positions by the aid of these schools. I think some of the courses are too long, but some of them are comparatively short. They have a course for professional linemen and in side electric wiring men; and while it is not necessary to know algebra to be a fireman, yet the whole purpose of the course is to advance men. It is to advance the man who never had a chance when he was a boy to go to school, didn't have the money—the object of the whole thing is to start from the ground and build up.

Mr. Gille—It seems to me that the point brought out in this report, that the percentage of students that finish that course is very low indeed, would indicate that there is something wrong. There is quite a number of employes in my department who have started with this correspondence school—there are probably thirty who have started and only one that has finished—and I have inquired several times why this was. It was simply because they had to go over a lot of stuff they did not under-

stand and did not care anything about. They would jump through and pick out matters that interested them particularly, or that they believed would do them good, and it seems to me that the recommendations made by this committee are practical, that a man in whatever station he happens to be should have a future to look to, and he gets not only a general knowledge of the operation of the plant, but he gets a very good idea as to the machinery itself and the system.

Mr. Almer—In connection with this matter, if it is in order, I want to state an experience I had about a year ago. I took the lesson leaves of probably the first correspondence school that came out—it is not in existence now—and took all the primers, inspectors, and wiremen that I had and gave them these leaves to read from, and once a week all through the winter I held a little lecture, and went over these lesson leaves and explained them, and asked the men questions, and the result was that I obtained very much better work from the men, but I have only one of those men left, and he has advanced three or four points. The others have found better positions elsewhere. So I have the same task to do over again.

Mr. Cutter—The remarks of the last speaker interest me immensely. It proves the value of the course. The paper itself is rather a surprise. We are proud to have had a committee to give such a report on this topic. We are proud that this Association is handling this important question of educating men to do their work better, and we are glad that committee has gotten it down to a practical basis. We all understand that the man that is running a dynamo and has some little trouble with it, he would like at that particular time to know what the mischief is the trouble. He does not want to go through a long course of algebra or trigonometry to do that. It seems to me that the suggestion of the committee is especially pat. Of course I would like to see some method by which the employes of the stations could ask questions pertaining to their business, from the correspondence schools if possible. If not, I would like to see some method introduced by which those employes could ask questions from a source where they could receive correct information at the time that particular point of interest is before them. I would also like to see the central station managers encouraging their employes to take up such a course, especially after it has received the stamp of approval of such an able committee as we have on this matter.

Mr. W. L. Elliott, Chicago—I never said a word in this Association before, but it seems to me that the education should begin with the head of the house, the man who is more liable to stay there than the fireman. The idea of the committee is perfect and should be adopted, but in our house we are pulling 100 percent more load than we were two years ago and at a less cost. Let the head of the house take the full course and hold his own class. Then the station pays the expenses and the employe gets the advantages free, and the proprietor should always be willing to advance the interests of his own men.

Mr. Ben Strong—The gentleman suggested that he had lost his employes—I guess it was because they learned too much to stay with him—I mean that they learned so much that they went off and secured a better job. Some other station man probably benefited at your expense.

PRACTICAL LINE CONSTRUCTION.*

BY LOREN W. BURCH.

This is a subject that should have been given a more fluent writer. How to construct a pole line correctly has undoubtedly agitated many minds before now. In the early stages of construction a great amount of groping and feeling in the dark was indulged in and when we see some of the work that is done to day it looks as though daylight had not yet come for some of us. Pole line construction has permitted a vast amount of fanciful ideas, emanating from the minds of those therein engaged, because no specifications have as yet been produced to form a standard which could be followed with success.

The importance of good line construction is made apparent by the increased expenditures caused by a poorly constructed line. It may be that a line repair account is not kept; under such circumstances it is possible that the line itself is not kept in proper repair. Keeping the line in good condition and keeping a strict account of the same should go hand in hand. A line poorly constructed means a waste in dividends; money spent for repairs on work originally badly done, that should have entered into the first cost, is worse than money thrown away. To construct a first class pole line at the start is to save money and give character and stability to the line and increased value to your property. It will also inspire confidence in your customers and bring forth words of praise that mean business for the plant.

There are three great evils which are always at work doing their best to defy success in almost all kinds of construction. In pole line work we find first, ignorance; second, false economy; third, dishonest contractors. No matter how good a standard you might have, any of these elements is enough to work sad ruin to an investment of this nature. As regards pole line construction, where will we begin? I would suggest with the pole. We experienced little or no trouble in getting good, dry, live cedar poles, that are graded to a standard set up by the pole dealers.

The pole should be well peeled, dressed up, housed and gained. One, two or even more extra gains should be cut while the pole is down, as it is much easier and more cheaply done on the ground. We will not go into details of setting poles, in this paper, but suffice it to say that a pole well set and tamped is half guyed. No matter how good your poles may be or how straight the line is in which they are set, if they are not properly guyed, you will have a poor piece of work on your hands when through. It is safe to say that a properly guyed pole line will enhance its value fully fifty per cent.

I do not advocate the use of the so-called hand-made guys, as, to make a stranded guy is a difficult task for men to perform and get each strand of equal tension. Machine twisted guys are cheaper, stronger, and more easily handled. Guy clamps should be used in all cases, as it permits of coming up with the end and taking the slack out of a guy, if necessary, without cutting it. Guy rods are better than ungainly looking posts and should be used wherever possible. All guy wires should be fitted with circuit breakers, placed at a distance of 6 to 8 feet from the pole end to prevent accidents and grounding from live guy

wires. Guying to trees, buildings, etc., should be avoided entirely as other people's property is not yours and you cannot make it so by making fast to it in this manner.

In the construction of the ordinary plant the subject of guying is an after consideration and if a guy is put up one end is made fast to the pole and the other to some man's house, barn or tree. This is bad practice, even if the permission of the owner is granted, as the ownership of these buildings may be changed at any time. Special attention should be paid to all corner, junction and end poles or there will be no end of trouble when you commence to pull up your wire.

In digging holes it is immaterial whether you commence at the top and work down or at the bottom and work up. To dig the hole in the shortest possible time is the object in view and the nature of soil will always dictate the mode of procedure and tools to be used. The important part of the hole is the filling of it. Dry, loose dirt and rock, well, exceedingly well, tamped, will always hold a pole in place.

Cross arms are made in standard sizes and spacings of not less than 18 inch centers and 17 inches between pins, should be used on all lines carrying a thousand or two thousand volts. Cross arms should be doubled on all corner, junction or end poles. On 6 and 8 pin arms 9-16x9 inch lag screws should be used and not less than 1x14x26-inch cross-arm braces. Some superintendents insist upon having galvanized iron throughout; this is undoubtedly all right, but it is not absolutely necessary in all cases. It depends upon the color the poles are painted. Cross arm braces should be used on all cross arms over three feet long and I would recommend their use on two pin arms if a heavy wire is carried upon them.

Good live oak pins are all right to use on straight runs or light wires, but on corner or junction poles locust pins should be used. On wires from eight to four naught it would be better construction to use iron pins to support the heavy strains put upon them.

The height of poles is a matter that should receive considerable attention. The matter of trimming trees has caused a great amount of trouble and annoyance to both property owners and station managers. We, who are engaged in the business, can see little or no reason why a person should protest at having their trees trimmed to allow the stringing of wires, without coming in contact with the limbs, but how would it be if we owned the trees and were interested in the building of other people's property? Undoubtedly we would object to having our trees trimmed or poles set in front of our premises, as much as they. In order to avoid trouble of this nature I would recommend the erection of poles high enough to bring the bottom wires well above the trees. This would, in a measure, remove the necessity of cutting trees and would at the same time insure a clear line free from grounds caused by wires cutting into the limbs which are left in the way.

Recent orders received by our local company in Madison compelled them to remove all poles and wires from the four streets bounding the Capitol Square. In order to do this the streets one block from the square were used for the new pole line. The trees on these streets were numerous and extremely large and tall and in order to get above them it became necessary to purchase unusually tall poles. Consequently poles were brought from Idaho, ranging from

*Paper read before the Northwestern Electrical Association Convention, held at Milwaukee, Wis., Jan. 16-18, 1901.

55 feet to 75 feet long with 7-inch to 10-inch tops. These poles are very straight and when painted make a pole line that is worth going to see and will undoubtedly stand the aging tests for years to come. Of course these poles cost money; it also costs money to trim trees and to keep them trimmed, so it is possible that in the end the long poles will cost no more than the shorter ones and when it becomes necessary to string an extra circuit your men will not have their attention diverted from their work by a man or woman with a shot-gun.

Stringing wires over buildings is bad practice, as you are liable to damage the roofs over which they pass. For instance, it is customary to build a horse to support a circuit which will be placed upon the roof and in time the water collects and rusts the tin under the legs. Leaks result and water causes damage to building and merchandise and the owner brings suit. This would not happen if all wires are carried on poles owned by the company. A few weeks ago the writer had occasion to visit the roofs of some of our stores and the sight was amazing. Some of the roofs were crossed and re-crossed by a score or more of telephone wires. On account of the electric light circuit being entirely new in the district visited its wires were found to be in excellent condition. The poles being tall and new made it a good substantial piece of property. However, in some instances, service wires are run too low and would thus interfere with the firemen in discharge of their duty. Of course these wires will have to be removed and this will cost money. When a service wire is to be run it would be well for the superintendent to visit the building and determine where and how it should be strung and thus be sure that it would not have to be removed on account of misjudgment.

Cross arming poles is a very particular part of the construction of a good pole line. Great care should be taken to see that the gains are not cut too large in the poles, thus allowing the cross arm to wobble. The lag screws should not be driven in only enough to give it a start but turned in the remainder of the way. Cross arms should be put on the side of the pole opposite the strain so that it will not be pulled off. In double cross arming, holes should be bored through the spacing blocks which should not vary in length from the thickness of the pole at the gain, so as to prevent bending the cross arm.

Arc lamp poles should be 40 feet long and at least 7 inch tops. These should be set with a 6 foot plank running edgewise under the top of the ground just far enough to be covered and square with the face of the pole, looking to the center of the square. This plank will greatly strengthen the pole and prevent its top coming over by the constant strain of the arc lamp. When an order is given to put up an arc lamp in the outlying districts it is customary to rush the work and get the lamp to burning. The quicker it burns the sooner it becomes a revenue. But how about the rush work. After the work is done it is found that the poles were not set in proper position. They are in or out of the proper line. It may not happen at the time the line is built, but a year or so afterward when it is brought to your attention by the mayor or aldermen.

It will then be found necessary to do a part of the work over again, which proves the old adage, that "Haste makes waste." In order to avoid this transplanting process, I would

suggest that the proper authority, the city engineer, for instance, be made to stake out where poles could be properly set. It is reasonable to infer that if a city gives a company a franchise to use its streets to set poles in, that it will furnish some one clothed with authority to designate the proper location for them, or at least define curb lines, corners, gutters, etc. It is also better in laying out new lines to run them with a view to getting future business and not always by the shortest and quickest route. Often it is possible to run into a neighborhood that will give you a few customers that you were not anticipating. An electric line running past a man's house sets him thinking when nothing else would. We have been able to secure business after the line was up from parties who were not anxious for the light but could not offer the absence of a pole line as an excuse for not wanting it. Whenever possible it is undoubtedly best to set poles on lot lines or run in alleys and feed to the rear of the stores and houses. The neatest service wires you can put up do not improve the looks of a good piece of architecture and a bad looking pole line makes a bad looking street. To much construction work is done simply for the time being and not with the demands of the future in view.

ELECTRIC ILLUMINATION.

[The following is a synopsis of a lecture delivered by Dr. Louis Bell on "Electrical Illumination at the Beginning of the Twentieth Century," at the station of the New York Gas, Electric Light, Heat and Power Company, Duane street, New York City, before the New York Electrical Society, on Wednesday, January 30, 1901.—ED.]

President T. C. Martin, of the New York Electrical Society, called the meeting to order, and introduced Mr. John W. Lieb, Jr. who, on behalf of the New York Gas and Electric Light, Heat and Power Company, bade the guests welcome, and introduced Dr. Louis Bell.

Dr. Bell.—Mr. President, ladies and gentlemen: It gives me great pleasure to be able to deliver the first address of the new century to a body which has done so much to cultivate and stimulate, interest in the electrical arts as the New York Electrical Society. It is particularly happy, perhaps, to speak of electric lighting in this place, which is, as one may say, the head center of lighting from the old times, and, moreover, the beginning of the twentieth century is a particularly fitting time, except for the prophet, to speak of electrical lighting, because it is to be hoped that during the current century we may have tremendous changes in the art, and when the twenty-first century dawns some of the things which I show you here to-night will have passed out of use and the rest be very much improved. We are proud of the progress which electric lighting has made, but cannot afford to shut our eyes to the beneficent changes that may come over the art.

I am going to try to speak to you to-night, not of the science of electric lighting, but rather of the art of electric illumination. The art has been as much neglected, perhaps, as the science has been cultivated. I do not propose to waste any time in explaining the doctrine of the electric current. I do not know very much about it, and I think my audience

knows practically what I do. I am going to take the current for granted, and take the appliances which we have for granted, and try to briefly explain what we can do with them, in the way of getting illumination which is, after all, the object for which the whole science of electric lighting has been developed.

To begin with, I find that there is generally a good deal of misconception as to what we want by artificial illumination. There are two radically different doctrines, one may say, although they have not been formulated as doctrines, with regard to electric lighting and to artificial illumination of all sorts. One is that when we do artificial lighting we must try to vie with nature herself, beat old Sol at his own game. The other recognizes some of the limitations which finite intelligence and finite resources have imposed upon us, and goes at the subject of illumination, not as rivaling the illuminants of nature, but merely as furnishing such amount of light as we actually need for some useful purpose.

At the present time I think it is safe to say that more illumination fails from being too bright than from not being bright enough. By too bright, I mean too intense, as I shall presently show. The eye is a very curious optical instrument. Von Helmholtz used to say it was one of the worst optical instruments with which he was acquainted; that if an instrument maker had sent him such an instrument so badly constructed with reference to all scientific principles as the human eye, he would send it back, with thanks. Nevertheless, it has one peculiarity, one power, which is the basis of all our attempts at artificial illumination, which makes it possible, practically, to get artificial illumination, and that is the human eye can work over a tremendous range of brightness and still do its work effectively. We can read in brilliant sunlight, or by the light of a single candle, with fair comfort in both cases, although the candle is nearer than the sunlight. It makes comparatively little difference whether we read by the light of one of these arc lights, or a single candle, so far as comfort goes. For other purposes the arc light is very valuable, but the eye itself gets along very comfortably even when the amount of light is considerably reduced. That comes from the expansibility of the iris of the eye, widening or narrowing the pupil, in accordance with the demands of the occasion.

Whatever the source of illumination, there are some fundamental principles we must not forget in trying to do artificial lighting. I think the first is that the source of lighting ought to be unobtrusive, and if you stop to think of it, that is the direction in which most artificial lighting errs. Instead of the source being unobtrusive, it is obtrusive, even unpleasantly so, and instead of helping the vision often hinders it, for the reason that a bright point of light in the field of vision causes the pupil to shut up and protect itself and lessens the amount of light entering the eye, so that one cannot see with anything like the convenience which the amount of light would indicate. Excessive brightness of a particular spot is a thing to be avoided in all illumination. That is the reason for globes enclosing the lamps. The eye sets itself as regards the width of the pupil, as regards the effective aperture through which light falls on the retina, approximately to suit the brightest point in the field of vision, and as a result of

that a very bright light dazzles the eye, and makes it extremely difficult to see objects which are not given bright illumination and causes trouble.

The intrinsic brilliancy of the arc light is the highest artificial brilliancy with which we have to deal. We have all the way from 20,000 or 30,000 to 50,000 candle power per square inch in some portions of a very bright arc. Some estimates have run as high as 100,000 candle power per square inch of radiant surface. The calcium light, with which we are familiar as a bright illuminant, has only 5,000 candle power to the square inch, while the ordinary incandescent light has only a matter of about 200 candle power to the square inch. And even that is too bright. If you will look at it intently for a moment, you will see, when it is out, that you will catch an after-image in the eye of that bright filament. The after-image is a symptom of what may be serious effects on the eye if long continued. As a result, one can safely say that even the ordinary incandescent lamp, valuable as it is as an illuminant, is intrinsically too bright to yield entirely satisfactory results.

Another fundamental point in illumination, which is sometimes forgotten, and which is really important, is its direction. One would suppose at first that it would not make any particular difference what way light fell upon an object which is to be illuminated, whether you obtained it horizontally from the side, from below or from above, yet, in point of fact, it has been found by long experience that light from above is much more useful than light from the side, or, particularly, from below. I suppose this is due to the fact that the eye through the many centuries of its development in man has become habituated to getting sunlight from above rather than light from below. It is a well established fact that light which comes from an abnormal direction into the eye is sure to produce fatigue in one way or the other. For example, light reflected from snow is peculiarly severe and often produces a species of inflammation resulting in snow blindness.

The foregoing leads me to mention the value of diffused lighting. Anything like diffusion of light means there will not be any one particular point which is very brilliant. The brilliancy will be rather moderate. At the same time an enormous amount of light can be successfully diffused in practice, and on diffusion we depend for some of the most valuable results in illumination. You can easily get an idea of the amount of the diffused light in a room by a simple experiment, that is, by turning out the lights which are available and then shielding yourself from the only source of light which you have left, and you will find in spite of being in the shadow considerable light will still be manifest all about you. The amount of light which can be diffused in that way is large indeed, large enough to be a perceptible factor in all our attempts at illumination. In fact, a room with white walls will give two or three times the effective illumination, with the same radiant, as a room which is painted in dark colors. A white painted surface is the very best diffuser of light. A white surface will diffuse from 60 to 80 per cent. of the light which falls upon it. The light shades, of yellow almost as much. The distinctly yellow shades are admirable for diffusing light. Then come the shades of red and orange of various kinds. Then come the light blues, and last of all the very deep blues and the

greens. A dark green is perhaps the worst diffusing surface that can possibly be found. A room as light in color as this can be successfully lighted by diffusion alone, where there is no direct radiation falling upon the eye at all. Sometimes it is a very excellent scheme to avoid too brilliant radiance, also to get a correct direction for the illumination, by depending entirely upon diffusion. Diffused light is apparently not as efficient as the brilliant light you get from an unshaded arc. It takes, undoubtedly, a great deal more of energy to give an equal amount of light in candle power, at the same time it is a question whether lights supplied in that way consume the same amount of energy as a single arc light would to give the same illumination in the room. I think it is safe to say that the diffused light will give a much better illumination in spite of its lessened gross amount, on account of the fact that the light comes from the direction which is most useful, and is faintly tinged to a pleasant color by the slight tinging of the ceiling, and that brings me to the rather important matter of color.

Color is a matter of great importance to illumination, for two reasons and in two particular ways. In the first place, the color of the light which we are wont to receive is not white; it averages a rather yellowish white. We sometimes think it necessary to obtain extreme whiteness of illumination. You received it from that lamp a moment ago—it did not look white, but unpleasantly dazzling. An illumination of normal color, that is to say, a somewhat yellowish white, is the one to which we are all used, and by which we are wonted to judge the colors of objects above us. Deep colors are always unpleasant and entirely unsuited to any practical illumination: even a very much modified shade is not altogether pleasant. It is a sort of bluish, moonlight color. In general, it is safe to say you cannot fool with the color of your illuminant without producing disagreeable results: it makes no difference what the exact shades are. It is very desirable to confine oneself in the use of colors in illuminants, to colors to which one has become habituated—that is white or yellowish white.

Practically all our sources of light at the present are incandescent solids, of one sort or another. The flame is merely the aggregation of white hot, yellow hot or red hot particles of carbon. The incandescent filament from one of these lamps is merely a filament of carbon heated red hot, or white hot, as the case may be by the current. In the case of the arc lamp we have the same thing, the radiant point there being the crater of the arc at the ends of the carbon, which are heated to a very high temperature, indeed, and are brilliantly radiant. It should be borne in mind that the temperature of the flame, or the temperature of the radiant matter, is the thing which largely determines its color. A piece of iron heated moderately is red hot. After a bit it gets nearly white hot, and yellow hot, and finally it comes to a dazzling brightness, or whiteness. The same is true of any incandescent solid. We find certain oil lamps give a distinctly orange tinge; we find candles giving a pronounced yellowish tinge, with much red, and the gas lamps give a yellowish hue, with less red, finally the incandescent lamps when they are thoroughly energized by the current and heated extremely hot give a light which is almost pure white, as white as the arc, and the

arc lamp, which has a higher temperature than all the others gives a light which is distinctly white or bluish white. It should be borne in mind that in incandescent lamps the question of color has nothing to do with the amount of light: simply the temperature of the filament which gives the light.

For the purpose of obviating the extreme brilliancy which we get from the unshielded light the best general expedient is the frosted globe. There are many others which can be used successfully. There are various ways of lessening the extreme brilliancy of incandescent lamps, besides the use of the frosted globe. For example, we have lamps which can be toned down very materially by the use of shades, which produce in no very striking way the same softening of the light which you get from the use of the frosted bulb.

The incandescent lamp, in spite of its usefulness in a general way, from a scientific point of view is unsatisfactory. You cannot get a high enough temperature in the filament, which will stand up any length of time, and get the efficiency you want to get. Of the total energy which goes into a lamp like that before you (and it is a pretty efficient lamp, happens to be a 2-watt lamp), only about 5 to 6 per cent. is returned to you as light. The rest of it goes into heat. The amount of heat radiated, in spite of the fact that the incandescent lamp is, of all the ordinary illuminants the one that gives the least heat, amounts to 94 per cent., or thereabouts, of the total energy supplied to the lamp. The low efficiency is due purely to the fact that we cannot carry the filament at a temperature high enough to get the desired increase in efficiency. For the purpose of improving the efficiency, there have been conducted experiments innumerable, but the best product of to-day are lamps running at 3 watts per candle, or a little under, but they still have an efficiency of only between 5 and 6 per cent. For better results than that we have to turn to other sources of illumination and the obvious thing to do is to carry up the temperature of the illuminant to a point far beyond that which is found in the incandescent lamp. That is done in the arc lamp. At the temperature of the arc the carbon is vaporized very rapidly. Carbon, such as you find in the arc lamps, and in the filaments of incandescent lamps, is a substance somewhat volatile. It volatilizes somewhat like iodine, passing from solid into the form of vapor and softens and gets putty-like, so when the incandescent lamps are carried to a high temperature the filament softens and rapidly breaks. As a result we have to look to the arc for help.

There is a difference, even in arcs, in point of brilliancy, and there again, just as in the incandescent lamp, it resolves itself into a question of temperature. The bigger the arc is, the larger the volume of current and the hotter the arc gets, the more efficient it becomes. Some of the earlier lamps, which carried a heavy current and gave a very short arc, were tremendously brilliant and very efficient. Here is a lamp, with a short, flat arc, taking a heavy current and is enormously efficient. It has perhaps 35 per cent. more efficiency in producing light than these small arcs, because the carbon is carried at a much higher temperature. It is, however, an arc which is not now a favorite by reason of its unsteadiness and hissing and sputtering. We have passed now almost entirely to the enclosed arcs. The enclosed arc is simply an arc with an air-tight

globe around the carbon, the air-tight globe having a sleeve at the top into which the carbon fits nicely, so that the air has the oxygen burned out of it, the carbon burns in an atmosphere which does not oxidize as rapidly, and consequently gives a better light. The enclosed arcs generally have around them a second globe. In this case the arc has around it a very large sample of these holophane globes, which gives an admirable distribution of light, and softens it in a way highly satisfactory, without at the same time cutting off any considerable amount of the light.

The alternating arc is another example of the way in which the temperature of the heated body affects its efficiency. You have there the first type of alternating arc brought out—the Jablochkoff candle—which was used years ago for illumination in Paris. I fancy it is the first time one has been seen in this city for many years as they have passed out of use. The light there is curious in color, because between the two carbon elements conveying the current there is a thin strip of kaolin which becomes very hot, and the kaolin gives out, like the lime light, a considerable amount of light on its own hook. In fact, the principle of the Jablochkoff candle, with its bridge of kaolin between the light and the carbon, is quite similar to the principle of the Nernst lamp which has recently been brought out. In that case there is conduction across a stick of substance, which is normally a non-conductor. In this case there is a kaolin strip which passes between the two carbons. The lamp had, from the earliest times, the same unpleasant habit, you have seen illustrated, of going out on small provocation; and as the lamps are practically put out they had several carbons with a very ingenious way of shifting the current from one to the other, in case one came to grief.

After all, you will say that the efficiency of even our best illuminants is not very high. The efficiency is not anything like what we would have it. It is not a very comforting thing to think of putting in 100 horse power of energy, and getting out 5 horse power in this form, the form in which you want to use it. It is not consoling to think of utilizing any arc lamp, and getting out, if you have good luck and use a first-rate lamp, 10 per cent. of the energy you put in.

There is a determined effort going on to better the efficiency of the incandescent lamp, but the result is not by any means certain. It is certain, however, that a lamp has been produced which does give an efficiency as high, or higher, than can be obtained by any incandescent lamp, and approximating that which can be obtained by the smaller light of the electric arc, and that is one very encouraging direction for experiment. I imagine that in six months or a year the Nernst lamp will become perhaps not a common sight, but a lamp which will be found more readily than I could find one at this time for the purposes of this lecture. An interesting line of operation is that which depends on the dropping of incandescent solids and passing to incandescent gas. The phenomenon on which experiments of this kind are based is that of the passage of electricity through rarefied gas, such as is seen in the ordinary Geissler tubes, as exhibited. I had hoped up to the last minute I should have a Geissler tube lamp here, but, like the Nernst lamp, it is not quite ready to materialize. There is every reason to believe it is possible to extract from incandescent gas

perhaps as high as 25 or 30 per cent. energy put in it in the form of light. Nevertheless, the difficulties in the way are many. We have available very good incandescent lamps, very good arc lamps, and we have an enthusiastic hope of getting something along the line of the Nernst filament, which may be useful. We have an earnest wish that we may perhaps discover in the use of incandescent gas a higher efficiency than we can get from solid incandescence, and we have an illusory sort of an idea, if fortune favors, we may discover the secret of the glow-worm, but of that the glow-worm himself will have to speak. Science does not know his mind in that regard. So we can say, in summing up the progress, at present we have a very useful means of illumination, but we have not, by any means, yet reached the point where we can look pleasantly on our artificial illumination and say we have anywhere nearly what we want.

How to Get on in the World.

To shirk a disagreeable task that has to be done, with good will or without; to try to evade the inevitable and postpone necessity: to stand shivering on the brink when the plunge must perforce be made, and the sooner it is made the sooner the shock and its consequences will be over; to waste our strength in fretful anticipations of fatigue, and to substitute dilettanteism for honest work, perfunctoriness for brave endeavor—these ways of living, though too much after the manner of half-hearted men, are the ways which lead to ruin and destruction. It would seem, indeed, as if the chief good of life consists in the steadfastness with which one can buckle to and bear one's burden—buckle to and bear one's load: as if tightening the straps and strengthening the harness itself lessens the strain, and the more closely one stands up to one's work the easier it is to do. Putting off the day of buckling to, hoping for miracles to be wrought in our favor by which that day shall never come at all, praying to the friendly Hercules looking down at us from the clouds to lift our cart from the rut and save our own shoulders from the wheel, are mispent hours and misdirected energies in every way. It would be more to the purpose to buckle to with a will, and lift that sticking cart by one's own efforts. It can be done, and more—it has to be done; and delay scores nothing to our advantage, but much to our disaster, for sticking carts have the faculty of sinking deeper the longer they stand, and difficulties accumulate by time and delay, till what was once a layer of fine white sand, and which a feather could brush away, becomes by neglect and lapse of moments a hard and concrete stratum, which not even the unassisted efforts of Hercules himself could break up or remove. Take the case of a man whose affairs are going wrong, and whose books show a perilous inclination. Obviously the only rational thing for him to do is to buckle to at once, go into his affairs, check his expenditure, cut off his superfluities, and lift his cart from the rut of bankruptcy into which it is fast sinking. But if he has not the energy or common sense necessary for this—if he delays for this hope, for that fear—if now this problematical gain is to be made, that bad debt paid up—if his wife's delicate nerves need management, and the state of her health demand a carriage—if he must strain one point for his son on his en-

tering into life, and another for his daughter on her first season—if shadowy fingers slacken the straps, and the mildew of fallacious hope rusts the buckles—what can there be but irremediable disaster and a general collapse as the result of those insane attempts to shirk a painful task and evade the inevitable? If he had had the courage of his situation, and buckled to at the first, he might have retrieved all that had been lost, and made good his future position. It was simply a question of promptness and daring—of buckling to with a will. But he temporized and delayed, slackened this girth, loosened that strap, let ends fly loose and buckles slip, hoping rather than doing, and looking to that stalwart Hercules in the clouds or on that machine where he thought was hidden the god who would put all things right with a nod of his head, rather than trust to himself, putting his own shoulder to the wheel and buckling to like a Trojan. In consequence when he comes to grief, anyone but himself could see he was foredoomed, and upsets the whole concern into the ditch. This is one result of that foolish temper which will not accept cheerfully what it cannot avoid by any ingenuity in the world, and which does not reflect that the more closely-fitting the harness the easier it is to draw the load. If grumbling at a trouble would lessen and finally disperse it altogether, by all means let it be done; if shifting one's yoke from shoulder to shoulder, and vainly trying to pull it over one's poor long ears, would slacken the strain and finally dissolve the substance, one would be well quit of one's impediment for a little abrasion of the epidermis; but when it only chafes and does not slacken, only deepens the sore, and never dissolves the substance, it seems but a poor exercise of energy and ingenuity, and buckling to would be a better employment for all.—“Calvert's Mechanics' Almanack.”

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended January 30:

Antwerp, 47 packages, \$2,197; Argentine Republic, 101 packages, \$3,958; Australia, 1 case, \$22; Barcelona, 1 package, \$14; Bilbao, 2 cases, \$292; Brazil, 37 packages, \$2,812; British Guiana, 23 cases, \$467; British East Indies, 4 packages, \$188; British Possessions in Africa, 163 packages, \$9,032; British West Indies, 9 packages, \$215; Central America, 41 cases, \$2,120; China, 30 packages, \$870; Chili, 6 packages, \$218; Cuba, 111 cases, \$7,090; Ecuador, 12 cases, \$170; Genoa, 57 boxes electrical railroad material, \$1,815; 168 packages, \$43,076; Glasgow, 9 cases, \$420; 383 packages, \$47,102; Hamburg, 15 packages, \$3,884; Havre, 7 cases, \$198; 11 packages, \$1,201; Hayti, 2 cases, \$22; Hull, 29 packages, \$3,893; Grenoble, 1 case, \$130; Hong Kong, 30 cases, \$2,614; Japan, 152 packages, \$31,749; Leicester, 1 case, \$75; Liverpool, 217 packages, \$4,923; London, 513 packages, \$23,931; Manchester, 76 packages, \$18,400; Marseilles, 49 cases, \$744; Mexico, 112 packages, \$6,827; Milan, 27 cases, \$1,135; Naples, 10 cases, \$2,381; Newcastle, 4 cases, \$200; Nice, 4 cases, \$520; Peru, 60 cases, \$2,226; Sheffield, 3 packages, \$107; Siam, 2 cases, \$143; Southampton, 17 packages, \$289; St. Petersburg, 4 packages, \$510; U. S. Colombia, 9 cases, \$2,272; 23 packages, \$940; Uruguay, 3 packages, \$150; Venezuela, 28 packages, \$148.

PERSONAL MENTION.

Mr. J. M. McGrew, manager of the Kaster Electric Manufacturing Company of Chicago, died at his home last week. Death was due to Bright's disease.

Hon. Allan L. McDermott of Jersey City was recently elected president of the Washington Traction & Electric Company, which comprises eleven of the twelve street car lines and both the electric lighting companies of Washington, D. C.

Mr. S. D. Sprong has been appointed chief electrical engineer of the Central Electric Company, with headquarters at Metuchen, N. J.

Mr. E. H. Barnes of New Haven, Conn., has been elected a director of the Boston Electric Light Company and **Mr. Sidney Hosmer** was appointed general manager.

Mr. E. T. Holmes was lately elected president of the Holmes Electric Protective Company of this city, to succeed his father, the late Edwin Holmes.

INCORPORATIONS.

The Advance Electric Company, Indianapolis, Ind. Capital stock, \$5,000.

The Louisville Anchorage & Pewee Valley Electric Railway Company, Louisville, Ky. Capital stock, \$750,000.

The Auto-Dynamo Car Company, New York City—to manufacture electrical machinery. Capital stock, \$200,000.

The Leadville Electric Power Company, Denver, Col. Capital stock, \$3,000,000. Directors: E. S. Douglas, L. R. Tatum and George C. Manly.

The Indianapolis Electric Plating Company, Indianapolis, Ind. Capital stock, \$2,000. Directors: Benjamin Aufderheide, Fritz Boller and others.

The Elkhart Electric Company, Indianapolis, Ind. Capital stock, \$100,000. Incorporators: Martin V. Berger, Charles H. Tenney, J. S. Dodge, Charles Hewitt and James Dushane.

The Electrical Engineering & Developing Company, New York City. Capital stock, \$10,000. Directors: H. S. Cooper, Ithaca; W. S. Gurnsey, El, New York City, and B. Y. Frost, Nyack.

The Evansville Electric Railway Company, Evansville, Ind. Capital stock, \$50,000. Directors: J. E. Bowles, C. A. W. Dodge, J. C. Parker, Sebastian Henrich and Alexander Gilchrist.

The Electro-Chemical Extraction Company, Berwick, Me.—to do a mining business. Capital stock, \$300,000. Officers: President, Edward F. Gowell of Berwick; treasurer, Harold V. Noyes of Berwick.

The Curtiss Construction Company, Cleveland, O.—to make a specialty of equipping electric and steam railways. Capital stock, \$10,000. Incorporators: E. J. Kennedy, James R. Curtiss, J. C. Gallup, Jay E. Latimer and Aaron Black.

A Good Book on Copper.

We are in receipt of "The Copper Handbook," by Horace J. Stevens of Houghton, Mich. This work, which contains some 350 pages of matter, deals with the copper industry throughout Michigan and will be found invaluable to copper investors. In the opening pages the early history of the discovery of copper in the Lake Superior districts is touched upon, after which such invaluable information as the detailed descriptions of all Lake Superior copper mines appears. This work might aptly be termed the "Copper Investor's Guide," as without exception it furnishes in a convenient and condensed form the most valuable information for copper investors that has yet come under our notice. The price of this work is \$1 bound in paper or \$1.50 in cloth. It is the author's intention to keep the book thoroughly up-to-date by issuing a revised edition every year.

Death of Mrs. Ralph W. Pope.

Mrs. Ruth Emma Whiting Pope, wife of Ralph W. Pope, secretary of the American Institute of Electrical Engineers, died January 26 at her home, 570 Cherry street, Elizabeth, N. J., after an illness of nearly two months.

COMMERCIAL PARAGRAPH.

A pamphlet is just issued by J. S. Bache & Co., 66 Exchange Place, New York, entitled "American Industrials, with Special Reference to the Preferred Shares as Investments." It contains descriptions of the organization, financial condition and other salient facts of thirty industrial securities. The object is to show that there are a number of industrial stocks which may be considered safe from the purely investment basis. Not the least important feature of the publication is the digest of New Jersey laws, where the protection afforded to preferred shareholders under the general laws of the State of New Jersey are pointed out and the special conditions which differ therefrom in the case of individual companies. The specific information considered includes the organization, payment of dividends since consolidation, officers and directors, financial statement, balance sheet, president's report, bond investment account, constituent companies, annual output of the subsidiary companies before consolidation and since, character of product, range of stock quotations, underwriters' profits, preferred stock powers, charter requirements, character of control and investment advantages of the preferred shares.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JANUARY 29, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

- 666,660. Lubricating Trolley-Wheel. Alfred W. Gabrio, Hazleton, Pa., assignor of one-half to Josiah T. Berryman, same place. Filed June 12, 1900.
- 666,736. Fender for Street Cars. Luther Case and Henry J. Schultdt, St. Paul, Minn., assignors to Phillip W. Herzog, same place. Filed Feb. 26, 1900.
- 666,900. Automotor-Trolley for Electric Currents. Louis Lombard-Gerin, Lyons, France. Filed Nov. 10, 1900.
- 666,964. Car-Fender. Franklin P. Laws, St. Louis, Mo., assignor of one-half to Frank H. Houghton, same place. Filed Oct. 15, 1900.
- 667,079. Traveling Contact for Underground Electric Railways. John Floyd, Washington, D. C. Filed April 27, 1900.
- 667,110. Electric Railway. Granville T. Woods, New York City assignor to the General Electric Company of New York. Filed Sept. 29, 1897. Renewed Oct. 15, 1898.
- 667,133. Pneumatically-Controlled Trolley. John B. Linn, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Nov. 13, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

- 667,106-667,107. Electric-Arc Lamp. Elihu Thomson, Swampscott, and Charles E. Harthan, Lynn, Mass., assignors to the General Electric Company of New York. Filed Oct. 19, 1897, Nov. 4, 1897.
- 667,119-667,120 667,121-667,122. Electric-Arc Lamp. Richard Fleming, Lynn, Mass., assignor to the General Electric Company of New York. Filed Aug. 29, 1898, Nov. 9, 1898, March 2, 1899, Nov. 12, 1900.
- 667,123-667,129. Electric-Arc Lamp. Charles E. Harthan, Lynn, Mass., assignor to the General Electric Company of New York. Filed July 27, 1898, Oct. 2, 1899.

ELECTRICAL MACHINERY AND APPARATUS.

- 666,655. Electric-Motor Controller-Frame and Method of Constructing Same. Thomas W. Eaton, Chicago, Ill., assignor to the Eaton & Prince Company, same place. Filed Oct. 8, 1900.
- 666,656. Mounting for Electric Motors. Thomas W. Eaton, Chicago, Ill., assignor to the Eaton & Prince Company, same place. Filed Oct. 8, 1900.
- 666,691. Electric Motor. Oscar H. Pieper and Alphonse F. Pieper, Rochester, N. Y. Filed Feb. 2, 1900. Renewed Dec. 18, 1900.
- 666,764. Electric-Circuit Controller. Nils O. Lindstrom and Allan Cowperthwait, New York City, assignors to Alonzo B. See and Walter L. Tyler, same place. Filed July 6, 1900.
- 666,831. Device for Indicating Disarrangement of Armatures of Electric Motors or Generators. Joseph T. Watson, Philadelphia, Pa., assignor of one fourth to Jacob E. Fritz, Camden, N. J. Filed Aug. 16, 1900.
- 666,849. Dynamo-Electric Machine. Arthur E. Jenney, Boston, Mass., assignor to the Holtzer-Cabot Electric Company, Brookline, Mass. Filed May 5, 1899.
- 666,920. Automatic Cut-Out Device for Use in Connection With Electrical Generators. Monroe S. Clawson, Weehawken, N. J. Filed May 21, 1900.
- 666,940. Static Electric Machine. Jens Sorensen, Grand Rapids, Mich. Filed Jan 19, 1900.
- 667,054. Prepayment-Meter. Edmund Allo, Lynn, Mass., assignor to the General Electric Company of New York. Filed April 20, 1898.
- 667,066-667,070. Prepayment Electric Meter. Frank P. Cox, Lynn, Mass., assignor to the General Electric Company of New York. Filed Sept. 13, 1897, Oct. 12, 1899.

- 667,067-667,069. Prepayment-Meter. Frank P. Cox, Lynn, Mass., assignor to the General Electric Company of New York. Filed April 14, 1898, Oct. 12, 1899.
- 667,068. Prepayment Mechanism. Frank P. Cox, Lynn, Mass., assignor to the General Electric Company of New York. Filed Oct. 8, 1898.
- 667,030. Coin-Controlled Mechanism. Charles E. Holmes, Lynn, Mass., assignor to the General Electric Company of New York. Filed Jan. 18, 1900.
- 667,095. Electrical Traction on Closed-Conduit Systems. Howard Lane, Birmingham, Eng. Filed Aug. 18, 1900.
- 667,103. Insulator. Howard R. Sargent, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Aug. 31, 1900.
- 667,113. Safety Device for Dynamo-Electric Machines. Harold W. Buck, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 11, 1899.
- 667,114. Means for Preventing Hunting of Dynamo-Electric Machines. Harold W. Buck, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed April 28, 1900.
- 667,135. Rheostat. George F. Martin, Corydon, Ind. Filed June 5, 1900.
- 667,138-667,139. Prepayment-Meter. Eustace Oxley, Lynn, Mass., assignor to the General Electric Company of New York. Filed Oct. 28, 1899, March 14, 1900. Renewed Oct. 18, 1900.
- 667,144. Static Electric Machine. Charles H. Cook, Indianapolis, Ind., assignor to the Electro-Therapeutic Manufacturing Company, same place. Filed Jan. 2, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

- 666,674. Telephone-Directory Holder. Irving S. Hoffmann, Mansfield, O. Filed Sept. 26, 1900.
- 666,675. Telephone. George L. Hogan, New York City, assignor of one-half to Julian S. Carr, Durham, N. C. Filed March 9, 1900.
- 666,698. Telephone Exchange Circuit and Signaling Apparatus. Malcolm C. Rorty, Dedham, Mass., assignor to the American Bell Telephone Company, Boston, Mass. Filed Oct. 4, 1900.
- 666,706. Selective Signaling and Registering Apparatus Circuit. Herbert E. Shreeve, Dedham, Mass., assignor to the American Bell Telephone Company, Boston, Mass. Filed Sept. 18, 1900.
- 666,874. Arrangement of Switching Appliances in Connection With Telephones. Parnell Rabblidge, Sydney, New South Wales. Filed Feb. 26, 1900.
- 666,883. Communicating System. Isidor Kitsee, Philadelphia, Pa., assignor to Charles E. Wilson, same place. Filed Feb. 20, 1896.
- 667,016. Automatic Corrector for Step-by-Step Mechanism. Charles O. Janney, St. Louis, Mo., assignor of one-half to Adolf Wissler, same place. Filed Dec 26, 1899.

MISCELLANEOUS.

- 666,658. Electropneumatic Organ-Action. William B. Fleming, Detroit, Mich. Filed Jan. 15, 1900.
- 666,677. Microphone. Alfred G. Holcombe, Southampton, Mass., administrator of Alfred Goodrich Holcombe, deceased. Filed May 16, 1900.
- 666,699. Electric Elevator. Harold Rowntree, Chicago, Ill. Filed Feb. 17, 1900.
- 666,729. Electric Warp-Stop and Filling-Changing Mechanism for Looms. Horace Wyman, Worcester, Mass., assignor to the Crompton & Knowles Looms Work, same place. Filed March 5, 1900.
- 666,731. Electromedical Eyeglasses. Philbert Balme, Izieux, France. Filed March 26, 1900.
- 666,737. Burglar Alarm System. Clyde Coleman, Chicago, Ill., assignor, by mesne assignments, to George B. French, Boston, Mass., and Frank L. Hall, New York City. Filed May 6, 1899.
- 666,744. Terminal for Electric Conductors. Alvirus L. Ellis, Chicago, Ill. Filed Feb. 12, 1900.
- 666,861. Printing Telegraph Instrument. Louis M. Casella, London, Eng. Filed Oct. 30, 1899.
- 666,912. Ship's Telegraph. Leon S. Thompson, Washington, D. C. Filed May 25, 1899.
- 666,933. Electric Belt. John Moore and James Murray, Providence, R. I., assignors to the Champion Electric Belt Company, same place. Filed June 30, 1900.
- 666,954. Relay. Sidney G. Brown, Bournemouth, Eng. Filed March 15, 1899.
- 666,956. Electric Connecting-Handle for Automobiles. Edward N. Dickerson, Stovall, N. C. Filed Nov. 5, 1900.
- 666,958. Selective Signaling. Frank C. Ewing, Acadia, Va. Filed Feb. 8, 1900.
- 667,028. Electric Meter. Alexander D. Lunt, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Oct. 31, 1900.
- 667,115. Burglar Alarm System. Clyde Coleman, Chicago, Ill., assignor to the Bankers' Electric Protective Company, same place. Filed July 12, 1898.
- 667,123. Electric Protective System. Henry F. Freed, Harrisburg, Pa. Filed Aug. 31, 1900.
- 667,125. Electrical Connector. Henry F. Freed, Harrisburg, Pa. Filed Sept. 27, 1900.

THE TELEPHONE WORLD.

Bell Company Instruments.

The American Telephone Company (Bell) makes the following return of instruments placed during the month ended January 20, the first month of the company's current fiscal year:

	1901	1900	Increase.
Gross output.....	66,048	58,853	7,195
Returned.....	25,766	18,966	6,800
Net output.....	40,282	39,887	395
Total outstanding.....	1,993,098	1,620,392	372,706

Fifteen months ago the Syracuse, N. Y., Telephone Company, which had come into possession of the Eugene Hughes subway franchise, began the construction of its subway through the streets of that city. Between that time and this the work of construction of the Syracuse Telephone Company has gone steadily on, involving an expenditure of nearly \$400,000 for the erection of a system, now one of the most elaborate and complete in operation in any American city, and patterned after some of the most perfect systems in the world, those operated by the Government in several of the great European countries. The complete equipment of the exchange, including the apparatus of the wire chief, the toll board, etc., was made at a cost of \$75,000. The type of telephone used by the Syracuse Telephone Company is that of the L. M. Ericsson telephone of Stockholm. The out-of-town service of the company has been extended as far east as Herkimer, a line to Cortland has been begun and will probably be finished by March 1, and connection with Auburn and Oswego is expected in the immediate future. In fact, the management of the new company say it is only a question of time when a complete long distance service will be offered to subscribers.

M. Adrian King, a promoter of independent telephone systems, filed an application with the Los Angeles, Cal., city council a short time ago, in which he asks for a franchise to construct and operate a telephone plant in Los Angeles. Mr. King, who was formerly with the Kinlock Telephone Company of St. Louis, claims that he is seeking a franchise in behalf of himself and a number of Los Angeles men, whose names he would not divulge. He thinks there is a good opportunity for a competing system in that city, especially at the present time. According to Mr. King, his company which is not yet incorporated, proposes to furnish Los Angeles with an improved telephone service at rates much lower than those charged by the Sunset Company. If the new concern gets a franchise and operates a system, it claims that there will be no party lines nor slot machines, but all 'phones will be unlimited. There will be three rates: For business 'phones, \$60 per year; for professional men, \$50 per year, and for residences, \$36 per year.

The Diamond State Telephone Company, with main offices at Dover, Del., and of which H. A. Richardson of that city is president, has purchased of Isaac Robinson, Turner & Son, and F. H. Harper & Son, of Kent County, Md., the telephone line owned and operated by these firms between Hebron station, on the Baltimore & Delaware Bay Railroad, Still Pond and Betterton. This line was built in 1899. The Diamond State Company bought with the assurance that the long distance service will be given to Betterton and Still Pond giving them direct communication with Baltimore, Philadelphia, Wilmington and Washington.

Stephen Engle, of Hazleton, Pa., has invented a telephone transmitter which, it is claimed that experts say, will greatly lessen the cost of equipment of telephone plants. Mr. Engle says that he can make a transmitter that will be no larger than a thimble, and that when manufactured at wholesale they will cost hardly a cent each. The tests which have been made with the new transmitter show that with it only half the number of batteries used now will be needed, while the sound is much more distinct. Over a circuit of 54 miles the tick of a watch was heard as clearly as if it were within a foot of the ear.

The telephone franchise was recently sold at a public auction in Louisville, Ky., by order of the general council. E. M. Coleman was the only bidder. He paid \$10,000 for the franchise, and says he will start an independent company.

The announcement was recently made in Willmar, Minn., that D. N. Tallman, acting for the Minnesota Electric Telephone Company, has purchased the lines and business of the Northern Minnesota Telephone Company.

The Pierce County Telephone Company has made arrangements to put in a local exchange at Spring Valley, Wis., connecting St. Paul and the whole Northwest.

A local telephone line, about six miles long, is being built by settlers in Richmond and Waldron, Ore.

Memphis Company About to Begin Work.

The charter of the Memphis, Tenn., Telephone Company, fixing the capital stock of the company at \$200,000, has been filed in the registrar's office. The incorporators are: William P. Curtis, S. P. Walmsey, William P. Richardson, C. B. Galloway, Jephtha M. Fowkes, Bolton Smith, Thomas R. Reddick, Leon Hunt, James S. Warren and William A. Percy.

The franchise to construct and operate lines in the city was obtained by the company about two years ago, and the charter was offered for registration on August 7, 1899, but the matter was not carried forward at that time, because of the pending action of the city council with reference to an underground conduit system for electrical companies.

J. S. Warren recently said that the company would be organized, and work would be begun at once. "The lines," said he, "will be extended beyond the county, as there are numerous independent companies ready to meet the Memphis Company half way."

William P. Curtis is favorably spoken of for president of the company. The organization of the company will offer competition to the Cumberland Telegraph & Telephone Company of Nashville, which at present controls the entire Memphis 'phone system.

Stockholders of the New York & New Jersey Telephone Company have been notified that an important meeting will be held at the offices of the company, 81 Willoughby street, Brooklyn, on Friday, March 1. The meeting is for the purpose of voting upon a proposition to increase the capital stock of the company from the present amount, \$8,000,000, to \$15,000,000. This will consist of 80,000 shares of the par value of \$100 each, to \$15,000,000, to consist of 150,000 shares of the par value of \$100 each. It is said that the continued increase in the business of the company indicates that expenditures of a considerable amount will be required for the enlargement of the plant during several years to come. Should the increase of capital which the directors have recommended be voted by the stockholders at the meeting on March 1, it is the purpose of the directors to offer the new stock to the present shareholders from time to time in such amounts as may be needed in the construction requirements of the company.

According to a Utica, N. Y., paper, the West Canada Telephone Company has sold its interests to the Remsen & West Canada Creek Telephone Company, and hereafter the telephone service of the district covered by these two companies will be in the hands of the latter named organization. The West Canada Telephone Company was organized October 17, 1900. At that time the engineers engaged on the Trenton Falls construction conceived the idea that a telephone line in that part of the State would be a paying investment and a company was organized, its stockholders being for the most part members of the engineering party. The consideration is not known, but it is stated that it was satisfactory to all parties in the action.

At the recent quarterly meeting of the Tidewater, Va., Telephone Company at Gloucester Courthouse, Mr. Eugene Rhodes was elected manager of the exchange at Saluda, and the lines of Middlesex and Essex Counties. It was decided to rebuild the old Mathews line and open an exchange at Mathews Courthouse, Va., provided \$2,000 worth of stock should be sold at par. It was also decided to build a metallic trunk line from Gloucester Courthouse to Richmond as soon as \$8,000 worth of stock was taken up. The board secured the continued services of Mr. L. C. Catlett as superintendent of this system for the coming year.

Indorsed proposals for an underground telephone cable system will be received at the bureau of yards and docks, Navy Department, Washington, until 1 o'clock, February 16, and then and there publicly opened, for furnishing and installing an underground telephone cable system at the Navy Yard, Washington, D. C. For plans, specifications and forms of proposal address Mordecai T. Endicott, chief of bureau.

The Kenton, O., Telephone Company, which now has over 300 subscribers, held its annual meeting a short time ago. James L. Moore was elected president, J. B. Seymour vice-president and Harlan Park secretary and treasurer. The company proposes to build a number of lines throughout the county, connecting the houses of farmers.

The Harlan County Telephone Company, with a capital stock of \$2,000, is empowered to construct and operate telephone companies in the various counties of the State of Kentucky.

The Mutual Long-Distance Telephone Company has lately finished its new line between Staunton and Harrisonburg, Va.

Free Telephone Service for Huntington, W. Va.

Huntington is one of three cities in the United States where telephone service is had by the public absolutely free of charge. In that town the Bell and a home company are fighting each other tooth and nail, and three years ago the Bell Company created a sensation by announcing that, until further notice, its service would be given all subscribers free.

This was expected to crush the home company, but, contrary to expectations, it has thrived; its rates have not been cut, and its number of telephones has increased. Of course, there has been an active demand for the free Bell telephones, but the home company is owned largely by local residents.

Seattle, Wash., is at present witnessing a lively contest between two sets of capitalists for the privilege of constructing a telephone system in opposition to that now conducted by the Sunset Telephone & Telegraph Company. As the matter now stands two rival companies hold possession of franchises recently granted by the city council, and each declares that it possesses the only valid authority to construct and maintain its system in that city. The last franchise granted was issued to a company of capitalists represented by J. S. McGroarty. Twelve months ago the council issued to the Seattle Automatic Telephone Company a franchise which required that 300 'phones should be installed and in operation within six months. Subsequently the company applied for and obtained an extension of time in which to install the system, and its rival now contends that the extension is invalid. Both concerns aver that they are preparing to install plants costing not less than \$300,000 each and a franchise war, which will require the intervention of the courts to settle is in prospect.

At the annual meeting of the stockholders of the Erie Telegraph & Telephone Company, January 31, in this city, the by-laws were amended changing the date for annual meetings to the Thursday preceding February 1 in each year. It was voted to reduce the board of directors from twenty-five to fifteen. The new board of fifteen was then elected as follows: Edward Abbott, Walter Abbott, A. B. Chandler, Frank A. Cutting, Philip Dexter, William Eddcott, Jr., Frederick A. Farrar, Reginald Foster, Charles J. Glidden, Francis R. Hart, William J. Latta, Frank M. Riter, James J. Storrow, Charles S. Tuckerman and Henry R. Wilson.

The local telephone line owned by Charles Seymour of Knoxville, Tenn., is being re-constructed and complete metallic circuits are being put in instead of single wires. A central office will be located at Benton, Tenn., and a small toll will be charged instead of free use as at present. The line will connect Parksville, Fetzerton, Benton, Wetmore, Coghill and Reliance, all with Madisonville, Tenn.

At a meeting of the directors of the Southern Bell Telephone & Telegraph Company, held in this city last week, W. T. Gentry, of Atlanta, Ga., was appointed general manager of the company, with headquarters at Atlanta. Mr. Gentry succeeded Charles H. Wilson, who resigns to accept the position of general superintendent of the American Telephone & Telegraph Company, with headquarters in this city.

Probably the most complete private telephone system owned and operated by a railroad company is that of the New York, New Haven & Hartford Railroad, by means of which it is possible to transmit orders and communications to the most remote points on the company's lines.

Arrangements are being made to put in another telephone exchange at San Saba, Tex.

It is reported that Hoquiam, Wash., will soon have a night telephone service.

TELEPHONE INCORPORATIONS.

The Ashley Telephone Company, Ashley, O. Capital stock, \$50,000.

The Winona Central Telephone Company, Winona, O. Capital stock, \$10,000.

The A. C. Himebaugh Telephone Company, Burr Oak, Mich. Capital stock, \$5,000.

The Tom A. Marshall Telephone Company, Keithsburg, Ill. Capital stock, \$50,000. Incorporators: Tom A. Marshall, Frederick P. Burgett and David Adelsdorf.

The Zanesville Citizens' Telephone Company, Zanesville, O. Capital stock, \$200,000. Incorporators: Moses M. Granger, Rufus C. Burton, Edward S. Grant, William C. Handley, H. A. Sharp, William D. Schultz and Sherman M. Granger.

GENERAL ELECTRICAL NEWS.

Lighting.

Alden, Ia.—The plan to put in an electric lighting and heating plant here is meeting with favor among the people and arrangements will soon be made to install an electric lighting system.

Canfield, O.—A company has been organized here to erect and operate an electric light plant.

Cleveland, O.—School Director Bell says that electricity is much cheaper than gas, and that electric lights will be placed in all school buildings where artificial light is necessary.

Crayon, O.—F. Long contemplates the erection of an electric light plant here.

Danforth, Me.—There is a rumor that electric lights are to be put in the village next spring.

Dartmouth, N. S.—This town will ask authority from the Provincial Legislature to borrow \$40,000 for the purchase of an electric light plant.

Dresden, Tenn.—A committee has been appointed to investigate the cost of putting in an electric light plant.

East Point, Ga.—This place is figuring on electric lights.

Elberton, Ga.—The citizens of this place are talking of erecting an electric light plant.

Emporia, Va.—A. L. Satterwhite, of this place, invites bids for an electric lighting and heating plant, 140 volt alternating current dynamo, about 500 lights.

Fryeburg, Me.—The proprietors of the chair factory have decided to establish a system of electric lights and it will be generally used throughout the village.

Hartford, Conn.—Senator Brothwell has introduced a resolution instructing the comptroller to procure estimates of the cost of installing an electric lighting plant in the Capitol building, and also an estimate from some electric lighting company or companies of the cost of furnishing electric light for the building.

Jackson, Tenn.—This city will install an electric lighting plant in connection with its waterworks. Plans are being prepared and bids will be received until March 1. Address S. C. Lancaster, city civil engineer.

Lake Providence, La.—Bids will be wanted until February 22 for the erection of an electric light plant.

Mackinac Island, Mich.—The Mackinac Park Commission has given to H. C. Noble, F. C. Andrews and H. Warren, of Detroit, the franchise for the electric lighting and waterworks privilege on Mackinac Island. The cost of the entire improvement will be \$100,000, and work will begin this month.

Newark, N. J.—A contract for the entire illumination of the Pension Building in Washington on the occasion of the inaugural ball was recently awarded to the Electric Motor & Equipment Company of this city.

Newbern, Tenn.—The Newbern Water & Electric Light Plant was lately destroyed by fire. The loss is estimated at \$10,000. A bill is now before the Legislature to authorize the town to issue more bonds to further increase the facilities of the plant.

Norwich, N. Y.—The Norwich Electric Company with a capital of \$100,000, has purchased the lighting plant of Norwich and will furnish the village light in the future. A number of New York capitalists have stock in the new enterprise.

Ravenswood, W. Va.—At a recent election it was voted to issue bonds for putting in an electric light plant.

Roseville, Ill.—There is talk of the Electric Light Company putting in a new and larger set of machinery in the spring.

Sacred Heart Minn.—The citizens of this place are agitating the question of erecting an electric light plant.

Saugerville, Me.—It is currently reported that an electric light plant will soon supersede the present system, which will have capacity sufficient to supply all those who desire good lighting at a moderate cost.

Sayville, N. Y.—At a meeting of the recently organized Sayville Electric Company it was voted to triple the capacity of the plant. New machinery will be installed.

Scotland Neck, N. C.—This place proposes new developments in graded schools, electric lights and water-works.

Scribner, Neb.—The citizens of this place are agitating the question of erecting an electric light plant.

Seattle, Wash.—The Seattle Electric Company makes a cut in cost of lighting, which varies from 10 to 50 per cent.

Street Railways.

Akron, O.—The entire line of the A B C Electric Road between this city and Cleveland will be double tracked next summer.

Atlantic City, N. J.—A syndicate composed of Philadelphia & Atlantic City capitalists has secured control of the Carbon County Electric Railway, operating between Mauch Chunk to Leighton and Weissport, Pa. Over \$1,000,000 will be spent in improving and extending the road, it being the intention to construct a line through to Allentown, a distance of 56 miles.

Buffalo, N. Y.—A trolley road is projected from Toronto to this city, about 150 miles, in connection with the Pan-American Exposition.

Canastota, N. Y.—The proposed electric road from here to Morrisville is practically assured.

Columbus, O.—It is reported that Ohio capitalists have projected an electric railway to traverse the Canadian Province of Alberta, thus providing a short rail and water freight line to the Klondike, and a short rail and water route to the Arctic Ocean. It is proposed to start the road at Edmontown.

Detroit, Mich.—The Detroit & Chicago Traction Company was incorporated last week with an authorized capital of \$4,000,000, and its object is to construct an electric railroad from this city to Chicago, as well as lines in various cities and villages of Michigan and Illinois. P. H. Flynn, W. A. Boland and other New York capitalists are back of the enterprise.

Durand, Mich.—The council recently granted a franchise to W. R. Benson and H. S. Hadsall of Owosso to operate and maintain an electric railway system in this village.

Lansdale, Pa.—The Lansdale & Norristown Electric Railway has been incorporated for \$60,000 to build a trolley line from this place to Norristown. Geo. H. Young is president.

Marinette, Wis.—H. C. Higgins of this city, with his brother Mayor Higgins of Neenah, propose to build an electric line from Mishicot to Green Bay during the summer.

Mullica Hill, N. J.—It is stated that the charter under which the proposed new electric road will be operated, running from Salem to Woodbury, via this place, will admit of the carrying of express matter. Farmers expect to ship milk over the road.

Nashua, N. H.—Hon. Charles S. Collins, of this city, makes an offer that if the New Hampshire Legislature will grant the proposed charter to the company in which he is interested for an electric road between here and Concord, he will build, at his own expense, the proposed State road between the Massachusetts line and the city of Manchester, a distance of 25 miles.

New London, Conn.—A force of men is engaged in surveying for the contemplated electric road between here and Westerly.

Paris, Ill.—Andrew J. Hunter and United States Marshal Hitch are heading a syndicate of Edgar County capitalists to construct an electric line from here to Clinton, Ind., 30 miles long, at a cost of \$250,000. The road is to be in operation next fall.

Rochester, N. H.—There is a move to build an electric railway from Concord to this place via Epsom.

Rochester, N. Y.—The State Railroad Commission will go over the line of the Buffalo, Niagara Falls & Rochester Electric Railway prior to the continuation of the hearing, February 14.

Saco, Me.—The Legislature is to be asked to grant a charter for a twenty mile electric railway between here and Steep Falls.

Somerville, N. J.—A trolley line is projected in Somerset County to run from here to Far Hills, by the way of Pluckemin. It is backed by James Brown, Jr.

Manufacturing.

Chester, O.—A new manufacturing enterprise, capitalized at \$100,000, is being organized here for the purpose of manufacturing porcelain electric light specialties. Among those interested are N. G. Macrum, of East Liverpool; W. B. Hill, Harry Peach, Dr. W. A. Hobbs and S. C. Williams. M. H. Hulings will be general manager of the concern.

Cincinnati, O.—The Bullock Electric Manufacturing Company has secured a \$12,500 contract for several motors from Mr. Crespo, manager of the "El Diario," of Buenos Ayres. This same concern has also secured a contract for the equipment of a generating plant in Tasmania, the value of which will exceed \$11,000.

Memphis, Tenn.—The charter of the Dixie Electro-Magnet Company was recently filed for registration. T. M. Galbreath, B. B. Beecher, Wm. Richardson, Frederick Thelengerder and Walter Goodman are interested in this concern, which will manufacture and sell electric dynamos, motors, engines and electric appliances. The capital stock of the company is \$30,000.

White Plains, N. Y.—The Fleming Motor Vehicle Company was organized lately. The objects are to manufacture and sell engines, stationary or locomotive, for land or marine purposes, and to buy or sell any boats or vehicles to which the same may be attached. The place of business named is the town of Ossining.

Company Matters.

Cleveland, O.—The contract for the signal service system for the fire department was recently awarded to the Gamewell Fire Alarm Telegraph Company.

New York City.—The annual meeting of the stockholders of the Edison Electric Illuminating Company will be held February 12. The transfer books will be closed February 9 to February 13.

Newark, N. J.—A consolidation of electric interests was effected last week at a meeting at the office of L. D. Howard Gilmour, when practically the entire control of the electric lighting-plants in Essex, Union and Morris Counties was centered in the United Electric Company, which was recently organized, with a paid up capital of \$20,000,000.

Niagara Falls, N. Y.—The Taylor Electric Signal Company of Buffalo is considering the question of removing its plant to this city.

Power and Transmission.

Grand Junction, Col.—Hon. Geo. Smith is seeking for capital to erect an immense electric plant at Cameo and to transmit the generated electricity to this place for any purpose desired.

Portland, Ore.—An electric power plant will be built near the Sandy River, at the confluence of the two forks of Gordon Creek, and will have about 25,000 horse power. Back of this enterprise are Hon. H. W. Corbett and associates in the City & Suburban Railway Company.

Automobiles.

Cottage City, Mass.—It has been proposed to buy the franchise and property of the Cottage City Street Railway Company and to operate a line of public automobiles between here and Edgartown. W. M. Butler is interested in the scheme.

Hartford, Conn.—The police commissioners have recently signed a contract with the Electric Vehicle Company for an electric patrol wagon. It is to cost \$3,000 and is to be ready in three months.

Middletown, Conn.—Judge Prentiss recently issued an order in the Superior Court authorizing Frederick A. Betts, receiver of the Keating Bicycle & Automobile Company to continue the business which is located here four months longer, and to borrow not exceeding \$50,000 for that purpose.

Stamford, Conn.—The International Power Vehicle Company, of New York, has leased H. B. Smart's factory building, and will begin there the manufacture of automobiles with a force of 200 men.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16% @ 16% c.; Lake, 16% @ 16% c.; casting, 16% @ 16% c.

The directors of the Hartford (Conn.) Electric Light Company have declared a semi-annual dividend of 3½ per cent., payable February 15.

The Detroit United Railway Company has declared a quarterly dividend of 1 per cent., payable March 1. Books close February 15 and reopen March 2.

The annual meeting of the stockholders of the Commercial Cable Company will be held in New York on March 4. Books close February 21 and reopen on March 5.

Stockholders of the Metropolitan Street Railway Company of New York will meet February 8 to consider the issue of \$1,400,000 bonds for extensions and improvements.

Wall Street is again filled with rumors of a pending deal between the Metropolitan and Manhattan roads of New York. The New York Central is now connected with the deal.

The adjourned meeting of the stockholders of the Brooklyn Rapid Transit Company was held on February 1, but immediately adjourned without day and without taking any action.

It is understood that negotiations have been completed by which the United Electric Company of New Jersey secures control of all the gas and electric lighting companies in Northern New Jersey.

A dispatch from Boston states that the trustees of the Street Railway & Illuminating Properties have declared a distribution of \$3 per share on February 7 to holders of common stock February 2.

It is said that the street railway system of Detroit has been sold to a syndicate, of which Henry A. Everett of Cleveland, O., is the head. The company organized to purchase the property is capitalized at \$23,500,000.

The annual report of the Independent Union Telephone Company of Buffalo, N. Y., recently filed, shows that 150 shares have been actually issued. The whole capital stock of the company is \$200,000, divided into 2,000 of \$100 each.

The South Side Elevated Railroad Company of Chicago reports for the year ended December 31 last: Gross earnings, \$1,286,635; operating expenses, \$748,402; net earnings, \$538,233; deducting interest and dividends there remains a balance of \$197,720.

Common stockholders of the Schuylkill Traction Company of Philadelphia have been notified that under the readjustment plan they may not later than February 16 exchange their holdings for 25 per cent. in preferred stock at the Fidelity Trust Company's offices.

The authorized capital of the Electric Vehicle Company is now \$9,000,000 preferred and \$11,000,000 common stock, of which \$8,125,000 and \$10,450,000, respectively, is now outstanding. Comparing this with previous reports of the company, it would appear that the payment for the Riker Motor Vehicle Company was made with \$725,000 preferred stock and \$1,050,000 common stock.

The stockholders of the New York & New Jersey Telephone Company will hold a meeting in Brooklyn on March 1 for the purpose of voting on a proposition to increase the capital stock of the company from \$8,000,000 to \$15,000,000. It is the purpose of the directors to offer the new stock to the present shareholders from time to time in such amounts as may be needed in the construction requirements of the company.

A special meeting of the stockholders of the Westinghouse Electric & Manufacturing Company will be held on February 20 at the general office of the company at East Pittsburgh, Pa., for the purpose of voting for or against an increase of the capital stock of the company, such new stock to be made second preferred stock, otherwise known as "assenting stock." The transfer books closed on February 5 and reopen February 21.

The Central Electric Company has awarded to J. S. Rippel of Newark, N. J., \$150,000 of its \$750,000 five per cent. first mortgage forty-year gold bonds. The mortgage covers all the property now owned or hereafter acquired, including plants in Rahway, Perth Amboy, New Brunswick, Bound Brook, Dunellen and Metuchen. The proceeds of the present sale will be used to defray the cost of extensions at the new plant at Metuchen. The bonds are dated July 1, 1900; interest payable January 1 and July 1; trustee, Fidelity Trust Company of Newark.

At the annual meeting of the stockholders of the Erie Telegraph & Telephone Company on January 31 the by-laws were amended changing the date for the annual meetings to the Thursday preceding February 1 in each year. They also decided to reduce the board of directors from 25 to 15. The new board of 15 was then elected and is as follows: Edward Abbott, Walter Abbott, A. B. Chandler, Frank A. Cutting, Philip Dexter, William Endicott, Jr., Frederick A. Farrar, Reginald Foster, Charles J. Glidden, Francis R. Hart, William J. Latta, Frank M. Riter, James J. Storrow, Charles S. Tuckerman and Henry R. Wilson.

The annual general meeting of the shareholders of the Ottawa (Can.) Electric Railway Company was held at Ottawa on January 30. The annual report and financial statement for the year ending December 31 last showed a most satisfactory year's business. Four quarterly dividends of 2 per cent. each were paid and a substantial balance carried to the credit of profit and loss. There were 7,940,656 passengers carried during the past year, making an increase of about 2,000,000 over the year previous. The following directors for the current year were elected: T. Ahearn, George P. Brophy, Peter Whelen, Warren Y. Soper, Thomas Workman, A. Lumsden and Hon. Senator Cox. Mr. T. Ahearn was elected president, Peter Whelen vice-president and James D. Fraser secretary-treasurer.

EDITORIAL NOTES.

The Street Railways of Massachusetts.

It is no exaggeration to say that in no State in the Union is the subject of street railways and street railway regulation given such thorough attention as in Massachusetts. As a result, many of the electric lines are in a thriving condition, and pay dividends to the investors, which is by no means always the case in other States, owing too frequently to a generous dilution of the capital stock of a company with water.

An advance copy of the thirty-second annual report of the Board of Railroad Commissioners of Massachusetts has just been issued, which contains a vast amount of valuable information, especially from the point of view of the street railway investor. The report is for the year ending September 30, 1900, and gives statistics relating to 118 street railway companies, or two more than in 1899. At the end of the year 72 out of the 118 companies were operating their railways; the railways of 14 companies were operated by other companies under lease or contract; 9 companies had organized and were constructing their railways; three companies had organized and paid in a portion of their capital stock, but had not commenced the construction of their railways, while 20 companies had been consolidated with other companies during the year.

The report shows that there are 2,037.74 miles of single track owned, an increase over 1899 of 192.03 miles. Of this total amount of track 1,972.55 miles are being operated; 4.75 miles by horse power, the balance by electricity. The fact that there are but 4½ miles of horse car lines in Massachusetts certainly speaks well for the progressiveness shown by the inhabitants of the State.

In 1860 there were but 20 street railway companies in Massachusetts operating 88.87 miles of track by means of horse power. In 1889 there were 50.5 miles of electrically operated roads against 523.65 miles of track on which the cars were operated by animal power. During 1891-1892 there were 207.3 miles of electric roads built or converted from horse power to electricity, which left 258.55 miles of the former as against 496.3 miles of the latter.

The average cost of the street railways of Massachusetts per mile of main track (includ-

ing the cost, but not the length of side track), as it stood on the books of the companies September 30, 1900, was \$23,443.43 for construction; \$8,510.13 for equipment, and \$11,683.82 for lands, buildings (including power plants) and other permanent property—making a total average cost of \$43,637.38 per mile of main track. The gross assets of the companies on the date mentioned above were \$98,700,074.53.

The total capital investment (capital stock and net debt) of the companies in question advanced the last year from \$68,758,800 to \$77,226,214. In 1888 the total was only \$17,237,100; so that the capital investment has more than quadrupled since the introduction of electricity as motive power.

The total amount of dividends declared the last year was \$2,409,874—an increase of \$91,476 over the preceding year. Forty-eight out of the 118 companies paid dividends; 14 paid 8 per cent.; 1 paid 8 per cent. on preferred, and 7 per cent. on common stock; 3 paid 7 per cent.; 1 paid 6½ per cent.; 12 paid 6 per cent.; 2 paid 5 per cent.; 1 paid 4½ per cent.; 1 paid 4 per cent.; 3 paid 4 per cent.; 1 paid 3½ per cent.; 3 paid 3 per cent.; 3 paid 2½ per cent.; 2 paid 2 per cent. and 1 paid 1 per cent.

The amount of the capital stock upon which dividends were paid of the 48 dividend-paying companies was \$38,901,700.00, on which the average rate was 6.19 per cent.

The total number of passengers carried on all the roads during 1900 was 395,027,198, or an average of 51 passengers per round trip.

An interesting part of the report is that which deals with the cost of operation per car mile. In 1891 the average expense of operating a car one mile was 24.38 cents; whereas in 1900 the cost was 16.10 cents. The expense of operation per passenger carried is given as 3.33 cents.

Mention is made in the report of the wisdom of the legislation known as the "Anti-stock watering laws," which restricts original issues of street railway securities to the amount requisite for cost of construction and equipment, and forbids additional issues where the capital or assets have become impaired until such impairment is made good, and prohibiting the issue of bonds unless the physical assets of the company are equal to its aggregate outstanding indebtedness.

Taking it all in all the report is replete with valuable information and statistics, which goes to show the thoroughness with which the Railroad Commissioners have examined into

the subject. It might further be added that this report should be in the hands of all persons interested in electric street railway undertakings.

* * *

Some Experiments in Wireless Telegraphy in This Country.

Reports have reached this country from abroad of the numerous experiments in wireless telegraphy that have been going on with a view to perfecting the Marconi system for signaling between a land station and a ship at sea. Exhaustive tests of this nature have been carried on with boats crossing the English Channel, it being no unusual thing to transmit intelligible messages a distance of from eighty to ninety miles. We now hear of some experiments the Weather Bureau in Washington has been making on the quiet for about a year with a system of wireless telegraphy which is said to differ materially from that of Marconi. Referring to the subject Prof. Willis Moore of the Weather Bureau is reported as saying:

"We have succeeded in telegraphing perfectly with our wireless system for sixty miles over a rough country around Washington.

"About a year ago we secured Cobb's Island, sixty-five miles down the Potomac. We wanted privacy. We have worked down there for a year, and we put up workshops and towers whenever we needed them, but so far as I know the newspapers of the country have not even heard of the existence of the plant.

"Prof. Fessenden was in charge, with two assistants and a force of laborers. As often as possible Prof. Abbey and myself of the Bureau would go down to help.

"The tests started with experiments in transmitting the ethereal vibrations at fixed distances, under varying conditions. Then we tested the wireless transmission of waves.

"As a result we have developed apparatus of our own that is quite distinct from the machinery used by Marconi. In fact our methods and his are altogether different. What those methods are, however, I do not wish to say.

"We succeeded in sending messages for some distance from a staff only three feet high. The transmission of wireless messages was not limited to the island. We established communication between the laboratory and Washington, a distance of about sixty miles over a rough country.

"On a farm near Fort Meyer, just across the river from Washington, was a staff about one hundred feet high on the place, and at the top of it we placed our instruments. We were able to communicate with the islands freely as though we were working over a wire.

"We used a system of dots and dashes, and our receiver was of the 'sounder' type. We read messages by sound. We expect, however, to develop a receiver that will record messages."

A dispatch from Washington states that with this system it will be feasible to signal ships at a distance of 500 miles or more out at sea. As no authority is given for this statement it is scarcely to be credited, and may safely be put down to the imaginings of an enterprising representative of the daily press.

It is interesting to note however that besides the wireless telegraphy station at Roanoke, N. C., there will shortly be two others erected, one at Hatteras and the other at Cape Henry.

A New Electrical Law.

Nikola Tesla claims to have discovered a new law in electrical science which will necessitate the rewriting of most of the text books now in use. He asserts that the capacity of an electrical conductor, such as a metallic sphere, varies under different conditions, and that he has found out the law which governs this phenomenon. Referring to the subject he says:

"Electricians and physicists have assumed that the electrostatic capacity of a conducting body, say of a metallic sphere, which is frequently used in experiments, remains a fixed and unalterable quantity, and many scientific results of the greatest importance are dependent on this assumption.

"Now, I have discovered that this capacity is not fixed and unalterable at all. On the contrary, it is susceptible to great changes, so that under certain conditions it may amount to many times its theoretical value, or may eventually be smaller.

"In estimating the wave-length of the electrical vibration in the transmitting and receiving circuits, due regard must be had to the velocity with which the vibration is propagated through each of the circuits, this velocity being given by the product of the wave length and the number of vibrations a second—the rate of vibration being, however, as before stated, dependent on the capacity and inductance in each case. I obtained discordant values.

"Continuing the investigation of this astonishing phenomenon I observed that the capacity varied with the elevation of the conducting surface above the ground, and I soon ascertained the law of this variation. The capacity increased as the conducting surface was elevated, in open space from one-half to three-quarters of one per cent, per each foot of elevation. In buildings, however, or near large structures, this increase often amounts to 50 per cent, per foot of elevation, and this alone will show to what extent many of the scientific experiments recorded in technical literature are erroneous.

"Far more interesting, however, for men of science is the fact discovered later that the capacity undergoes an annual variation with a maximum in summer and a minimum in winter. In Colorado, where I continued with improved methods the investigations begun in New York, and where I found the rate of increase slightly greater, I furthermore observed that there was a diurnal variation with a maximum during the day and a minimum during the night. Further, I found that sunlight causes a slight increase in the capacity. The moon also produces an effect, but I do not attribute it to its light."

This statement of Mr. Tesla's is extremely interesting and should furnish electrical scientists an opportunity of airing their views on the subject.

A few months ago a special committee was appointed by the City Council of Montreal to report upon the best course to adopt in regard to the electric lighting of the city, upon the expiration of the present lighting contract with the Royal Electric Company. The committee did not favor municipal ownership, but recommended that public tenders for the new lighting contract be called for, and that the specifications contain certain conditions which do not apply to the existing contract. The

following objections to municipal ownership were given: That it would cost the city an immense sum to purchase such a plant; that the city would find it costly to operate such a plant by steam power; that there was an unfavorable outlook of getting water power, without purchasing it from the companies, on account of so many water power companies operating water plants in the vicinity of Montreal; that if water power was bought, it would cost the city as much to manufacture electricity, as if produced by coal; and, finally, under these conditions, it would be better to give the lighting out by contract and to have the keenest private competition for the service.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE annual meeting of the American Physical Society will be held in New York on the 23d inst.

DURING the year 1900 the capital involved in electrical undertakings in Great Britain was increased from \$525,000,000 at the beginning of the year to about \$625,000,000 at its close. This is exclusive of Government telegrams and telephones, the greatest increase being in connection with the supply, traction and manufacturing works. In five years the total capital has been doubled, and in electrical manufacturing alone the five years have shown an increase from \$32,500,000 to \$110,000,000, \$25,000,000 being for the year 1900. In the electric traction, lighting and power interests the increase in the same time was from \$70,000,000 to \$275,000,000, and is likely to be still further increased in the next year or two, as in 1900 ninety-eight provisional orders were granted by Parliament, and many of the eighty-nine stations authorized in 1899 are not included in the capitalization given.

LLOYDS have been in communication with the Canadian Department of Marine on the subject of establishing one of their reporting stations on Belle Isle, off the coast of Labrador, and they have been assured of the active assistance from the department in their project. They are also considering the feasibility of connecting Belle Isle with the mainland by a system of aerial telegraphy, so that communication would not be interrupted by a break in the cable.

THERE are some 310 vessels with more than 2,000 men employed in the sponge industry about the coast of Florida. As it takes at least a year for a sponge to grow to a moderate size, and the grounds are fished over several times every twelve months, the large sponges have all been removed from the available portions of the ocean's bed, and the great fleet of fishing vessels keep the product limited to sponges of small value. The United States Commission of Fish and Fisheries has recently taken steps towards the regulation of this wholesale destruction of the young sponges on those submarine plateaux which are now accessible. The operation of collecting the sponges is very simple, the fisher spearing with a long pole all those which he can see by the aid of a water-glass. The depth of water, therefore, in which they can be obtained is only limited by the distance penetrated by the light. If this distance could be increased, large areas would im-

mediately be open up where sponges have been growing unmolested for years, and the production would be not only greatly increased in quantity, but the quality would probably be as fine as that from any part of the world. Experiments are soon to be made upon a new submarine electric arc lamp to ascertain by practical demonstration the feasibility of reaching these lower strata by its means, and if successful its application to this important industry will undoubtedly follow.

A RESIDENT of St. Louis has patented an electrical race horse starting gate.

A SWEDISH engineer, Herr Kjellin, manager of the Gysinge Iron Works, claims to have invented a method for the manufacture of steel by electric power, of which the details will be made known as soon as the process is patented, says the "Electrician," London. The quality of the steel is claimed to be excellent, and the cost of production low. At present he is turning out only about a ton a day, owing to the want of electric power at the works; but plans are being prepared for obtaining sufficient power from the falls in the River Dalelven, some distance from the works, where a powerful generating station is to be constructed, when the steel manufacture will be carried out on a large scale.

GERMAN experiments in applying X-rays to old masters to establish their authenticity has created considerable talk and interest in local art circles. Experts here are not wholly agreed upon the subject. According to special cable dispatches in the "Herald" from Berlin, a work in Ratlsbonne, which was supposed to be a Durer, dating back to 1521, was subjected to X-rays, with the result that Durer's monogram and the date 1524 were revealed. The painting was on silk, stretched over an oak board two centimeters (.79 inch) thick.

A BILL intended to prevent "record automobile trips" was introduced at Albany last Friday by Assemblyman S. W. Smith of Columbia County. The bill provides that the boards of supervisors of each county shall have power to enact local and private laws limiting the speed of all vehicles within their respective confines.

Gov. DUBIN of Indiana recently signed the bill providing for the electrocution of murderers instead of hanging them.

A FRENCH experimenter, according to the N. Y. "Sun," has devised a differential apparatus which, while not preserving the secret of wireless telegraph messages, enables the sender to communicate at will with one or the other of two stations situated at different distances. This scheme involves the use of four mast-wires of different ranges, two at the sending stations, and two at the receiving stations. The heights of the masts are so arranged that one of them covers, say, a range of five miles, while the other does not. By this means, it is asserted, the object sought can be attained.

A DISPATCH from London states that the completion of the great Nile dam at Assuan, so far as to practically control the flow of the river, was announced last week by Sir John Aird, the contractor. His message was: "The last channel has been closed at Assuan. You

can now walk across the Nile." This will solve the problem of providing corn in Egypt. The excellent piece of dam construction will have to withstand a severe strain when the Nile rises with the next floods.

THE War Department recently made public another large portion of the Taft Commission's report, dated at Manila, of which the most important part is that relating to the market for American products in the Philippine Islands. It is stated that there will be a steadily increasing call for American electric machinery. At present Manila is the only city in the islands which has electric lights, the small plant at Iloilo having been burned. There are no electric railways in the islands, and it seems certain that there will be a great future for them there.

A REFUSE destructor and electric generating plant is to be erected in London in the suburb of Hackney. Apparatus will be installed having an initial capacity of 3,000 horse power, which will be sufficient in connection with storage batteries to supply current to 50,000 eight-candle power incandescent lamps. The refuse destructor will consist of twelve furnaces with a daily consuming capacity of 150 tons. The cost of the plant will amount to about \$1,250,000. The charge for electric lighting to both private and public consumers will be at higher rates than for the supply of power.

A BILL has been introduced in the Legislature at Albany, which if passed, will give the Railroad Commission of New York State full authority over gas and electric lighting, heating and power companies.

A SYNDICATE has been formed which intends to consolidate all the street railway lines in the more important cities in Northern Indiana, Northwestern Ohio and Southern Michigan and the interurban roads. The first step in the deal was the transfer recently of the Lafayette city lines to a company with \$800,000 capital, composed of Eastern and Western financiers. New York and Philadelphia capitalists are interested, but their names have not been made public.

SOME tests have been carried out by the German Post Office officials on the new electric tramway at Bielefeld, to ascertain whether the protection of telephone and telegraph wires crossing above the trolley wire was sufficient. Above each trolley wire at places where wires of the other service cross it are copper guard wires, directly connected to the rail return of the trolley line system. On a telephone wire falling over the trolley wire it first came in contact with the guard wire, and then short-circuited this to the trolley wire, causing the cutout in the station to come into action. So effective is this said to have been that, in three experiments, the delicate fuse at the far end of the telephone wire was in no case melted. The only novelty, if any, says the London "Electrician," appears to be in earthing the guard wire directly to the rails instead of merely to the pole or an earth plate. Everything of course depends on the adjustment of the station cut-out, but the expedient of connecting the guard wire directly to the rails, and so to ensure as effective a short-circuit as possible, in the event of contact between the telephone wire and the trolley wire, appears a good one.

THE latest and most practical use to which an electromobile has been put occurred the other day in Boston, when one of the vehicles was used to pull a horse out of a hole in the street into which he had fallen and where he was stalled.

A NEW apparatus has recently been invented abroad for examining boiler tubes. It consists of a tube fixed at right angles in a chamber provided with a magnifying eye-piece. At the further end of the inspection tube, which is capable of being drawn out to suit the length of the boiler tube under examination, is an incandescent electric lamp, and an angular plane reflector which transmits the rays to a reflector inclined at a similar angle under the eye-piece. The tube in process of inspection is fixed in a traveling carrier, which permits every part of it to be examined in turn. The carrier is provided for this purpose with both a horizontal and a rotary movement. The present apparatus is designed for tubes of 6.56 feet in length by 1½ inches in diameter, but the same principle can be applied to tubes of larger size and greater length. An apparatus for use in the case of tubes "in situ" has also been devised. It is stated that this invention has proved very satisfactory in use, and that it has often revealed defects in the interior of tubes which externally presented every appearance of soundness.

AN electrician of Albany has applied for a patent on an electric mail box, which is intended for houses. It is small, and is so arranged that when the letter carrier deposits a letter in the box he presses a push button, which is connected with an annunciator within the building. A drop comes down showing the word mail. The household knows at once that the mail is at the door. Any mail for the carrier is placed on the box, where there is a wire rack for papers. The battery is in the top of the box, and not in the house. It is readily accessible and requires but little attention, no more than an ordinary electric door bell.

THE Brussels correspondent of the London "Globe" states that the attempts to communicate from Brussels to Antwerp, and vice versa, by means of Marconi's system of wireless telegraphy, have proved failures. M. Guarini, who conducted the experiments, expresses himself disappointed, but by no means disconcerted, although he cannot explain the cause of several of the trials being unsuccessful. The experiments were made between Brussels and Antwerp direct, without using the intermediate repeater at Malines. In a few days' time an attempt will be made to telegraph atmospherically over the shorter distance.

A RESIDENT of Hanau-on-the-Main, Germany, has taken out a patent on a method of soldering aluminum. The process is based on observations, which had not previously been made, that aluminum becomes soft at a certain temperature, at which, by hammering, it can be joined to another piece heated to the same temperature in such a manner as to give an absolutely homogeneous whole. The surfaces to be united are brought together to a temperature at which the metal commences to soften, but without forming the skin of oxide, which hinders welding; the said surfaces are then hammered or worked in any way until the joint has, so to speak, disappeared and the two surfaces form a solid body.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 14.

ALTERNATING CURRENTS.

An alternating current is one that is continually reversing its direction of flow, and is generally understood to be a current that reverses its direction at every pulsation. A good example of an alternating current is that which is produced by an ordinary magneto generator, such as is used in telephone work. A magneto generator is made up of a single coil of wire which is revolved between two magnetized pole pieces, the terminals of the wire being connected to two points which are kept continually in contact with the exterior circuit by means of brushes.

The ordinary alternating current dynamo or alternator is constructed on this same principle, but is usually made with a number of coils on the armature and an equal number of poles in the field magnets.

An alternating current is said to make as many alternations per minute as it makes changes in direction in each minute. Instead of speaking of the number of alternations per minute of an alternating current, it is quite common to speak of its frequency, which is the number of double alternations made by the current per second. The number of alternations per minute that an alternating current dynamo will give out is equal to the number of pole pieces in the field magnet multiplied by the number of revolutions made by the armature per minute. To find the number of alternations per second, divide by 60, and to find the frequency divide the result by 2, for a frequency is a double alternation. So to find the frequency of a machine, divide the alternations per minute by 120.

An alternating current when applied to operating an incandescent lamp has just the same effective value that a direct or continuous current would have, that is to say, an alternating current operating at 110 volts pressure would give practically the same results on lighting a 110 volt incandescent lamp that a direct current of 110 volts would give, also the amount of current flowing through the lamp would show to be the same in each case, if measured with properly calibrated and correct reading ammeters. The amount of power used in each case could be indicated by $C \times E$ and would be correct.

However there is one very important point in which alternating currents differ radically from direct or continuous currents. Now suppose we take a long piece of copper wire having a resistance of 110 ohms, a direct current operating at 110 volts would, according to Ohm's Law, force one ampere of current over that resistance and it would do that regardless of whether the wire be laid out straight, coiled up, or wound on an iron core. It does not change the actual resistance of the wire any to place it in any of these forms and therefore the direct current of 110 volts would force a flow of one ampere over it just the same. This would not be so, however, were an alternating

current of 110 volts applied to these conditions. When the wire is laid out straight there would be one ampere of current flowing just the same as when the direct pressure was applied, but when the wire is wound in the form of a coil then the amount of current flowing will be reduced and further if the wire be wound on a laminated iron core the amount of current flowing will be very greatly reduced, in fact there may be practically no current being forced through at all if the conditions are just right.

You might say here that an alternating current is not governed by Ohm's Law because you know the resistance of the wire has not been increased. Alternating currents are governed by Ohm's Law, however, but a peculiar condition comes into play in this case, which I will try to explain, and upon this governing condition depends almost all the effective value of alternating currents.

On account of self-induction, either an increase or decrease of current in a coil is retarded by the magnetic effect of the different turns of the coil tending to stop any change in the current. There is practically no effect of self-induction in a wire when it is laid out straight, but when coiled up then the law makes itself known to a certain degree, because the magnetic effect of each turn of wire is acting on each other turn. This effect is magnified to a large degree when the wire is wound on an iron core, because the iron largely increases the magnetic effect of the turns and consequently increases the self-induction of the coil.

If a direct current be applied to send a flow through a straight wire, the current will rise to its full value almost instantly, that is, to the amount of flow governed by Ohm's Law. When the same wire is coiled up and connected to the same direct pressure, the current will not reach its full value so quickly on account of the retarding effect of self-induction. Now if the same wire be wound on an iron core the current will not reach its full value for quite an appreciable period of time, because the self-induction has so much greater retarding effect on account of the added influence of the iron.

Although it takes the current longer to reach its maximum value in this case than if the wire were laid out straight, yet when it does the amount of flow will be just the same. After it has reached that point the self-induction has no retarding effect, or in fact does not then effect the current at all, because self-induction can only have an effect when a current is changing in value.

An alternating current is continually changing its value so the self-induction will be acting upon it all the time. While the current is tending to increase in value, the law of self-induction is holding it back and when the current is falling or decreasing in value, the tendency of the self-induction is to keep it from changing. The result is that in a circuit that has self-induction, an alternating current will always be retarded, which causes the maximum value of the current to be smaller than it would be provided there was no such effect.

The effect of self-induction in decreasing the amount of alternating current which flows in a circuit depends upon the magnetic effect which the circuit has upon itself and also on the rate of alternations of the current. You can readily see why the alternations must necessarily be quite rapid, for if the electric pressure be kept long enough in one direction the flow

would reach its full value the same as with a direct current, that is, by continuing the pressure long enough in each direction the retarding effect would be overcome.

Then the resistance of a circuit to an alternating current must be equal to the dead resistance of the wire plus the effect of the self-induction. The dead resistance of the wire depends only upon its length, cross section, and the material of which it is made, while the self-induction depends upon the magnetic effect which the circuit exerts upon itself, and also upon the frequency of the current.

Alternating currents are very much used for the distribution of electricity for the purpose of electric lighting, because by this means a high voltage can be maintained on a feeding circuit and reduced by the use of transformers at any convenient point where lights are to be used.

The fact of being able to use a high voltage permits of currents being sent quite a distance from the source of generating and at a small loss in efficiency; also considerable power may be sent over small copper carrying capacity, thus saving considerable in the expense of constructing a plant.

Article No. 15, will be entitled "Transformers."

THE BARMEN-ELBERFELD SUSPENDED RAILWAY.*

In the presence of a notable company, including the Imperial State Secretary and the Prussian Ministers concerned, and many leading men in commerce and industry, the Suspended Railway of Barmen-Elberfeld was opened on Wednesday, October 24. The cars are suspended, after the manner of a bucket on a wire rope-way, from a single rail mounted overhead upon an iron framework. The railway is 9.37 miles long, and there are twenty stations. It begins at the Barmen-Rittershausen Railway Station, and goes through the towns of Barmen and Elberfeld, following the course of the Wupper, as was inevitable, owing to the many houses and the narrowness of the valley. Just beyond Elberfeld it leaves the river and follows the road through Sonnborn to Vohwinkel, where it ends near the railway station there. At present the Elberfeld portion is working; the Elberfeld-Vohwinkel section will be finished in the winter, and the Barmen portion in 1902. The railway follows the fall of the river, and rises in accordance with the somewhat steep ascent of the road from Elberfeld to Vohwinkel. There will be 17 stopping places altogether, four in the Barmen part, eleven in the Elberfeld part, and two in the Vohwinkel part, the distance between them varying from 300 to 330 yards. The lower edge of the carriages is always at least 14 feet 9 inches above the level of the road, and 11 feet 6 inches below the rail, which is therefore 26 feet 6 inches in the air.

The two lines, the up and the down, have only one rail each, which is supported by an iron framework, consisting of a series of iron girders sustained by supports. These supports are far apart along the river, and are fastened in the river walls for an abutment, as piles cannot be sunk in the loose river-bed. Along the road the supports are arches of sheet iron resting on plaster abutments. The peculiar form of these supports excluded the use of any other metal than iron.

At each of the termini the up and down

*From the "Tramway and Railway World," London.

lines are connected with each other to allow of a continual quick succession of trains. As some of the trains only run between Barmen and Elberfeld, and do not go on to Vohwinkel, a similar contrivance has been constructed at the last Elberfeld Station, the Zoological Gardens. There is also a temporary one at the Kluse-Bembergstrasse stopping place, as the whole Barmen section is not yet finished.

The carriages depend from the fixed over-

front of the first carriage. An electric brake and a through action pneumatic brake, as well as hand brakes, are provided, and these can be set working from different parts of the train. A conductor wire is attached to the iron support of the rail, from which the current is taken. The current is supplied by the newly-built electric works at Elberfeld, and it has a mean tension of 580 volts. The carriages are lit by clusters of

on the picturesque banks of the Schlei, not far from Hamburg, and at the entrance to the bay of Kappeln on the Baltic. A special windmill to test the new idea has been constructed by Herr C. P. Neumann, of Wittkiel. This has a diameter of 39 feet, with a wind surface of 326 square feet. It can develop 30 horse-power, with a speed of 10 revolutions a minute. It drives a dynamo which, running at a speed of 700 revolutions, furnishes a current of 120 amperes at 160 volts. The electrical output attains its normal value when the speed of the wind exceeds 9 feet per second. The dynamo is also employed to charge the accumulators which furnish a current of 110 volts used in lighting the town and in driving several small motors. The experiment having proved extremely satisfactory, a larger installation comprising several windmills and dynamos is under consideration, and we may again possibly see the mill forming a prominent feature of our own landscapes as in former years, though its purpose may be slightly different.

A METER FOR ALTERNATING CURRENTS.*

A meter for recording watt-hours in alternating current lighting circuits, characterized by great simplicity of construction and cheapness, has recently been introduced by the Allgemeine Elektrizitäts Gesellschaft, of Berlin. It is alleged that by the introduction of this invention the meter rent paid by consumers will be reduced to one-half its present amount.

The meter consists of a revolving disk, *A*, which is subjected to the action of two alternating magnetic fields differing in phase, which, owing to their special arrangement, impress a comparatively large driving force on the disk. The magnetic circuit is closed. The pressure bobbins, *s*₁ *s*₂, as well as the main current bobbin, *H*, are placed at one side of the disk, the three cores of the bobbins being connected to a single yoke, *x* (Fig. 1), and

FIG. 1.

the magnetic circuit completed by a single armature, *R*.

The operation of the meter is as follows: The two shunt bobbins, *s*₁ *s*₂, impart alone (without the main current) a fairly strong turning moment to the disk, either when the air spaces, *L*₁ *L*₂, of the two pressure cores are unequal, or when the magnetic force of the two pressure bobbins is different.

This turning moment would cause the meter to run when no current was flowing, and it must be reduced to an amount which is just sufficient to overcome the friction of the apparatus. This can be done by varying the number of turns or the air space; in the actual in-

SUSPENDED RAILWAY AT THE PARIS EXHIBITION (VINCENNES ANNEX).

head rail by means of two bogies, each of which is supplied with two wheels, and are at a distance of 26 feet 6 inches. By this means the carriages can easily pass sharp curves, as they hang freely, and can swing out to a considerable inclination sideways—15 degrees is allowed on the Elberfeld Railway. On account

small lamps contained in a large globe in the roof.

The cars will travel at a speed of 18.6 miles per hour, but it is stated that a much higher speed can be attained.

The constructors of the line, the "Continental Gesellschaft für Elektrische Unternehmungen," Nuremberg, made an exhibit at the Paris Exhibition, in the Annexe de Vincennes, of which we reproduce a photograph. The track was 200 feet long, and consisted of two bridges of 100 feet each, resting on three pillars. The bridges and car will be used again on the railway at Barmen. The track was in working order, but the company discontinued running the car on account of the shortness of the line, which gave no opportunity for showing the advantages claimed for the system. The constructors of the line have sent us two reports of a well-known expert on railways, Prof. Dolezalek, of Hanover, who is convinced there is a great future in store for the suspended railway. The professor recommends its adoption on the existing railways, as an overhead express service on which, according to the traffic, any number of carriages can be dispatched, traveling at a high rate of speed and subject to no interruptions, while the slow ordinary traffic may go on underneath.

Windmills and Electricity.

Windmills—except in Holland—have almost entirely gone out of favor for their original purpose, namely that of grinding corn, and are indeed but sparsely used even for pumping water, says the "Tramway and Railway World." They may, however, be more largely patronized in the future. It has been suggested that they might be employed in the production of electricity, and experiments having this for their object have just been made at Wittkiel, a little German village near Kappeln

INTERIOR OF CAR—BARMEN-ELBERFELD RAILWAY.

of the curves of the Wupper, curves of a radius of 297 ft. were requisite. The firm parts of the bogies, from which the carriages hang, are connected so closely with the iron support of the rail that it is impossible for the carriage to get off the line, even if the tire of a wheel or an axle breaks. An electric motor is attached to the upper part of the bogie, which drives the two wheels equally. All the motors of a train are managed by a driver in the

strument the latter is made adjustable. If the main current is now turned on, a mutual action takes place between the magnetic field of the main current and the vortex currents generated in the disk by the shunt bobbins on the one hand, and between the magnetic fields of the shunt bobbins and the vortex currents generated by the main current bobbin on the

FIG. 2.

other hand. The result is that the disk A is set in rotation.

The field of the main current bobbin acts upon the fields of the shunt bobbins so as to reduce one and increase the other, as shown in Fig. 4. The core of one of these bobbins would thus reach saturation point much sooner than that of the other, and the proportionality

FIG. 3.

would be disturbed. To prevent this, a part of the main current circuit is wound about one of the shunt cores, as shown in Fig. 2, to compensate for this inequality in the field. If the same effect were produced by winding different numbers of turns on the two shunt bobbins,

FIG. 4.

then, as stated above, the meter would run when the main current was not turned on, which is an insuperable objection to this method of compensation.

The speed of rotation imparted to the disk

FIG. 5.

in this way is directly proportional to the product of the current and the pressure. The apparatus, therefore, counts the number of watt-hours. The magnet, M, acts as a brake

to the disk. The rotations of the disk are transmitted to a counting mechanism, in the simplest way, by worm gear. The reading of the meter is in kilowatt-hours, and is shown in a single row of figures on the face of the counting mechanism, so that the consumer can at any moment, without trouble, read off the number of units which he has consumed, i.e., how much he owes to the electric supply company. No reduction of the reading is necessary, since the instrument is constructed so that the constant is always unity. The instrument, if properly set up, retains its original accuracy for any length of time. The percentage of error over the whole range of the instrument is shown by the curve, Fig. 5. It is evidently of some advantage to the consumer to work at full load.

A DOUBLE CURRENT POWER PLANT.

BY FRANK C. PERKINS.

It is frequently found necessary in the distribution of current for railway, light and power work, to supply both direct current and alternating current from the same power station. In many cases this is accomplished by using a combination in the same power house of both continuous current generators and polyphase alternating current machines, each directly connected to its own prime mover, whether turbine or steam engine. The direct current is usually utilized for local distribution for lighting or street railway work, while

FIG. 1.

Alternating Current Side Double Current Generator at Montmorency Falls.

the alternating current is raised in potential to 5,000 or 10,000 volts and transmitted over considerable distances. The current is then transformed down to moderate potentials, and used either directly as an alternating current for operating stationary polyphase motors as well as lights, or is transformed by rotary converters at those points to a direct current for use on railway feeder circuits.

In other cases only polyphase alternating current apparatus is installed in the power station, and the direct current necessary is supplied not only at distant points by rotary converters, but also by the use of the same class of apparatus located near or in the power station. An example of such an installation is located at Niagara Falls, where the main power house is supplied only with alternating current generators, the local direct current railway circuits being supplied by rotary converters in the main generator room of the Niagara Falls power house, while the railway feeders, ten or twenty miles away on the Buffalo & Niagara Falls Electric Railway Line are supplied from sub-stations at Tonawanda and

Buffalo, each sub-station being equipped with static step-down transformers and rotary converters for supplying the feeders at those points.

In some other cases, similar to the one about to be described, double current generators are installed in the main power house, arranged to supply both polyphase alternating currents

FIG. 2.—MONTMORENCY SWITCHBOARDS.

and 110 or 550 volt direct current from the same machine. The neighboring lighting circuits and the railway feeder circuits near the power house are then supplied directly through the switchboards from the commutator of the direct current side of the double current generator, while the distant points are supplied with a polyphase current from the brushes and slip rings on the alternating current side of the same machine.

A Westinghouse double current generator of this type is shown in Fig. 1, directly connected to a Victor turbine wheel at the power house of the Quebec Railway, Light & Power Company at Montmorency Falls, Can. This generator is a 600 kilowatt machine, and supplies a 500 volt continuous current to the local railway

FIG. 3.

Exterior of Power House Quebec Railway, Light & Power Co.

feeders from the direct current side, and a 400 volt two phase current from the alternating side, shown in Fig. 1. The frequency of this

current is 66 cycles per second, the armature having a speed of 286 revolutions per minute. This generator is directly connected to a 54 inch Victor turbine which develops 1,000 horse power at an available head of about 200 feet. The turbines and governors were installed by the Stilwell-Bierce & Smith-Vaile Company. The switchboards seen in the accompanying illustration, Fig. 2, are equipped with circuit breakers, and the many measuring instruments required in the power house for the various circuits.

The two phase alternating current, after passing the switchboard from the double cur-

rent machine is increased in potential by static step-up transformers to 11,000 volts, and is conducted to a sub-station more than a dozen miles away at St. Anne's de Beaupre, where rotary converters are employed for changing the two phase alternating current to a direct current for supplying the railway feeders at those points.

ernor will shut down to a normal speed, and keep it there until the operator can close down the water wheel by hand or by power.

The induction alternators supplied by the

FIG. 5.—GEISSLER ELECTRO-MAGNETIC GOVERNOR.

Royal Electrical Company of Montreal may be seen in the background in illustration Fig. 1. It is considered by some engineers an entirely useless proceeding to install double current generators when rotary converters have been

brought to such a state of perfection as to supply the necessary direct current with so little inconvenience and expense. It will therefore be interesting to note any new additions which may be made from time to time to this class of apparatus in plants now in process of construction or under consideration.

The double current machine is undoubtedly used to good advantage when a direct current is necessary for low voltage lighting in the locality of the power station, and when alternating currents are required for supplying current to suburban points, while this method will also no doubt have many adherents where local street railway and suburban feeders must be supplied from a single station.

Z. T. GRAMME.*

BY SILVANUS P. THOMPSON.

By the death of M. Zénobe Théophile Gramme, the electrical world loses one of the pioneers to whom the vast developments of the past quarter of a century are largely due.

Born in Belgium, in 1828, he was brought up as a carpenter, but he early manifested a talent for machinery, which was developed by attendance at some scientific lectures at Liège.

It will be remembered how, following the scientific discoveries of Faraday, the production of electric light by the arc became gradually practicable. In England Staithe, and in France Foucault, devised mechanism for automatically regulating the carbon pencils. The primitive magneto electric generators of Nollet in France, and of Holmes in England, gave promise of success. Faraday himself lived to see Holmes' giant machine in the Great Exhibition of 1864, and reported that at last electric light might with safety be applied to lighthouses. In France the "Alliance" machine, constructed by able engineers on the basis of the older designs of Nollet, was also intended for lighthouse illumination. To Paris, and to the "Alliance" factory came Gramme as a simple fitter; with no technical training in electricity, he acquired a practical grasp of the properties of electric currents that led him to suggest valuable improvements. He worked also in the workshops of Rhumkorff where doubtless he gained an insight, not to be attained at that date in any other way, into the mysteries of making that perfect mechanical insulation so essential in the induction coil.

It was in the sixties, while Gramme was thus working his way upward in Paris, that other improvements were being made in generating machinery in other parts of the world. Pacinotti, then a mere student, now still professor, in the University of Pisa had made and described his magneto-electric machine having a toothed-ring armature. But Pacinotti's ring fell still-born, and his machine was relegated, unheeded though meritorious, to the shelves of the museum. In England, Wilde had broken new ground by showing how, from the minimum of current the most powerful currents could be mechanically generated, by using that minimum to exalt the magnetism of field-magnets of soft iron; and by this principle of multiplication he led up to the so-called self-exciting machines of 1866 and 1867. It is a bare matter of history that the name "dynamo-electric machine" was first applied to the

*From the "Electrician," London.

FIG. 4.—MONTMORENCY FALLS.

The power house shown in the illustration, Fig. 3, is 150 feet long and 40 feet wide. It is a stone structure and is equipped with five turbines in all, each having a capacity of 1,000 horse power, and each directly connected to a single generator. In addition to the double current machine above mentioned there are in operation four Stanley two phase alternators of the inductor type, generating currents of 5,000 volts, and having a frequency of 66 cycles per second. These machines have capacities of 600 kw. and 700 kw. The turbines are operated by water from the Montmorency Falls, shown in illustration Fig. 4; the total drop from the falls is about 275 feet before reaching the St. Lawrence River while the available head at the power house is about 200 feet.

The speed regulation of the turbines in this plant is secured by the use of Geissler water wheel governors, one type of which is noted in Fig. 5. The variation is said to be kept within ten revolutions under the heaviest changes of load, while ordinary variations of load do not affect the speed to exceed five revolutions. The mechanism used for turning the water wheel gate shaft consists of two worms and worm gears, a double ended flat friction plate and a set of epicyclic gearing. The worm gears are said to reduce the noise to a minimum while the face frictions are employed to start and

machine of Wilde, and then to the self-acting forms.

Wilde was himself assiduously developing various types for industrial purposes, when, in 1870, Gramme appeared upon the scene with the simple, uniformly-wound ring armature with which his name will ever be associated. His English patent has a curious history. It may appear strange that so important an invention should have been protected by so slight a specification—a few lines of description, a single claim, unaccompanied by any drawing; that constitutes the whole of the patent of Gramme and d'Ivernois. The simple fact is that at the date when the filing of the final specification became due Paris was besieged, and it was impossible to send drawings to the London agent, who simply filed the materials that were to hand. The rapid commercial success of Gramme's machine is due to a combination of causes. It was the first practical machine in which were combined the features of the continuity of commutation, the self-exciting arrangement, good lamination in the armature core, and reasonably good proportions in the magnetic circuit. No doubt, also, Gramme was fortunate in having behind him a good firm of mechanical engineers to undertake the construction of his machines. Be that as it may, there is no question that the "Machine Gramme, Type A" conquered the industrial world, and gave to its inventor a reputation which British engineers would be the last to belittle.

It is not, moreover, without significance that a good deal of Gramme's success is due to that which at the present day English manufacturers are too prone to decry—the publicity gained in international exhibitions. At Vienna in 1873, at Philadelphia in 1876, and notably at Paris in 1878 Gramme's machines were in evidence. It is said that the Gramme machines at Philadelphia incited the invention of the Brush and of the Thomson-Houston machines for arc lighting. It is certain that the Jablochkoff method of arc lighting, which was a feature of the Paris Exhibition of 1878, was largely made successful by the co-operation of Gramme in designing suitable generators to meet the new requirements. In the Electrical Exhibition at Paris in 1881 Gramme was again to the front with a most interesting series of varied designs, showing in how many directions he had worked at improvements. His ideas seemed to be instinctive. He could not calculate either the sizes of the parts or the numbers of windings. Precise rules were, as we all know, of later origin. But he had that eye for proportion that marks the intuitive engineer. It is related by M. Mascart how, in the Paris Exhibition of 1889, he walked through the machinery hall with M. Gramme to hear the old man's criticisms upon the different forms of dynamo. "There is too much iron," he would remark of one. "There is not enough iron," he would say of another. Before one machine he stopped in admiration, and then whispered: "C'est la perfection." It was the 320 hp. four-pole machine designed by Mr. C. E. L. Brown for the Oerlikon Company.

Gramme took for some years an active part in the industrial operations of the Société Gramme, which flourishes under the direction of M. Hippolyte Fontaine, but in recent years his connection had been little more than nominal. He lived quietly apart on his small property at Bois de Colombes, outside Paris. The writer remembers seeing the then iron-grey,

sturdy little man at the exhibition of 1881, but had never been able to meet him since.

In March, 1897, Gramme was made a knight commander of the Order of Leopold and on this occasion a banquet in his honor was given in Brussels. Two delegates from the Institution of Electrical Engineers—Prof. Ayrton and the present writer—were appointed to join in the celebration to convey the congratulations of their English brethren. The weather, however, was so stormy that cross-channel communication was stopped; and the English delegates had to content themselves with sending telegrams. It is satisfactory to know, however, that "Papa Gramme," as he was affectionately styled, had a splendid reception. A gold medal, recording the event, was struck to commemorate the signal services which Gramme had rendered to the electrical community, and this was presented by M. Mascart in an elegant speech.

Gramme also patented a form of battery, and designed several types of arc lamp. One of these had a breakwheel gear not unlike that of the later Brockie-Pell lamp.

Beside the Belgian decoration above-mentioned, Gramme was an officer of the Legion of Honor, and a chevalier of the Order of the Iron Crown of Austria. It is an open secret that his name had already been put forward at the council of the Institution of Electrical Engineers to be proposed for election as an honorary member. Alas, that is no longer possible. He died quietly at his home on January 20, in his 75th year, and was buried in the cemetery of Père Lachaise, Paris, on the 23rd inst.

THE ELECTRIC HEADLIGHT.

The Burlington & Missouri Railway in Nebraska is equipping its passenger locomotives with electric headlights, concerning the service of which T. E. Calvert, general superintendent, in an interview in the "Omaha Bee," remarks as follows:

The advantages of the electric headlight are numerous and I do not know any objection worthy of consideration that can be urged against it. One of the chief improvements is that enginemen can see switch targets and other obstructions on the track almost as easily as in daylight and far enough away to bring their train to a stop before getting into trouble. Another thing is that farmers and others on crossings will be warned by the bright light and fewer people will be run into by trains. On dark, foggy nights the reflection shows around curves and prevents head-end collisions. Electricity is so much better for headlighting purposes than acetylene that we have stopped experimenting with the latter altogether.

As an indication of the great brilliancy of the electric headlight, the first night an engine equipped with one for experimental purposes was on the road the agent at Grafton saw what appeared to be either a comet or a train. He knew that no train was due at that time and was considerably exercised. He telegraphed the dispatcher to know what train was coming in ahead of No. 3 and said it was even then in the east end of the Grafton yard. The dispatcher was himself perturbed until it dawned upon him that the new electric headlight was probably the solution of what seemed a serious problem. It turned out that the bright light which the Grafton agent saw was the electric headlight on No. 3, which was then in the Fairmont yards, seven miles away.

Another similar incident occurred on the first night. At Otis a freight train pulled into a siding to get out of the way of No. 3, when No. 3 was twenty miles away. The conductor saw the headlight bearing down upon him and there was some rapid hustling to get out of the way, the conductor thinking that the train was right on them. He waited twenty-six minutes for No. 3 to pass him after he had gotten safely in the clear, and No. 3 all this time was coming right along.

PAN-AMERICAN EXPOSITION-CITY TAKING ON BEAUTY.

BY ELBERT L. LEWIN.

Favorable weather, interrupted only occasionally by a bad day or two, has permitted of rapid progress of the work on the buildings and grounds of the Pan-American Exposition. All of the twenty or more larger buildings are now entirely enclosed. Some are practically completed and others are lacking only a comparatively little amount of work to bring them to a similar point. A few days more and the exteriors will be completely covered with staff and awaiting only the application of color and placing of sculpture to complete their external beauty. The wiring and placing of lamps for the electric illumination keeps pace with the structural work. Grading is in progress, walks are being laid, and ornamental work is being done in the courts, along the canals and on the terraces.

The work is so well advanced as to give visitors to the grounds a foretaste of what is to be when the Exposition gates are thrown open to the public on the first of May. The question, "Will it be ready?" which was frequently asked earlier in the progress of the work, is no longer heard. The appearance of things is an emphatic answer in the affirmative.

It is estimated that nearly a million people have visited the grounds since the beginning of the work of construction. On different Sundays more than 20,000 have passed through the gates.

About 3,000 men are employed in the building of the Exposition and there will be a large addition to the force early in the spring, when the necessities demand it.

Up to the present there has been used in the construction 26,570,000 feet of lumber and 6,242,000 pounds of steel and iron including bolts and washers. The amount of surface covered with staff is 17,765,000 square feet. The excavation has been for the fountains and sunken gardens, principally, approximately 150,000 cubic yards of earth having been removed.

In building the Exposition City the sum of \$10,000,000 is being expended. The Midway alone will cost \$3,000,000.

The Pan-American will not be as big as some former Expositions, but it will be more beautiful than any of them. The Exposition site is a commanding one, containing 350 acres adjoining Buffalo's lovely and expansive Delaware Park. In selecting the Spanish Renaissance style of architecture as a basis for the Exposition architects to work upon, the managers paid a compliment to the Latin-American countries, and at the same time provided for an effect of surpassing grandeur. The style has been somewhat modernized in its treatment, with the result of enhanced beauty. Color is judiciously applied to relieve the staff-covered structures of the blank monotony which has characterized former exposition cities. It is

rich, charming, restful to the eye—the very perfection of color decoration of buildings. The prismatic splendor has evoked the term "Rainbow City" for the ensemble of Exposition palaces. Sculpture will add to the attractiveness. Majestic statues and costly groups will adorn domes and towers and guard the entrances to buildings. There will be more than 125 groups of statuary in the Exposition City, the work of the best sculptors of the country under the direction of Karl Bitter.

The court settings will be superb. The principal courts are the Court of Fountains and Plaza which form a north and south perpendicular and connect with a transverse court called the Esplanade. In all the courts will be large pools rippling and sparkling under the fantastic activity of numberless fountains. Many of these fountains are to be elaborate sculptured works with jets of water playing from hundreds of openings.

Surrounding the main group of buildings and bordered with a double row of trees and grassy banks, is a broad and stately canal more than a mile in length.

In perfect harmony with the grandeur and beauty of the buildings and courts will be the horticultural and floral embellishments of the grounds.

Rising high above all the other structures on the Exposition grounds the Electric Tower is the first object to arrest the attention of visitors. It is 391 feet high. The base is 80 feet square to a height of 200 feet. This base is flanked on the east and west sides by colonnades, 75 feet in height, semi-circular in form, which curve toward the south, forming a clasp setting for the great basin of the Electrical Fountains. From the fountains of the Goddess of Light at the apex, the Tower will be one mass of quiet beauty by day and of fiery, sparkling grandeur by night. Elevators will take visitors to the restaurants upon the colonnade, where they will have a commanding view of the broad and beautiful Court of Fountains.

The electrical display will be far superior to any yet attempted.

These are the principal features which will excel all former attempts of the kind and serve to make the Pan-American Exposition City the most beautiful spectacle ever prepared by the genius of man for a similar enterprise. It will be a picture that will delight and satisfy, and linger long in the memory.

The Pan-American Exposition concerns itself with the progress of the countries of the Western Hemisphere and the new possessions of the United States. To show the achievements during the century just closed and make far more rapid progress in the future is the chief purpose. In order to realize the ideal in mind the various countries, commercially and socially. The golden opportunity comes with this Exposition, when the representative men of all the countries in question will be gathered together and the diversified resources of the Continent displayed. Such an international congress of people, exhibits and ideas, must needs develop much of good for the inhabitants of the Continent and posterity. It offers the chance for better acquaintance, the acquirement of new and useful knowledge, a comprehension of each others' opportunities and necessities, the settlement of questions which have too long retarded international trade in Pan-America, and the laying of a strong and enduring foundation for an intercourse which will be mutually beneficial.

The Pan-American Exposition has the cordial endorsement of the United States Government, which has appropriated \$500,000 for an exhibit.

The Government is erecting three handsome buildings for its exhibit. The main building is 130 feet wide and 600 feet long. The others are each 150 feet square. The architecture is a free treatment of the Spanish Renaissance, the details suggesting a Mexican rather than a strictly Spanish origin. Like the other Exposition buildings, they are being covered with staff and tinted and gilded, giving the intricate plastic decorations and sculptor groups an ensemble both striking and interesting. Red Spanish tiles on the roof add to the beauty.

The space for the Government exhibits is but little less than was used at the Chicago Exhibition. Of particular interest will be the Government's big gun exhibit—a group of three immense pieces of ordnance being mounted immediately at the north of the main Government building. One of these is the 12 inch gun with disappearing carriage, so arranged that neither the gun nor gunner is exposed during the moment of firing, the recoil causing their disappearance. Another is the 16 inch sea-coast half-mast rifle, the most powerful piece of ordnance ever constructed in the United States, having a maximum range of 20½ miles.

The States of the Union, the Dominion of Canada, Central and South American countries and the Islands of the West Indies will be represented officially and by individual exhibitors. New York State's appropriation for an exhibit is \$300,000. Its building will be permanent. It is constructed of white marble, and the style of architecture is that of a Doric Temple.

The amusement feature is far superior to any former one in connection with an exposition. The Midway attractions are the pick of hundreds offered.

There are more than 40,000,000 people living within a night's ride of the Pan-American Exposition, and a great attendance, possibly exceeding that at the Columbian Exposition, is confidently expected. The hopes of the managers are for more than 25,000,000 paid admissions.

Submarine and Submersible Boats.

In the "Moniteur de la Flotte," M. Rousseau devotes an article to submarine and submersible boats in relation to the recent trials at Cherbourg. He says that the trials did not throw any new light upon these engines of war, but that they had the merit of bringing the two types of boats into direct comparison, and that the opinion of officers who had been in command of them was unanimous. They all indicated their preference for the submarine boat properly so-called, having evidently some distrust of the submersible. M. Rousseau, however, points out that the Morse represents a type of boat more or less established, and that the submersible Narval is of a new class altogether. He remarks that the trials must not be interrupted of a type of boat which will have the advantage of being offensive. He has been on board the Morse, and says that she navigates with perfect ease below water, that those in her are able to discern by means of the periscope what is going on upon the surface, and that torpedoes are discharged with an accuracy and certainty which might be the envy of officers of ordinary torpedo boats. It appears that the periscope can be employed up to a depth of

about 20 feet below the surface, and, according to M. Rousseau, it is quite adequate to prevent collisions, and being turned round, enables those below to scan the whole horizon.

It has been suggested that the instrument would be valueless except in smooth water, but the writer cited asserts that during the Cherbourg experiments the sea was very rough and that the appliance gave, nevertheless, a very clear view. At a greater depth than 20 ft. the course of the Morse is directed by the compass. The plunge is effected by suppressing her flotability by admitting water into special chambers, and there is equilibrium so that the descent is made in the horizontal position, and the required level is maintained by lateral wings or rudders, to the movement of which the boat is very sensitive. The class of boat thus described is available purely for local defences, but the Narval, the system of which is described by M. Rousseau, could be employed in offensive operations. He says that the advantages of the submersible system would be incontestable, but that certain problems have arisen of which the solution has not yet been altogether realized. Larger water chambers and more powerful pumps are required for the plunging and raising of the boat. The steam not used during the surface navigation must be condensed.

These difficulties, combined with the necessity of coupling the electric mechanism with the driving apparatus, make it impossible to plunge the boat within less than 17 or 18 minutes. The period will be reduced to 10 minutes in the Silure, Triton, Sirene, and Espadon, but it will still be too long, and in an actual encounter would leave the boat helpless before her adversary. The belief of M. Rousseau, however, is that the type of the submersible is perfectible, and that the difficulties will be overcome.—"Engineering," London.

The Universality of Electrical Generation.

One of the lessons to be learned from the various methods for generating electricity, and the constant manner in which it persists in putting in an appearance, is the fact, so often overlooked, of its almost universal generation. There is hardly an operation which takes place, in the process of which electricity is not generated in some form or other. A belt running over a pulley—say, driving a dynamo or any other machine—generates electricity as well as heat and sound. In dry and dusty factories, as is well known, sparks of considerable magnitude may often be taken either from the pulley or the belt. All this reduces the efficiency of the transmission, or distribution plant. Every flap of the belt, every unit of electricity, every unit of heat, and every unit of sound generated by a moving belt has to be provided by the driving apparatus, over and above the energy required to drive the machine it is turning, whatever that may be; therefore everything that can be done to reduce these generations, these losses as they are with reference to the work in hand, increases the efficiency of the plant and reduces the coal bill and other working costs.—"Colliery Guardian," London.

Mr. R. L. O'Neill, who has traveled much in Mexico, states that there is a rapidly growing demand in that country for electrical machinery, electrical supplies and electrical mining implements manufactured in the United States.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The invasion of the horseless vehicle is spreading in Canada. The recently organized Electric Cab Company of Toronto will have cabs and tourist brakes on the streets of Toronto as soon as they can be turned out of the factory. The company now proposes to extend its business to Ottawa and other large Canadian cities. At a meeting of the stockholders, a few days ago, it was decided to double the capital of the company and go into wider fields of operation.

Another large electric company is being formed at Ottawa, provided a charter can be obtained from the city council. Mr. J. W. McRae, late managing director of the Ottawa Electric Company, is the chief promoter of the scheme. The new company is to be called the Consumers' Electric Company, and by its charter will have the power to carry on its business in Ottawa and elsewhere, for the purpose of producing and supplying electric current for electric light, heat and power.

At the next session of the Quebec Legislature a number of Montreal citizens will make application to establish an electric plant near Riviere des Prairies, in Quebec Province. A survey has already been made, and the new company proposes to supply electric energy for heat, light and power purposes to towns within its sphere of operations.

It is announced that by July 1, 1903, the city of Toronto will be fully supplied with electric power generated at Niagara Falls. The Canadian Niagara Car Company, it is stated, will at once begin work on the production of the power. No prior arrangements have been made for the sale of the power in Toronto, and the city authorities will therefore probably be given the first option of handling it. The company has not yet decided whether a line across the country or a cable across Lake Ontario will be used to transmit the energy. This company is the Canadian branch of the big concern that has developed 50,000 horse power on the American side of the falls, and is now adding 30,000 horse power more.

Iowa Electrical Association.

The annual meeting of the Iowa Electrical Association will be held in the club rooms of the Savery Hotel in Des Moines, February 20 and 21, beginning at 10 o'clock A.M. A most interesting meeting is anticipated. Papers have been prepared and will be read upon the following subjects: "An Analysis of the Cost of Supplying Electric Current and the Various Systems of Rates," "The Regulation and Control of Wiring," "Central Station Heating—Mechanically and Financially," "The Renewal of Incandescent Lamps," "The Gasoline Lamp," "Experiences with Mechanical Draft," "Pounds of Coal Required to Produce One Kilowatt Hour," "How Can Delinquent Bills Be Prevented Without a Net Loss of Business," "The Massachusetts Laws." The officers are: President, W. J. Greene, Cedar Rapids; vice-president, H. H. Caughlan, Ottumwa; treasurer, George S. Carson, Iowa City; secretary, W. B. Keffer, Des Moines; executive committee: W. J. Greene, H. H. Caughlan, W. B. Keffer, W. S. Porter and A. Edgecomb.

U. S. Engineer Office, 537 Congress St.
Portland, Me., Feb. 6, 1901.

SEALED PROPOSALS for furnishing and delivering apparatus for electric light plant for Fort Williams, Me., will be received here until 12 M., March 11, 1901, and then publicly opened. Information furnished on application.
S. W. ROESSLER, Maj. Engrs.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended February 6:

Antwerp, 16 cases, \$2,782; 20 packages, \$733; Amsterdam, 1 box, \$15; Argentine Republic, 18 packages auto vehicle parts, \$1,800; 18 packages, \$350; Brazil, 3 packages electric railroad material, \$595; 60 packages, \$5,359; Bremen, 5 cases, \$840; British West Indies, 18 cases, \$227; 1 motor vehicle, \$900; British East Indies, 8 cases, \$442; Brussels, 1 package, \$49; Central America, 136 packages, \$2,379; Chili, 39 packages, \$1,758; Cuba, 211 cases, \$5,048; Dutch East Indies, 19 cases, \$279; Dutch Guiana, 2 cases, \$25; Dutch West Indies, 2 packages, \$25; Ecuador, 1 case, \$23; Genoa, 101 packages, \$12,430; Glasgow, 99 packages, \$34,352; Halifax, 1 case, \$18; Hamburg, 77 packages, \$2,761; Havre, 10 packages, \$985; Hayti, 4 packages, \$158; Hull, 34 cases, \$5,828; Liverpool, 434 cases, \$19,940; 149 packages, \$28,969; London, \$118 packages, \$13,885; 1 case motor vehicles, \$880; Manchester, 66 packages motor trucks, \$3,200; Mexico, 1,147 cases, \$15,547; 35 packages, \$14,950; 3 packages auto vehicles, \$2,000; Milan, 1 case, \$28; Newcastle, 105 cases, \$4,871; Newfoundland, 1 package, \$66; Nova Scotia, 18 packages, \$586; Palermo, 1 case, \$7; Peru, 45 packages, \$658; Ramsgate, 26 packages, \$4,000; Riga, 2 cases, \$306; Rotterdam, 6 cases, \$60; Southampton, 4 packages, \$213; U. S. Colombia, 16 cases, \$289; Venezuela, 55 packages, \$818.

PERSONAL MENTION.

Mr. Julian DuBois, former road master of the Union Railroad of Troy, N. Y., has been appointed to the position of superintendent of the Street Railway and Electric Light and Power Company of Amsterdam, N. Y.

Mr. Frederick E. Judson, of Nashville, Tenn., has been appointed manager of the Knoxville, Tenn., exchange of the Cumberland Telephone Company.

Mr. Hugh J. Collins has been appointed assistant treasurer of the United Traction Company of Albany, N. Y., in place of Joseph G. House who resigned.

Mr. Robert Pond Brown, formerly chief engineer in charge of the electrical equipment of the Brooklyn Heights Railroad Company, died on February 8.

Mr. C. K. Mead, former manager for the Fort Wayne Electric plant, is a candidate for appointment as city electrical inspector of Des Moines, Ia.

INCORPORATIONS.

The Elkhart Electric Company, Elkhart, Ind. Capital stock, \$100,000.

The Electric Railway Equipment Company, Philadelphia, Pa. Capital stock, \$35,000.

The Homer Electric Light & Power Company, Homer, Mich. Capital stock, \$14,000.

The Franklin Electric Company, Davenport, Ia. Capital stock, \$50,000. Incorporators: William H. Cercilius, John Austin and H. M. Howley.

The National Electric Security Company, Peoria, Ill. Capital stock, \$30,000. Incorporators: John H. Bontges, William Donaldson and C. E. Unland.

The Mercantile Electric Company, St. Louis, Mo. Capital stock, \$100,000. Incorporators: Gerard Swope, Isaac Schwab, David Goldsmith, Charles G. Dubois, James W. Johnston and Fred B. Uhrig.

The Leonard & Hall Company, Wallingford, Conn.—to deal in plumbing, steam fitting and electrical supplies. Capital stock, \$2,000. Incorporators: P. J. Leonard, James E. Hall, Rose M. Hall and Nellie F. Leonard.

The Chairman Mining & Electric Company, Denver, Col. Capital stock, \$1,000,000. Incorporators: Lorenzo R. Johnson, M. B. Dunham, Fred Morck, Dix W. Smith, Milan Hibbard, Theron P. Otis, Edward Campbell, B. S. Cushman and J. I. Stanton.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 5, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

667,246. Electromagnetic Brake-Shoe. Frank C. Newell, Wilkingsburg, Pa., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa. Filed April 28, 1900.

667,336. Trolley Head. Eli S. Reed, Hill City, Tenn., assignor of one hundred and fifty-three two-hundredths to Edward M. Smith and William P. McClatchey, Chattanooga, Tenn. Filed June 20, 1900.

667,509. Current-Collector for Electric Railways. Frederick C. Esmond, New York, and Norton P. Otis, Yonkers, N. Y. Filed Nov. 17, 1899.

667,571. Trolley-Wire Crossing. James W. Perry, Philadelphia, Pa. Filed May 10, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

667,324. Shade-Holder for Electric Lamps. George M. Lane, Newark, N. J., assignor to M. Samuel Kamm, same place. Filed Sept. 17, 1900.

667,372. Electric-Arc Lamp. Hans O. Swoboda, New York City. Filed June 15, 1900.

667,584. Electric-Arc Lamp. Rupert Scheffbauer, Jersey City, N. J., assignor to the Sterling Arc Lamp Company of New York. Filed May 1, 1900.

667,585. Electric-Arc Lamp. Albert Schweitzer, Pittsburg, Pa. Filed Oct. 6, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

667,375. Electric Motor. George E. Weisenburger, Sharon, Pa., assignor of one third to E. W. Beadel, New Castle, Pa. Filed Feb. 21, 1900.

667,519. Electric Meter. Jesse Harris, Rensselaer, N. Y. Filed June 2, 1900.

667,619. Controller for Electric Motors. Thomas W. Eaton, Chicago, Ill., assignor to the Eaton & Prince Company, same place. Filed Oct. 8, 1900.

667,625. Automatic Electric Circuit-Breaker. Bertram Hopkinson and Ernest Talbot, London, Eng. Filed July 16, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

667,195. Telephone-Switchboard Connection. Thomas V. Davis, Chicago, Ill. Filed April 28, 1900.

667,327. Telephone-Transmitter. Tidolf Lidberg, Chicago, Ill., assignor to the Swedish-American Telephone Company, same place. Filed Oct. 3, 1900.

667,448. Signal for Trunk-Lines. Frank R. McBerty, Downer's Grove, and James L. McQuarrie, Chicago, Ill., assignors to the Western Electric Company, Chicago, Ill. Filed Jan. 11, 1897.

667,460. Telephone-Exchange Apparatus. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Sept. 25, 1896.

667,461. Apparatus for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Jan. 9, 1897.

667,462. Signal-Lamp for Telephone Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed March 9, 1898.

667,463. Signaling Apparatus for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 7, 1899.

667,484. Device for Disinfecting Transmitters and Receivers of Telephones. Cyrus F. Axtell, New York City. Filed May 25, 1900.

667,503. Phonograph Attachment for Telephone-Circuits. Allan B. Clark, Nashville, Tenn., assignor of one half to J. Roy Boone, same place. Filed July 10, 1900.

667,546. Telephonic Transmitter. Lemuel Mellett, Somerville, Mass., assignor to Albert F. Henderson, Melrose, Mass. Filed June 14, 1900.

MISCELLANEOUS.

667,366. Lightning-Rod. Ebbe J. Hansen, Atlantic, Iowa. Filed May 22, 1900.

667,374. Electric Heater for Liquids. Joseph A. G. Trudeau, Ottawa, Can. Filed April 4, 1900.

667,421. Means for Connecting Electrodes. Henry Blackman, New York City. Filed June 6, 1899.

667,434. Signaling System. Waldo F. Follett, New Haven, Conn., assignor to the National Electrical Manufacturing Company, Milford, Conn. Filed June 22, 1900.

667,435. Cartridge Fired by Electricity. William Friese-Greene and Percy E. Knell, London, Eng. Filed Dec. 30, 1899.

667,454. Fac-Simile Telegraph. Anton Pollak, Szentes, Austria-Hungary. Filed Feb. 17, 1899.

667,498. Electrolyzer. William T. Chapman, Manchester, Eng., assignor to the American Alkali Company, Philadelphia, Pa. Filed Sept. 12, 1900.

667,567. Conduit for Electric Wires. Emmett D. Page, New York City. Filed May 14, 1900.

DESIGN.

34,040. Incandescent Electric Lamp. Charles A. Chase, Chicago, Ill., assignor to the General Incandescent Lamp Company, Cleveland, O. Filed Jan. 11, 1901. Term of patent 14 years.

THE TELEPHONE WORLD.

Keystone Company to Start Soon.

In Philadelphia, Pa., it was recently stated semi-officially that the work of construction on the Keystone Telephone Company's system would be commenced within three or four weeks and pushed from then on until the company was ready to enter into active competition for business in the local telephone field.

The statement came from C. E. Wilson, general manager of the Keystone. Among other things Mr. Wilson said that a number of expert workmen had been already engaged, and that others were being arranged for. These will be put to work not later than March 1, or earlier if the weather will permit. The plans for the conduits and other important parts of the system have been practically all completed, a force of engineers and draughtsmen having been engaged on them for several months. No contracts for the work of construction had been awarded February 5, but contractors will be asked to submit bids within the next few days.

It is understood that the conduits laid by the Standard Telephone Company and by at least one of the other telephone companies, whose franchises the councils ordered forfeited several months ago, have come into possession of the Keystone, and that they will be utilized in the latter company's system. The matter of rates has not been decided upon by the Keystone's officials, or if it has nothing concerning the prices to be charged patrons of the new company has been permitted to leak out. The Keystone expects to start business with at least 10,000 subscribers.

Alexander Balfour is president of the new company and Congressman Robert H. Foederer a member of the board of directors.

The People's Telephone Company of Clinton, Tenn., is preparing to make some important extensions in the spring, which will reach Harriman, LaFollette, Jellico and intervening points. It will be a three circuit system, or six wires, the purpose being to make it a system first-class in every respect. These extensions will add many miles to the system, as well as some valuable toll stations, and probably some excellent local exchanges.

A meeting was held recently to arrange plans for organizing a local independent telephone company in Hooper, Neb. E. O. Spielberg was elected chairman and J. Howard Heine secretary. A committee was appointed to estimate the cost of the system and report at the next meeting, when articles of incorporation will be made. There have been forty telephones subscribed for and it is the intention of the company to extend lines into the country.

The United Telephone Company, which owns a system of telephone toll lines in Northern Indiana, has purchased the line built along the Cudahy oil pipe line from Bluffton to Kankakee, Ill., through Wabash County. When the Cudahy oil line was sold to the Standard the telephone line became useless to the oil people. It will form a valuable link in the long-distance line to Chicago.

There are within the limits of what the company defines as the Worcester, Mass., Telephone Exchange, which includes many suburban towns, a total of 3,700 subscribers in round numbers. The number of exchanges or central offices in those limits is nine, including Whitinsville, Millville, Princeton, Oxford, Uxbridge, North Oxford, Barre and Jefferson. To connect the many places within the exchange limit 6,000 miles of wire are in use.

Articles have been filed for record changing the name of the Keokuk, Ia., Telephone Company to the Mississippi Valley Telephone Company and increasing the capital stock from \$75,000 to \$100,000.

The Telephone Manufacturing Company of Sumter, S. C., recently shipped a car load of the "Imperial" phones to Havana, Cuba, where the company has established an agency to supply the Cuban and West Indian trade.

The Waseca, Minn., Telephone Company recently reported gross earnings to the State Auditor amounting to \$2,113 for 1900. The company will pay the State a tax of \$63.44.

The O'Fallon, Ill., Telephone Company, composed of local capitalists, has begun the erection of poles preparatory to putting in a local telephone system, for which a franchise was recently granted by the town board.

The managers of the Wisconsin Telephone Company and the Kenosha city officials met a short time ago to settle the telephone war in that city. The company will place its wires in cables in the business streets of the city.

Telephone Improvements in Nova Scotia.

The Nova Scotia Telephone Company of Halifax has completed the work of putting a large number of its wires underground. The wires are all encased in heavy cables, and are well protected from the weather. The company has already expended about \$25,000 for trenching, cable, the laying of the latter, and other underground work. It will probably be a month before all wires are connected and in working order. As soon as this work is completed new up-to-date switchboards will be installed in the central office, and thereby the whole telephone system throughout the city will be simplified and improved.

Manager Harris hopes that in the course of two months all the improvements will be completed, and then the service will be equal to that found anywhere.

In speaking of the independent telephone situation, Judge J. M. Thomas of Cleveland, O., president of the Independent Telephone Association of the United States, lately said the movement was never in a better condition. He openly declared that the recent sale of the Erie Telephone & Telegraph Company to the Bell interests was an incalculable benefit to the independent companies, and explained that its control by the large national independent company was a menace and a drawback to the harmonious relations of the Telephone, Telegraph & Cable Company of America with the numerous telephone systems throughout the country, which are now being operated in opposition to the American Bell.

The new independent telephone system in Greeley, Col., is now in full operation and an unqualified success. The company has opened up a handsome office. Two hundred phones have already been placed in Greeley, forty at Evans and ten at La Salle. The company is contemplating extending its lines to other towns in that section. The Stromberg-Carlson central energy system is employed. The company has named an extremely low rate for its service. For residences, full metallic circuit, only \$1 per month will be charged. The rates to business concerns will be \$2 per month.

Jeffries Wyman, of Boston, a director of the Central New York Telegraph & Telephone Company, a part of the Bell system, was in Watertown, N. Y., last week for the purpose, it is said, of making overtures to the Citizens' Telephone Company to purchase the latter system, which extends throughout Northern and Central New York. An official of the latter company says his company will not sell out. The telephone war in that section is being waged in earnest.

The Toledo, O., Telephone, Telegraph & Messenger Company, which was organized last month announces that it will apply for a franchise at an early day and that the ordinance will be published before being put in the legislative hopper. The officers of the company are: J. H. Bellows president, C. F. Watts vice-president and counsellor, H. A. Merrell secretary, and A. M. Hough treasurer.

A telephone company has lately been chartered in Fayetteville, W. Va., with a capital of \$50,000, to build a complete telephone system over Fayette County, and connect with other long-distance lines. Work will commence immediately.

The Knickerbocker Telegraph & Telephone Company has engaged the top floor of the Rothschild building, at the corner of Fulton and Jay streets, Brooklyn, N. Y., which will ultimately be "Central," together with office space for the executive department. Robert Mason is in charge of the new offices.

A meeting of the stockholders of the eight rural telephone lines centering in Munith, Mich., was recently held for the purpose of establishing a uniform rate for switching. It was decided to hire W. H. Suyland and pay him at the rate of five cents per switch. The total number of phones on the eight lines is 175.

A telephone line is being built in Oregon by the Sunset Company from Jacksonville to the Upper Applegate country, and will probably be connected with the Grant's Pass Williams line.

The Western Union Telephone Company of Chicago has decreased its capital stock from \$100,000 to \$35,000 and number of directors from five to three.

Henry M. Fitch says he will extend the Highland Telephone line to Monroe, N. Y., as soon as the frost is out of the ground.

The whole system of the Maryland Telephone Company (Home) has been overhauled and improved by electrical experts in Hagerstown.

The growth of the Clinton Telephone Company the past year has been remarkable. There are 378 phones in Wilmington, O., and 572 in that company's county system. Every part of Clinton County is now connected, with exchanges at Wilmington and Sabina, and toll stations at Blanchester, Cuba, Clarksville, Bloomington, North Kingman, South Kingman, Lee's Creek, Lynchburg, Martinsville, Melvin, Midland, Memphis, Morrisville, New Antioch, New Vienna, New Burlington, Oakland, Port William, Reesville and Sligo. The Clinton Company has long-distance connection with nearly one thousand cities and towns in Ohio over the lines of the United States Telephone Company.

One hundred farmers near Keota, Ia., have planned to build a telephone line early next spring, which will not be equalled by many in the State. The line proper will be nine miles long, and will connect Keota and South English, at both of which points it will join the long-distance switchboards. In Lafayette and Liberty townships the farmers will be joined to the line by a perfect network of wires and will have all the advantages of living in a city with long-distance connections.

The Southern Illinois Independent Telephone Association met in Pickneyville, Ill., a short time ago, and made arrangements with the Kinloch Telephone Company for connections with the latter's long-distance lines to St. Louis, Mo. It is the purpose of the Kinloch people to extend their long distance lines to Duquoin, Ill., and there connect with the independent lines of Southern Illinois.

The St. Petersburg, Fla., Telephone Company, is making arrangements to put in a long-distance line to Tampa. The people of Tarpon Springs, Fla., have formed a co-operative company to put in a telephone system in their town, and expect to make arrangements to connect with the Tampa St. Petersburg line.

The board of public works of Newburgh, N. Y., has granted a franchise to the recently incorporated Colonial Telephone Company. The company is limited to a charge of \$36 a year for instruments in business places and \$24 a year in residences. Seven telephones are to be furnished free for use by the city.

At a recent meeting of the Ripley, O., town council a franchise was granted to the independent telephone company to erect poles and operate a telephone line in Ripley. Representatives of the company were present from Batavia and Delaware, O. Ripley already has the Central Union Telephone Company.

The town council at Worthington, O., has voted unanimously to grant a franchise to the Citizens' Telephone Company to put in an exchange there. It will be put in at once, operating not only to Columbus but to the district all around Worthington.

The new Citizens' Telephone Company of Terre Haute, Ind., probably will institute an interurban system by placing telephones in the homes of farmers in that section. In the smaller towns where there will be no exchange a toll box will be placed in a convenient locality.

A telephone war now rages in Orangeburg, S. C. An independent line seeks to enter and is favored by citizens because the older company, a Bell concern, has not complied with the conditions.

The local telephone exchange at Westerville, O., is about complete. There are nearly fifty phones in operation, and the rest of them will be connected shortly.

The new telephone line from Rockland to Norwell and Greenbush, Mass., is now completed and the different stations along the line connected.

TELEPHONE INCORPORATIONS.

The Chicago Telephone Supply Company, Chicago, Ill. Capital stock, \$25,000. Incorporators: George A. Briggs, Henry L. Briggs and Blanche W. Briggs.

The Alaska Townsite & Telephone Company, New York City—to manage telephones and telegraphs, and hold real estate. Capital stock, \$1,000,000.

The Hutchinson Telephone Exchange Company, St. Paul, Minn. Capital stock, \$25,000. Incorporators: M. W. Clay, W. S. Clay, W. W. Sivright, E. J. Stearns, W. E. Harrington, William Davidson and C. G. Odquist.

The Woonsocket Telephone Company, Woonsocket, S. D. Capital stock, \$2,500. Incorporators: E. M. Smith, S. A. Ramsey, J. C. Whiting and C. V. Templeton.

GENERAL ELECTRICAL NEWS.

Lighting.

Brownsville, Tenn.—The electric light plant at this place was recently destroyed by fire. The loss is estimated at \$8,000.

Chicago, Ill.—The city council has recommended the proposed bill for the municipal ownership of gas and electric plants.

Davenport, Ia.—The People's Light Company of this city has developed plans for the erection of a new electrical station in this city, at a cost of \$100,000, for the general supplying of light and power here.

Dickson, Tenn.—The voters are petitioning the Legislature to authorize a bond issue for the purpose of installing an electric light plant.

Haddonfield, N. J.—A new electric light company is being organized here to be known as the Consumers' Electric Light Company, to compete with the South Jersey Gas, Electric & Traction Company. The capital stock is placed at \$10,000.

Hawkinsville, Ga.—This place is to have electric lights in the near future.

Livingston, Mont.—Joseph Kountz and Samuel Mendenhall, proprietors of the Bozeman Electric Works, met with the city council and outlined a plan for an electric plant for this city. The matter of a franchise will be taken up at once and if no unforeseen delay occurs the plant will be ready by May 1.

Lumberton, N. C.—A special election will be held March 1 for the purpose of issuing bonds to build an electric light plant.

Madison, Wis.—The assembly recently discussed the plan for a State electric lighting plant to light the capitol and other State buildings, and a resolution was adopted calling upon the dean of the engineering college for an estimate of the cost of such a plant.

McIntosh, Minn.—The citizens are agitating the question of erecting an electric light plant.

Menasha, Wis.—The citizens of this place are agitating the question of erecting an electric light plant.

Napoleonville, La.—This city is about to vote on levying a tax for constructing an electric light plant.

Newport News, Va.—It is reported that the old electric light company has cut its lighting rates to 66¢, cents in anticipation of a fight with the new company.

Obion, Tenn.—This town contemplates the issuance of bonds for the purpose of erecting an electric light plant.

Provincetown, Mass.—Efforts are being made by out-of-town parties to establish an electric lighting plant here.

Riverside, Cal.—C. G. Baldwin has made a proposition to the board of trustees to supply this place with electricity.

San Juan, Porto Rico.—An electrician lately sailed from New York City to install a complete electric light plant on the plantation known as the Canovanas Sugar Factory, Limited, at Canovanas. There will be 600 sixteen candle power and twenty-five enclosed arc lamps.

Vincennes, Ind.—Edgar J. Julian has been appointed receiver for the recently established plant of the city electric lighting company of this place.

Warren, O.—The Warren Electric Light & Power Company is preparing to replace the 100 kw. Wood alternator with a 200 kw. alternator, giving the plant double its present capacity.

Xenia, Ill.—A company of local capitalists is arranging for the erection of an electric light plant here.

Street Railways.

Asbury Park, N. J.—There is every indication that by the middle of summer a continuous trolley road will run from Atlantic Highlands through Red Bank to Long Branch, to connect with the Asbury Park line.

Belvidere, Ill.—The Belvidere city council has granted the franchise asked for by the Rockford-Belvidere Electric Road.

Birmingham, Ala.—Robert Jamison, vice-president of the Birmingham Railway, Light & Power Company, states that the company will spend about \$500,000 in extending and improving the system. The line be-

tween here and Bessemer, 12 miles in length, is to be rebuilt entirely, 60-pound rails put down, and the line now operated by steam will be converted into an electric line, also the line between Powderly and Bessemer. This line is 7 miles long. A number of electric cars will be added to the equipment.

Brighton, Mich.—The village council has granted a franchise for thirty years to G. H. Winteres and associates to build an electric line through this village from Detroit to Lansing.

Canisteo, N. Y.—The question of building an electric railroad between here and Jasper is again being talked of.

Durham, N. C.—The Chapel Hill board of aldermen have granted the right of way for a trolley line from here to Chapel Hill. It is to be built by Northern capitalists.

East Liverpool, O.—Hait & Smith of Cleveland have secured a permit from the Columbiana County commissioners to build an electric railway line from Salem to this place passing through Lisbon. It will cover 28 miles.

Fort Edward, N. Y.—A proposed trolley line between here, Granville and West Pawlet, Vt., is being discussed and it is said meets with unanimous approval by the residents of the three villages.

Gainesville, Ga.—An electric car line for this place is now only a question of time. Men of means have the scheme in view.

Muncie, Ind.—E. T. Ice, of this city, is making arrangements to build an electric railway between here and New Castle.

New Rochelle, N. Y.—President Maher, of the Union Railway Company has been here lately arranging for a number of improvements which are to be made in the spring. Eventually the line will be continued to the county seat at White Plains. Another extension is to be built to a new pier at Neptune Bay. This will provide the trolley company with a steamboat landing and a place for unloading freight.

Ottawa, O.—Ottawa is trying to interest capital in building an electric line that will connect this city with Delphos, Defiance, Findlay and Lima.

Owosso, Mich.—At a special meeting of the council of Vernon a 30-year franchise was granted to Messrs. Bensen & Hadsall of this place for an electric road from here to Durand.

Painesville, O.—H. A. Everett has lately been granted a franchise for an electric railway from here to Fairport.

Poquonock, Conn.—A party of surveyors was recently at work between here and Noank in connection with the proposed new trolley road.

Readville, Mass.—Directors of the New York, New Haven & Hartford Railroad are now considering the proposition for the installation of a suburban electric service into the south terminal station. It has been decided that the power station of the suburban electric service will be located here.

Sheffield, Mass.—The Berkshire Street Railway Company has perfected its organization, its object being the building of an electric railway line from Maple Grove to this place. The road will be about 55 miles long, and will join the Hoosac Valley Railway at North Adams, connecting both ends of Berkshire County. The capitalization of the company is \$1,100,000.

Spencer, Ia.—Local men of means are trying to interest Eastern capitalists in a proposed electric line from Rossie to this place, and from here to Lake Okoboji and Spirit Lake.

Troy, O.—The New Carlisle, Troy & Springfield Electric Railroad Company was recently incorporated. The road is to be finished to this place by March 1, 1902.

West Chester, Pa.—A company is being formed for the purpose of building a trolley road from here to Downingtown, thence to Coatesville and Parkesburg.

Manufacturing.

Buffalo, N. Y.—The Adams Construction Company of this city has been formed to manufacture electrical equipments with a capital of \$5,000. H. S. Wasson,

J. O. Munroe and W. J. Jamison hold an interest in the concern.

Chicago, Ill.—The American Rail Bond Company capitalized at \$10,000, will manufacture rail bonds and electrical apparatus. The interested parties are M. M. Wood, George W. Conover and Wells Goodhue.

Laconia, N. H.—The Lakeport Manufacturing Company was recently incorporated here with a capital of \$6,000 for the manufacture of motor vehicles, engines, etc.

Syracuse, N. Y.—The Crouse-Hinds Electric Company of this city recently manufactured and shipped to the Wilson Aluminum Company of New York a switchboard which with all its equipment weighed sixteen tons. The contract price was upwards of \$10,000.

Troy, O.—This place may soon have an incandescent electric and arc light factory.

Company Matters.

Milwaukee, Wis.—The Milwaukee Electric Company has increased its capital stock from \$40,000 to \$150,000.

Philadelphia, Pa.—The annual meeting of the Pennsylvania Manufacturing, Light, Heat & Power Company for the year ending December 31 was held last week. The following directors were elected: Joseph B. McCall, Jeremiah J. Sullivan, William P. Conover, Jr., A. V. R. Coe and J. Marton Fultz.

Reading, Pa.—The Electrical Equipment Company of which William D. Jones is manager, is about to commence business and will carry an extensive line of electrical supplies and apparatus. It will also make a specialty in installing the same.

Wilmington, Del.—J. E. Rhoads & Sons have been awarded the contract for the dynamo belts for the Brandywine Springs Railway Company.

Power and Transmission.

Knoxville, Tenn.—It is stated that the Knoxville Power Company is planning to harness the power of the Tennessee River, which will enable it to furnish power at a minimum cost. Tully R. Cornick is counsel for the company, which is capitalized at \$800,000.

Occoquan, Va.—The mill property situated here has, it is understood been purchased by a Washington electrical concern for \$25,000. The purchasers, it is said, will utilize the water power at the falls for generating electricity, which will be conveyed by wire from this place to Washington.

Automobiles.

Cleveland, O.—Cleveland men, formerly conspicuous in the manufacture of bicycle parts and accessories, have organized the Automobile and Cycle Parts Company, with an authorized capital stock of \$5,000,000, and have purchased eight properties from the American Bicycle Company. Among those interested in the concern are: A. L. Garford, J. D. Climo, Windsor T. White, M. B. Johnson, E. H. Bourne and J. C. Hill.

New York City.—The Manhattan Automobile Company recently leased the private stables Nos. 62 and 66 West 43d street for a term of years, and also the building No. 502 West 38th street.

Portland Ore.—There is some talk of an electric automobile service between this city and Gresham and adjoining towns.

Toledo, O.—It is stated that representatives of the Remington Automobile & Motor Company of New York will shortly be in this city to confer with the chamber of commerce relative to removing its factory here.

Toronto, Ont.—Letters of incorporation have been granted to the Electric Cab Company, Limited, of this city. The company proposes to embark in the automobile business at once. It will establish eight or more electric cabs at regular rates, as well as two electric tallyhos for the tourist trade. C. A. Ward is president of the concern.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½¢@16¼¢.; Lake, 16½¢@17¢.; casting, 16½¢@16¼¢.

The Durham Traction Company, with a capital of \$1,000,000, has been incorporated at Raleigh, N. C.

Brooklyn Rapid Transit stock has been neglected during the past week, but it closed higher than a week ago.

The exports of copper thus far this month amount to 2,457 tons. The market is dull and steady.

Pennsylvania Electric Vehicle preferred sold at 2½ on Saturday, a gain of 1 point. The stock has been inactive for several weeks.

Vice-President E. B. Maltby has been elected president of the Boston Electric Light Company. Director I. T. Burr was elected vice-president.

The elevated railroads of Chicago have held by the January gain over last year thus far this month. The first week of February is said to have shown something like 2 per cent. gain.

In Wall Street it is considered that Pennsylvania Railroad interests are purchasing Brooklyn Rapid Transit stock, and that the system may be leased or purchased outright by Pennsylvania.

An arrangement is said to have been made whereby all the street railways south of Boston owned by the Massachusetts Electric Companies will come under one management, to be known as the Old Colony Street Railway.

It is rumored in Chicago that the Lake Street Elevated Railway Company will consolidate with the Northwestern Elevated Railroad Company, as a preliminary step to a general unification of all the Chicago overhead lines.

The project of a consolidation of the Edison Illuminating Company and the Boston Electric Light Company has been entirely abandoned and the offer of a lease guaranteeing 10 per cent. by the Edison Company has been rejected.

Assemblyman Hatch has introduced a bill in the New York Legislature imposing a State tax of ½ per cent. on gross earnings and 3 per cent. on all dividends in excess of 4 per cent. on all surface and elevated railroads not operated by steam.

Suit for \$50,000,000 has been begun in the U. S. Circuit Court at Chicago by the Atlantic & Western Telephone Company against the American Bell Telephone Company and its subsidiary companies for alleged infringement of a patent on long distance telephones.

The California Copper Company, with a capital of \$2,500,000, was incorporated in Trenton, N. J., February 8 to do a mining business. The incorporators are George H. Sullivan, Henry W. Clark and M. B. Parsons, of New York, and William J. Curtis, of Summit, N. J.

A dividend of 1½ per cent. on the preferred capital stock of the Metropolitan West Side Elevated Railway Company, Chicago, has been declared by the directors, payable February 28 to stockholders of record at the close of business February 18.

Bills have been introduced into the Legislature of New York, Connecticut and Rhode Island, to permit a surface railroad to acquire right-of-way by condemnation. It is thought that these bills are in the interest of the proposed electric line between New York and Boston.

The arguments in the mandamus proceedings against the Union Traction Company of Chicago were resumed on the 8th inst., which practically puts to rest the theory that the company had compromised with the city, agreeing to lower the tunnels in return for franchise extensions.

The Boston Stock Exchange sends out the following: "On and after March 1 the engraved certificates of the Massachusetts Electric Companies will constitute a good delivery. American Telephone & Telegraph Company has been taken from the unlisted sheet and placed on the regular list."

The Boston "Globe" states that the directors of the New Haven Railroad Company have finally decided to make a trial of the third rail system as applied to Boston suburban traffic. Probably the Forest Hills and Dedham line will be the first to be equipped. It is believed the new system can be placed in operation within a year.

At the annual meetings of the three electric railway lines, controlled by the Cataract Power Company of Hamilton, Ont., good showings were made in connection with each company. The reports of each of the lines disclosed a substantial surplus over the operating expenses, fixed charges and the 5 per cent. dividend that was declared.

At the annual meeting of the National Gramophone Corporation, held recently, the following directors were elected: E. R. Johns, George H. Robertson, Frank J. Dunham, W. T. Hepper, Edwin W. Hines, O. D. La Dow and Frank A. Crandall. It was stated that, as the expert accountants are still engaged on the company's books, no financial statement could be presented. The meeting was adjourned to March 6.

An entirely new theory has come to light bearing on the Manhattan Elevated Railroad Company of New York. According to the New York "Times" the New York Central is seeking to lease the road. That journal claims this knowledge was gleaned from a director of the Manhattan, and that it is declared the New York Central will lease the Manhattan much after the same style as it was stated the Metropolitan proposed to lease the road—a lease to run for 99 years, practically in perpetuity, and under its terms 5 per cent. to be paid to Manhattan stockholders for five years (when the system will then certainly be entirely operated by electricity), and 6 per cent. thereafter.

ELECTRICITY.

EDITORIAL NOTES.

The Patent Laws.

While it may not always
be wise to keep continually
revising laws, yet a meas-
ure which has been intro-

duced in Congress for the revision of the pat-
ent laws, along the line of correcting errors
that already exist in those laws through pre-
vious legislation, is one that is necessary.

Prior to its amendment on January 1, 1898,
Section 4,887 of the Revised Statutes limited
the life of all American patents to that of any
foreign country whenever an invention has
been first patented in that country. It was
amended at the date named so that the issue
of an American patent subsequent to that of a
foreign patent was, within certain named limi-
tations, altogether prohibited, but in every
case where the United States laws permitted a
patent to issue at all, those laws alone should
limit the life of the patent.

One section of that amendment repealed
that portion of the section which declared
that where an invention had been previously
patented in a foreign country the United
States patent should be limited so as to ex-
pire at the same time. Under that section,
had it remained as it passed the House, any
patent granted subsequent to the date of the
passage of the act would have been relieved of
this old limitation clause. But this was viti-
ated by a subsequent amendment at the hands
of the Senate, leaving the old statute in full
force as to limitations.

No sufficient reason can be given for refusing
to give applications filed prior to January 1,
1898, the same exemption from limitation by
foreign patents that is given by the act of
March 3, 1897, to applications filed subsequent
to January 1, 1898. While it has never been
the policy of the Government to change the
terms of grants already made, it may fix the
terms of patents to be granted, irrespective of
the time when the applications were filed.

The limitation of the term of American pat-
ents by foreign patents is a great hardship. It
was so recognized by Congress when the
amendment was adopted. The applicant in
this country cannot control the time when his
patent shall issue. If an applicant who filed
his application prior to January 1, 1898, is un-
fortunate enough to be involved in an interfer-
ence which may tie up his application for an
indefinite time, he may be obliged to forego

the obtaining of any foreign patents. Under
the old section, if he filed a single application
abroad and the foreign patent issues before he
can obtain his United States patent, the term
of his patent in this country is limited by the
foreign one. Therefore an opponent in an in-
terference proceeding, finding that the true
inventor has received a patent abroad, though
he may not be able to defeat the true inventor,
may delay the issuance of the patent for years,
and when the true inventor finally obtains his
patent it is for a term which may be limited to
but a few years, if, indeed, the term shall not
have already expired.

As to all patents filed on or after the date
named, the opportunity for this is entirely
wiped out by the act of March 3, 1897. It
would seem to be but fair and just that the
United States should relieve present as well as
future applicants from this hardship, and no
opposition can be made to it, unless it should
come from those who are seeking to defeat
rights to patents by delaying their issuance
through dilatory proceeding in interference.
The Committee on Patents has recommended
that the bill be passed without any unneces-
sary delay.

* * *

Progress of the Rapid Transit System.

Judging from the progress
that is being made on the
underground rapid transit
system for New York City
the first section should be

completed on or near the time originally speci-
fied, namely, three years. At present there
are some 2,000 men at work digging, blasting
and shoring up, while early in the spring this
number, according to the contractor, will be
doubled.

An excellent idea of the immensity of this
undertaking may be gotten by an inspection of
the work already done at 168th street and at
181st street. At both points vertical shafts
have been sunk from the top of the hill to the
level of the roadbed. At 168th street the
shaft, 32 feet in diameter, goes down 100 feet
through solid rock. The center line of the
vertical shaft is east of the roadbed and from
its foot a horizontal shaft extends to the line
of the tunnel where it widens out into a cham-
ber 51 feet in diameter. This chamber is the
underground passenger station. Two elec-
trically operated elevators will run in this shaft
and their carrying capacity and speed will be
sufficient to take care of all the passengers who
may leave a train before the next train comes

along two minutes later. At 168th street the shaft and the chamber are both completed, so far as taking out of rock is concerned. At 181st street, where the shaft extends down 120 feet, there is still some excavating to be done.

Compressed air is made use of for operating the drills. For the work on Washington Heights there is an air power plant near the river. The compressed air is forced up the hill through a six-inch pipe and distributed along the line of the tunneling wherever it is needed. There is another air power plant at Union Square, which furnishes power for operating the drills along the central section between Great Jones and 31st street.

Probably the most important problem to be solved is as to whether pipe galleries should be built in connection with the tunnel undertaking or not. At a recent meeting of the Social Reform Club Mr. William R. Corwine, Secretary of the Merchants' Association, referred in a speech to this subject. He said he had been unable to find anybody who did not agree with him on the general proposition of the benefit of pipe galleries, although some had different opinions as to the details to be considered in bringing about the building and management of the galleries. Speaking of the crowded condition of the present sub-street pipe system, he said it was no system but a general disorder. He recalled the recent bursting of a big water main in the bed of the old 42d street reservoir as evidencing the age and consequent weakness of some of the city's pipes.

In closing Mr. Corwine said that he favored the plan to give the present Rapid Transit Commission charge of arranging for pipe galleries.

Mr. Corwine's views are undoubtedly those of every person familiar with the existing conditions in the streets of this city, so far as underground structures are concerned. By all means let the city build suitable galleries, in which water mains, gas pipes and electrical conductors may be placed.

* * *

An American Exchange at Guadeloupe.

Manufacturers are always on the outlook for new markets, and to such it may be interesting to learn that an American exchange has been established in the city of Guadeloupe, which has for its object the introduction of various lines of American manufactures not known in that market and the substitution of American for other foreign goods in lines that have already been established. For a number of years past our American Consul at Guadeloupe has been endeavoring to get some one to seriously take up such a project, but financial conditions had stood in the way. Recently there has been a marked improvement in these conditions; it may be that it is a reflex wave of the prosperity we are enjoying in the United States which is beginning to be felt in Guadeloupe. Be the reason what it may, conditions are such that they augur well for increased commercial intercourse between that country and ours.

The address of the exchange is "The American Exchange, Pointe a Pitre, Guadeloupe, West Indies," and it is understood that the concern is a responsible one. It is to be located in a building at present occupied by the Chamber of Commerce of that city, and all catalogues and samples are to be well displayed, and special inducements offered to all parties who may be in any way interested to visit it.

The manager speaks and writes English, is thoroughly acquainted with trade relations between Guadeloupe, the United States, France and England. It is his intention to send out circulars of inquiry, and solicit from manufacturers and exporters desiring to do business their catalogues and samples of what they have to offer. The goods to be handled will include steam engines and fittings of all kinds, steam and small pumps, machinery of various kinds, tools, corrugated iron, light portable railroads, etc. An additional opening may be found for electrical machinery, as there are a number of improvements already under consideration in Guadeloupe for the electric lighting of towns and cities, the establishment of steam and electric railroads, bridges, etc., and it is expected that they will be carried out at an early day. The American Exchange will try not merely to secure these important contracts, but to hasten their realization by demonstrating the rapidity and cheapness with which they can be accomplished by Americans.

It may be well to suggest at the present time that it is useless for those who desire to enter into competition for this trade to send catalogues without prices: the fullest and most detailed information should be given, together with the discounts. These figures, with samples, more important than anything else that can be offered, can be used to good advantage by the managers of the exchange, who will depend upon the discounts and other legitimate profits of regular business for its gains. The exchange will pay all freight expenses, duties, etc.; it will also receive on consignment sample orders of articles in well established lines from parties desiring to enter into competition for the business. Another important point to be remembered is that when orders are filled the greatest care should be exercised to see that the goods come up to the sample, and care should also be taken in packing. If American manufacturers will do their share, there is no reason why a valuable market for our products should not be opened, for the trade thus established will in time extend to Martinique and other West Indian Islands.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

ON February 14, Senator Brackett introduced a bill in the Legislature at Albany establishing a State laboratory of electrical engineering at Union College, Schenectady, and appropriating \$150,000 for its equipment.

A LARGE electric pump was tested a short time ago at the Jeunesville, Pa., Iron Works in the presence of 200 mining officials and several electrical experts. The pump will be placed in the Avondale mine of the Delaware, Lackawanna and Western Coal Company.

MR. F. MACIAS, a resident of Zacatecas, Mexico, recently stated that Mexican business men are rapidly adopting the styles and customs of the United States commercial tradesmen, also that electric railway building in Mexico is a matter of most concern to his people at present. In Mexico City there is now in operation about 20 miles of electric street railways, while in many other large cities the trolley is rapidly being introduced. This is ad-

vancement noticeable only during the past few years, but which promises great development. Business in general, is at its zenith, and the future of Mexico gives promise of much prosperity.

OVER the ordinary telegraph wires of the Cleveland, O., police signal system pictures were sent by electricity a short time ago, in a working test of the electrograph. The test was entirely successful and the pictures that were made by the receiving machine were said to be, the best ever sent.

THE electric searchlight that is to be installed on the electric tower of the Pan-American Exposition at Buffalo, N. Y., is destined to attract much attention. The searchlight which is a 30-inch projector will be the most wonderful light of its kind ever erected, and it will be operated on the 360-foot level of the electric tower. In order to more definitely locate this 360-foot level, it may be further pointed out that it is the level at which the tower makes the last contraction, and this is only 31 feet below the extreme apex or highest point of the tower and statue of the Goddess of Light that will surmount it. The beam from this searchlight will flash through the sky with a brilliancy that will cause it to be seen for a distance of at least 50 miles.

ENCOURAGED by what has been accomplished by other technical societies, and what they have recently seen abroad, the Council and Committee on Meetings of the American Institute of Electrical Engineers have arranged for a conversazione to be given by that body some time in April. Through the courtesy of Columbia University of New York, the conversazione will be held in the electrical engineering department, with the co-operation of Prof. Crocker, Dr. Pupin, Mr. G. F. Sever and others of the staff there, and so much interest has already been shown in the matter that a brilliant success is forecast. While the conversazione will be largely social in character, a special feature will be the exhibition of latest electrical apparatus, inventions, etc., in working condition. Mr. T. A. Edison, Prof. Elihu Thomson, Dr. Pupin and others have promised personal assistance in this respect, and as Mr. W. J. Hammer has that part of the programme in hand, and is working hard, it is believed that the demonstration of this kind will be one of the best ever seen in this city, especially as the electrical resources of the University will also be available. Secretary Pope and Mr. W. S. Barstow, chairman of the Papers and Meetings Committee, extend through the press an invitation to all members to contribute features of scientific interest and to give an early notification of what they will do in this respect.

PROF. WILLIAM H. BREWER of the Yale scientific school is the author of a bill presented to the Connecticut General Assembly last week, which will compel every electric railroad in the State to file a map of its lines. Prof. Brewer explains the purpose of the bill as follows: "By having these matters clearly shown on topographical maps it will be possible for any citizen interested in the matter to obtain information in a few minutes. As things are at present it would take hours or days to secure it. The bill is purely in the public interest and I anticipate no opposition to it except perhaps from professional lobbyists. The State is

gridironed from one end to the other with trolley lines on paper. This bill may serve the useful purpose of disclosing whether responsible parties are back of the projected lines and assist in determining whether the charters have been secured principally for the purpose of preventing somebody else from building."

THE trustees of the Rensselaer Polytechnic Institute at Troy, N. Y., have elected Director Palmer C. Rickett, president of the Institute, to succeed John H. Peck, resigned. By this election Prof. Rickett becomes the ninth president of the Institute. Besides writing a history of the Rensselaer Polytechnic Institute Prof. Rickett has been a constant contributor to scientific and other periodicals and is a member of many scientific societies and corporations, viz., the American Society of Civil Engineers, American Society for the Promotion of Engineering Education, the Trojan Car Coupler Company, the Standard Railroad Signal Company and the Chamber of Commerce.

A COLORADO man has invented an automobile for the use of farmers, and, it is said it will do the work of several teams of horses. The motive power for this machine may be either gasoline or electricity. It is adapted to plowing, cultivating, seed-planting or harvesting. The engine or motor is on the forward or drive wheels, which are joined by a long reach to the smaller rear wheels, over which the seat of the driver is placed. A large transverse bar, about six feet in length, crosses the reach-bar at its center. To this transverse bar the plowing, cultivating and other appliances for farm work may be attached. A very important feature of the invention is a mechanism that allows the operator to apply the whole power to any one of the wheels, thus making it easy to get the wheels out of any rut or hole in which they may get stuck. The wheels may be operated entirely independent of each other and by an ingenious steering device the farm "auto" can be turned within a very small compass.

It is said that electricity has been put to a novel use in New Jersey by a man who "wired" his sleigh for the benefit of the small boys who persisted in sharing it with him without waiting for an invitation and at the expense of the bright new paint. The wires were arranged around the "catching on" points and connected with a battery beneath the seat. An insulated cushion protected the rightful occupant. A foot lever providing the necessary opening and closing switch and a little judicious peeping from the corner of one eye supplied the driver with the knowledge of just when to push the button.

A MACHINE, which is attracting a good deal of attention in mining circles, is the Wetherill magnetic separator. This is a machine for separating and purifying such ores as are attracted by an electro-magnet. The principle is not, of course, at all new, but this machine, by the great power of its magnets, and concentration of the magnetic field, attracts many substances which are not affected by an ordinary magnet. Even gold is sometimes slightly attracted, though this is not usual. One of the best machines of this type in existence forms part of the equipment of the mining department of McGill University, Montreal. In this machine, the two magnets have a strength

of 40,000 ampere-turns, and by the peculiar shaping of the pole-pieces, all this force is concentrated into a space the size of half a lead-pencil. The powdered ore is carried on a belt under the poles of an electro-magnet. Just over the belt, and under the magnet-pole, is a second belt, running cross-ways. When the ore passes under the magnet, the magnetic particles of it rise and are held by the magnetic force to the under side of the upper belt. This belt carries them out of the field of the magnet, and they then drop into an appropriate receptacle. Meanwhile, the unmagnetic ore goes through the same treatment again, to insure a thorough separation, and is dumped into another receiver. It is thus possible to separate minerals, which are attracted by a magnet, from those which are not, and even to separate those which are attracted in different degrees.

MR. E. BAILEY, residing in York, England, has invented a means of producing white lead and other metallic compounds by electricity, says the London "Electrical Engineer." This is done by the use of the electric arc, the lead to be treated being kept in a molten state. The metal is acted upon by gaseous vapors, which produce carbonate of lead or any other required lead compound. The fumes produced are blown over into chambers having canvas or fine fabric cloth covers or roofs. The fine dry powdered white lead falls down and the undensable gases pass through the fine canvas roof, thus dispensing with grinding, washing and drying processes. It is claimed that there will be at least a saving of 50 per cent. in production by this process, which has been patented both in England and abroad.

THE Gold Coast Colony, in Africa, will soon receive a large consignment of American machinery, which has been ordered by a gold mining and dredging company. A dredging outfit including an electric light plant, worth in all \$20,000, was shipped to Liverpool last week. It is destined for Africa. When it arrives there it will be divided into more than 3,000 packages, and carried by native bearers 200 miles into the interior.

THE electric transmission line from the immense plant in the mountains of Calaveras County, Cal., was completed to San Jose, February 15, and preparations are complete to furnish light and power to the surrounding country. The value of manufacturing interests will be greatly enhanced by this power installation. New factories are contemplated, and the street railways of San Jose will use the current.

AN exceedingly novel electric clock system has just been installed in the new Washington school building at Lafayette, Ind.. There are twelve secondary clocks all run and controlled by a self-winding master clock, placed in the principal's office. This clock is six feet high and the dial is twelve inches in diameter. There is an indicator showing the exact time of the clocks in the different rooms, and an electric gauge showing the strength of the current used in operating them. The smaller clocks are simple in construction and need very little attention. It being only necessary to keep the battery in order. The hands of the secondary clock register the time every minute. Every sixty seconds the indicator on the master clock moves the hands on all the

secondary clocks and they are kept uniformly correct. This system is regarded as much cheaper than to place regular clocks in all the rooms. It requires no great amount of power to operate the system. Two cells of salammoneic battery are used in the master clock.

THE first power at Shawinigan Falls, Que., was turned on Thursday, the 7th inst. The first wheel and electric generator commenced to move, and the town, which two years ago, did not exist, but now has a population of over 3,000 persons, was lighted by electricity. The generator supplies a comparatively small amount of power, but it constitutes the initial step in a development of electric energy which promises to be the greatest in the world. The initial use of electricity at Shawinigan is notable in that the development of power from water there, with the exception of Niagara Falls, offers more scope than any other point in the world. The company has completed the hydraulic development of 75,000 horse power, which is about 25,000 more than has as yet been developed at Niagara. An electrical installation for 10,000 horse power is being put in place from which the company proposes to take its supply for the city of Montreal.

J. S. CRITCHLEY, member of the Institute of Mechanical Engineers, and manager of the automobile department of the British Electric Traction Company, Limited, of London, has been in this country recently investigating various things connected with the development of self-propelled vehicles. As engineer of the Daimler Company Mr. Critchley laid out the first automobile factory in England and has been an authority on the use and manufacture of automobiles ever since. Referring to the subject in a recent interview he said: "Except for your electric vehicles, New York seems to me to be about two years behind London in the use of automobiles. Your roads and streets are not so well adapted to their use as ours, of course, but besides that, you have not yet achieved the same excellence in model or construction. For speed and endurance some of the French types of automobiles are far in the lead, and I observe that certain French ideas are just now being taken up by some of your manufacturers. Your smaller electric vehicles are in advance of anything I have seen elsewhere, and I think some of your developments along that line will soon be imported by us."

THE possibility that Germany will lay a submarine cable across the Pacific long before the projects of the United States for expediting communication in that ocean are carried out is causing much perturbation among naval officers, who have been urging the project on Congress for the last two years, and this is, heightened by the latest announcement that the Caroline Islands, which were promptly purchased by Germany from Spain after the United States had declined to take them, and which form natural stepping stones half way across the Pacific, will soon be connected telegraphically with the rest of the world. The news comes to the State Department from Consul-General Guenther, at Frankfort. He has information to the effect that Germany and the Netherlands are planning to lay a new cable to connect with the Dutch East Indies, and make them independent of the British cable syndicate.

ARTICLE NO. 15.

TRANSFORMERS.

A very common appliance, and practically an essential feature in alternating lighting, is the transformer, very often termed a converter. With this device current may be produced in a secondary winding of a coil by being acted upon and effected by the inducing condition produced by a primary winding of this coil through which the inducing current flows.

The name transformer might lead to the impression that the actual current is transformed or changed to the voltage required, which however is not the case, as it is a transformation of energy by the application of the laws of induction.

A transformer is an appliance acted upon by the laws of induction, whereby a changing electric current applied to one winding of a coil, called the primary, induces into another coil that comes within the inductive influence of it, and termed a secondary, electrical action, the ratio of the induced electrical action to the inducing current being controlled by the relation in inductive capacity that one winding bears to the other.

There are of course a larger number of different styles and types of transformers on the market, but the law or principle governing their action is the same. The difference in their appearance and method of construction is a result of the ambition of manufacturers to secure the most efficient and practical apparatus.

In transformers we have an excellent example of the transferring of power from one electrical circuit to another without being in any way electrically connected with each other and also without there being any mechanical motion concerned in the transformation. The circuits, although having no electrical connection with each other, must however come within the inductive influence of each other, and also with a view toward efficiency, their inductive relation should be such that practically all the influence created by one coil must act upon the other, that is, it is necessary for the magnetic circuit to be so arranged that the magnetism which is set up by the current in the primary coil shall all pass through the windings of the secondary coil.

Transformers are commonly used to reduce a high pressure, which is used on distributing circuits, to a lower electrical pressure, that may be conveniently and safely used in buildings to operate electric lights. They are also used for creating a higher electrical pressure than that generated by a dynamo. This may be done by so arranging the relation of the windings to each other, so that a much higher voltage will be given out on the secondary circuit than is applied to the primary. In this case the name "step-up" transformer is applied, and the advantage of this method is that a very high pressure can be secured and economical transmission of electrical energy over long distances may be attained. The same laws govern their action as that of the induc-

tion coil explained in a previous article, for a transformer is simply an induction coil in every sense of the word.

Starting at the first principle of the laws of induction, we know that an increasing current in a conductor induces into a parallel conductor a current with a tendency to flow in the opposite direction to the primary current; also when a flow of current is decreasing it will induce a current in a parallel conductor with a tendency to flow in the same direction as the inducing current. Now, understand this applies to parallel circuits or conductors, but in a coil is not every winding and turn of the wire parallel with each other? Then this inducing effect will be exerted on the turns and windings just the same as if it were an entirely separate coil; consequently in a coil an increasing current sets up a field which tends to retard the increase of the current, also when a current is decreasing the field set up then will tend to prevent the decay of the current.

ALTERNATING CURRENT PLANT.

Now apply these laws to the action of an alternating current when applied to a primary winding and you see that the influence set up by itself, acting upon its own windings, practically prevents any current flowing through the coil whatever; of course this will be governed by the magnetic efficiency of its construction and the rate of alternations of the current. Now let us add a second coil or winding that will also come within the magnetic influence. Its windings are also parallel to the inducing current and will be effected by the field produced by the current and will have induced into it a current flowing in the opposite direction to the primary pulsation when the current is tending to increase in the primary.

If the circuit of the secondary winding be complete, then electrical action will go on in this winding, that is to say, there will then exist an actual induced current which will also produce a field that will tend to assist the flow of the current in the primary, or overcome the retarding effect produced by the field of the primary. In fact the magnetic fields produced by the currents in the two windings or coils tend to neutralize the retarding effect that each field has on its own flow of current. The greater the amount of current permitted to flow in the secondary coil, the greater neutralizing effect will be acting upon the retarding influence of the primary field on the primary flow of current, and the more current will flow through the primary coil.

When there is no current being used from the secondary winding, then there will exist no flow of current in that coil and no field will be produced to effect the inducing field, and consequently no current will flow in the primary circuit.

However, when the circuit of the secondary is closed and current is flowing in the secondary winding, then there will be a field set up by it, depending upon the amount of current permitted to flow, and the amount of neutralizing effect on the retarding field of the primary will depend on the strength of this field.

Now you see the amount of current which will flow in the primary circuit will depend entirely upon and be controlled by the amount of current being used from or allowed to flow in the secondary circuit.

The primary usually consists of many turns of small wire, while the secondary consists of fewer turns of larger wire. In constructing a transformer the coils are generally wound on a "former" and are carefully insulated, in fact the insulation constitutes one of the most important features in their construction.

The iron cores which constitute the magnetic circuit of the transformer are usually made of strips on "stampings" of thin wrought iron, laid together and built up around the coil in such a manner that they make a core for the coils and also inclose them in a complete magnetic circuit to prevent any waste of the magnetic lines which are set up by the current in the coils.

The whole is then inclosed in an iron case or shell with the terminals of the coils extending through well insulated holes. Sometimes these terminals end on connectors in a convenient compartment constituting a part of the entire case and usually located at the bottom.

Quite often the case is filled with heavy paraffin oil, and this is considered a good feature as it aids considerably the efficiency of the insulation.

Great care must be exercised in the quality of iron used in the construction of transformer cores, just the same as in the cores of dynamo armatures, as the magnetism is reversed with every alternation of the current, and with the reversing of the magnetic molecules there is a loss of power caused by hysteresis.

There are no transformers manufactured that do not operate at a certain percentage loss in energy caused by hysteresis and eddy currents in the cores. The aim of the manufacturers is to reach in their construction such a degree of perfection that this loss may be made as small as possible.

The figure in this article gives a sketch of the manner of connecting transformers on a circuit and also the circuits from the station transformer on an alternating plant.

This drawing also shows the placing in a circuit of the different apparatus essential to an alternating plant and their respective positions in the circuit.

Article No. 16 will be entitled "Arc Lighting."

Experiments With Wireless Telegraphy.

H. Hodgson Wright recently gave two lectures at Halifax on Roentgen-ray photography and wireless telegraphy. On the latter subject he emphasized the fact that there were three known methods of communicating without the aid of wires—viz., the conduction, the induction, and the wave methods. Having shown how wireless messages were dispatched and received, the lecturer gave a striking experiment of the power of Hertzian waves by means of which a small motor was started at the opposite end of the room.

THE DEVELOPMENT OF THREE-PHASE WORKING IN THE TWENTIETH CENTURY.*

BY VAL. A. FYNN, M.I.E.E.

It is with the greatest diffidence that I approach the task of predicting the probable extent of development of this youngest and highly important branch of the electro-technical industry. Bearing in mind that electricity generally has only been commercially applied since, say, 1880, that the discovery of the principles underlying the particular branch now under discussion only dates from the year 1888, and that it was not until after the historical Lauffen-Frankfort power transmission that the three-phase system came into frequent use, one may well pause before attempting to prophesy what stage of development this system will have reached at the end of the next 100 years.

In the first 10 years of its existence it has made unparalleled progress; will it continue this triumphant course, or has it come within such distance of its ultimate perfection that each successive stage will only be reached slowly and at the expense of earnest and persistent work? I am inclined to think the latter is the case.

By taking a sufficiently sanguine view it would be quite safe to predict a most wonderful future, and nobody would be able to prove to me the error of my ways, since long before the expiration of the term I would be safe beyond all argument.

I will only attempt in what follows to briefly consider the several items which go to make up a three-phase transmission and distribution, point out what improvements are desirable, and those that may be looked for, and, finally, on that basis try to enumerate the principal cases in which the application of this system would seem to be consistent with the best economy.

Little need be said about the prime movers, since any of the well-known motors to-day may be successfully used for driving three-phase generators. The choice of the motor in every particular case will depend entirely on the local conditions, and will be limited only by the necessity of obtaining a steady drive. We are here dealing with alternators, and will no doubt require satisfactory parallel running, the variation of speed during one revolution must therefore not exceed a small value, varying with the design of the alternator. It is well to remember when specifying the limit of such variations that it depends entirely on what percent. of the polar division this variation represents; thus equally good results will be obtained if a variation of 1-128th per revolution be allowed in the case of a 16-pole generator, and a variation of 1-256th in the case of a 32-pole machine. Well-designed generators work very steadily with a variation per revolution corresponding to one-eighth of the polar division, and I know of cases where this figure was increased to one-fourth with impunity. These conditions are now easily obtained, and we find therefore nothing here to stop progress.

The three-phase generators themselves, considered from a mechanical point of view, are the most perfect yet known. Their weight per unit of speed and output is, under favorable conditions, the lowest of any for equal heating. They will stand excessive overloads better than any other type of generator.

*From the "Electrical Review," London.

Yet they are far from perfect; one important, and at present unavoidable, drawback exists. When working on a highly inductive circuit, the drop in pressure which they exhibit with increasing load necessitates the assumption of constants of such magnitude in their design, in order to keep this drop within reasonable limits, as to greatly increase their price. Even when this is done they remain behind their direct-current rivals, since they still require the "constant potential man" to prevent erratic variations of voltage.

Many men are now engaged in attempting to solve this problem; I hope that a solution will be found, but it must be one which strikes at the root of the evil, and does not follow the lines upon which most of the inventors are now working.

In America the old method of rectifying part of the armature current has been revived and so far improved, it is said, as to secure satisfactory compounding. Apart from the fact that such compounding cannot be equally correct for various conditions of phase displacement, it solves the problem but partially, since it does not allow of making the alternators as light as they could be.

It may appear to the one or the other that I am taking up trivial points for discussion; I may as well say at once that I hold the three-phase system to be one with many imperfections, and all of these must be removed if it is to compete successfully in all cases; it is in very few instances only where it is supreme, and then mostly from the fact that it is the only one possible. Where direct current can be employed it is mostly preferable in view of its great flexibility, better efficiency, and owing to its present stage of development, which does not necessitate the presence of the serious objections previously inseparable from the use of commutators.

One of the cases where the three-phase system is supreme is found when it becomes necessary to employ very high tensions in order to secure a reasonable return for the money invested. This brings me to consider how far we may expect to meet this unavoidable demand for even higher tensions with the three-phase generator.

Considering the state of things as they are and are likely to be in the course of this new century, I do not think that the limit for the voltage will be set by the generators. If the worst comes to the worst, the use of step-up transformers is always open to us. Personally, I do not consider the use of such transformers justifiable. There are already a sufficiency of sources of loss in the three-phase system without our voluntarily increasing them.

I would not hesitate to build an alternator generating at 25,000 to 30,000 volts. We have the means at hand to do it, and it is quite possible to take precautions for reducing the risk to attendants in the same degree as is being daily done in the case of other dangerous tensions. To consider a higher voltage would, to my mind, be idle, as this limit is set by the transmission line.

Taking the bare wire overhead line first, although any such thing is out of the question in this country, we are indebted for some of our knowledge on this point to the daring experiments carried out by the Westinghouse Company on some of their installations in California.

Basing my deductions on these and some personal experience with extra high tension, I

consider that we are not likely to adopt a voltage exceeding 30,000. I grant that it will be possible, under specially favorable climatic conditions such as obtain in some parts of California, New Zealand, and perhaps some few other favored spots, to work with a higher pressure, but I must doubt that such working will be sufficiently free from breakdowns to pay. In fact, as a rule, the limit stated will not be reached. Supposing that overhead transmission was permitted in England, I doubt whether our climate would allow of the adoption of much above 15,000 volts.

Quite apart from the question of whether overhead transmission at such pressures is tolerated by a country's laws or not, we must consider whether it is justifiable or not. Such tensions naturally imply great distances; it is, of course, impossible to supervise such lengths of line, and it must consequently be admitted that as soon as the line comes within easy distance of populated districts it becomes impossible. We are thus forced into one of the most difficult points to be answered. We must have recourse to cables. To my knowledge the highest pressure which has yet been transmitted by cables to any appreciable distance is well under 15,000 volts.

Will it be possible to manufacture cables which will carry currents at pressures up to 30,000 volts, such as will surely be required to give full and remunerative scope to the three-phase system in the coming century? I am aware that some of the leading Continental firms have been devoting their energies to the solution of this question.

Personally, I am unable to do more than express the hope that a good result may be obtained; the difficulties in the way are certainly great, but the ultimate result need only be reached by comparatively easy stages.

A very serious difficulty, apart from the actual cable insulation, will be met in the manholes where the cables will be split into sections. The free ends will require very special insulation in view of the dampness constantly present in such places, and the consequent possible disruptive discharges so fatal to cables.

Inductive drop is caused by the armoring of cables carrying alternating currents, and this effect would be greatly increased if three cables of ordinary construction carrying three-phase currents were bunched together. Judicious sub-division of the armoring should, however, greatly meet this difficulty.

The dielectric loss which quite lately has been again brought to our notice by Mr. Mordey's paper of January 10, must not be lost sight of, although this question when looked upon in the right light is not so very hopeless. Previous investigations, conducted on scientific lines, go to show that even with tensions of the order here suggested and such periodicity as would undoubtedly be adopted in transmissions of any magnitude, these losses, under ordinary working conditions, would not be prohibitive.

Some of the experiments decidedly point to an existing state of saturation of the dielectric; whether it is wise to go so far, is open to question. We must also bear in mind, when considering this point, that the capacity of a cable diminishes as the thickness of the dielectric increases with relation to the conductor diameter. Cables for higher tensions would, therefore, show lower capacity. A possible improvement may be found in increasing the

ing face. Pump motors can then be driven by three-phase motors as well as they now are by

haulage gears will, however, give some trouble. Installations requiring a great number of very small motors with constant speeds will preferably be carried out on the three-phase system.

In all above cases the periodicity to be adopted should be about 50, when lighting and power is to be taken from the mains, and may be reduced to suit the required motor speeds when no lighting is wanted, or when that lighting forms only a small percentage of the whole and need not be very steady, as is the case in pits. A very large field of usefulness is open for this system in the electro-chemical industry: many processes can be most successfully and very simply worked by alternating currents.

The most important development of this system is, however, to be looked for in those schemes which necessitate very high voltages:

I am strongly inclined to believe that in all cases where the line working pressure does not exceed 7,000 to 10,000 volts, it will become general practice to use a high tension motor, either synchronous or asynchronous, coupled direct to a direct-current generator, thus obviating the use of a transformer. This combination is certainly slightly less efficient, but its greater flexibility will, in most cases, amply justify its adoption.

adopted, if motors with variable speeds are necessary it need not even be considered. If, however, the source of power is very cheap and no special conditions are attached to the motor speeds, it will pay to use the three-phase system owing to its somewhat cheaper upkeep. This applies more particularly to water-power. In mines there is at present no need for this system; the performance of a good series motor on a coal cutter cannot be bettered; the distances are not so great as to necessitate a voltage higher than 500, and the presence of three cables against only two is undesirable. Later, when the pits are deeper and the galleries longer, it will pay to transmit at high alternating voltage, and transform to the elementary 500 volts, or even less, near the work-

Very low periodicities must then be the rule, and motor transformers will best supply the lighting current, whereas motors will be fed by transformed alternating currents where possible, and by direct current where necessary. Full gauge railways will use the polyphase motors, but the street cars will remain faithful to the direct current series motor.

It would appear from all this that the use of the polyphase system could not have been justified in all the very numerous cases in which it

It is the motor load which requires heavier and more expensive generators, and which lowers the efficiency of the line, owing to the wattless current which it requires. I fear that in this respect there is little hope for improvement. The motor power factor may be somewhat bettered, but I see no chance of bringing it to unity. The recent tendency, and a perfectly justified one, to construct these motors with air-gaps offering greater security from breakdowns, only tends to make the power factor worse. Anyone who doubts the reality of the danger of breakdown, due to smallness of air-gap, need only examine the strikingly stiff bearing construction adopted by the leading firms.

Then, again, the three-phase motor is bound to a certain number of widely spaced speeds,

has been applied, since the conditions for which it is best suited have only been met with very occasionally up to now. I think there is no doubt that this is so, and the reason is not far to seek.

A very great percentage of the installations

chronous converters for supplying continuous current to the railway feeders.

Direct current series railway motors have been considered by them as the only practical means at present at hand for extensive railway systems.

current railway motors and controlled by the methods at present extensively used.

The foreign engineers have, however, made a new departure in omitting the rotary converters and supplying the polyphase current directly to the motors operating the trains.

FIG. 2.—PLAN AND ELEVATION OF POWER HOUSE OF GORNERGRAT POLYPHASE RAILWAY.

worked on this system depend on water for their motive power. Efficiency is, therefore, a secondary consideration, and the choice of the simpler though less efficient system is then justified on the score of cheaper maintenance. The maintenance of a three-phase plant, as compared with a direct-current plant, was some years ago considerably less; the latest improvements in direct current machinery go far to reduce the difference.

For the rest, allowance must be made for the irresistible attraction of novelty, which I am sure was responsible in many cases for the preference given to the polyphase system.

Many other installations are simply due to the fact that smaller firms are apt to follow the lead of some of the larger concerns, without, perhaps, closely differentiating between the conditions of their own case and of those they are following.

In conclusion, I think we may fairly predict that the greater proportion of the large work done in this century will be carried out on the polyphase system. The above remarks, of course, apply to a great extent to two-phase working; the three-phase system has, however, a slight advantage, since the copper required for the transmission line is less

This short serial in four numbers of ELEC-

I.—POLYPHASE ELECTRIC RAILWAYS IN EUROPE.

BY FRANK C. PERKINS.

The operation of electrical railways by polyphase alternating currents is a comparatively new undertaking. The Maschinenfabrik Oerlikon, whose large plant is located near Zurich, Switzerland, has been extremely energetic in the introduction of this class of machinery. One of the most important installations recently completed by the engineers of this company is that of a railway system to the summit of the Jungfrau in the Swiss Alps. Polyphase alternating currents have not been extensively used in America for operating railway apparatus and are considered by most American engineers as still experimental, except in cases of transmission of power with the use of syn-

TRICITY will take up four European railways which have already adopted the polyphase motor for electric traction, using this type of motor directly upon the locomotive. While up to the present time it has been used almost exclusively for mountain roads, it is now in keen competition with the combined direct current systems and polyphase system using rotary converters, and there is great interest taken in the outcome of the competition for equipping the London Underground Railway. Ganz & Company of Buda-Pesth has placed the lowest bid at one million and a half dollars, the polyphase system being cheaper to install on account of the doing away entirely with the synchronous converter and for other important reasons.

The first polyphase road illustrated is that of the "Elektrische Zahnradbahn auf den Gornergrat." The electrical equipment for this road was supplied by Brown, Boveri & Cie of

frame two 90 horse power three-phase motors of the type shown in Fig. 3. Each of the locomotives draws two passenger cars and makes the trip to the mountain top, landing its passengers at the station Gornergrat, seen in Fig. 4. A telephone line is arranged the whole length of the road and instant communication is possible with the power house and various stations. The high tension line carries a current of 5,000 volts, while the trolley or contact line is a 500 volt circuit. The efficiency of the motors is about 91 per cent., the conductors about 95 per cent., the transformers 96 per cent., and the generators 92 per cent. The electrical installation as furnished by the firm of Brown, Boveri & Cie of Baden is said to have given excellent satisfaction. The primary of the step-down transformers is 5,400 volts and the secondary 540 volts while the capacity of the three is 180 kilowatts. The electric locomotives weigh about 10.5 tons, and the nine-

extending its application to various new lines of industry. Northern Brazil, Southern Mexico, the West Indies, Central Africa, India, the Straits Settlements and the Dutch East Indies supply this increasingly important feature of our importations.

ELECTRIC TRACTION ON THE GERMAN ROADS.

Translated for *ELECTRICITY* from "Journal des Transports," Paris, France.

If we except the use of electric locomotives for towing boats and the unfortunate results attained by the Heilmann locomotive, the application of electric traction to ordinary lines may be arranged in two captions.

First—The employment of short electric trains as on the Wurtemberg and the Palatinat lines and also the road running from Milan to Monza. In such instances the service requires frequent trains with light loads, which conditions place the steam locomotive at considerable disadvantage.

Second—The utilization of electricity for moving trains through tunnels, especially at the entrance of a large city, where it is quite desirable to evade the inconvenience of smoke and soot, without closely considering the economy of such an installation. Such cases of electric locomotives may be cited as the Baltimore & Ohio tunnel and also that of the Orleans line and of the Quai d'Austerlitz to the Quai d'Orsay.

The experiments made at Berlin on the line running from Wannore, over a distance of 12 kilometers between Berlin (Potsdam station) and Zehlendorf marks a step in advance, in this respect, that they were made on a much frequented suburban line, with trains weighing about 220 tons, to which electric traction is to be applied according to ordinary practice.

We will add, however, that it is only a trial and that electric traction will be applied to a certain number of regular trains running on time schedule, and also that steam traction is to be retained for all other trains and employed to assist in case of disarrangement to the electric system.

Whatever may be the outcome of this experiment, the attempt is the most interesting and we believe that our readers will be concerned in the following information relating thereto, which we borrowed from the official journal of the German United Railways.

The installation was the work of the Siemens and Halske Company, of Berlin; power is taken from a station constructed by that firm at Gross-Lichterfeld for the railway system at that locality. The station is built at a distance of two kilometers from the railway line and furnishes the necessary electric energy at 750 volts continuous current, which is carried to a railway station at Steglitz, 68,500 meters from Berlin. To compensate for the variations in the consumption of the current, electric accumulators have been placed at the two extremities of the road, Berlin and Zehlendorf; the batteries are made up of 311 and 318 elements of the type ES 44, manufactured by a storage battery manufacturing company at Berlin; the maximum charging current is 500 amperes with a capacity of 814 ampere-hours for a discharge of one hour and 1,138 ampere-hours for a discharge in three hours.

The current is furnished at the station by a dynamo having an interior pole construction,

FIG. 4.—GORNERGRAT POLYPHASE RAILWAY STATION.

Baden. In the second serial an illustration and short description will be given of the Burgdorf-Thun polyphase railway, which was also equipped with three-phase electric locomotives by Brown, Boveri & Cie. The third serial in *ELECTRICITY* will contain details of the wonderful Jungfrau polyphase road, equipped largely with apparatus of the Maschinenfabrik Oerlikon. The fourth serial will have some interesting illustrations and information in reference to the Stansstad-Engelberg Railway in Switzerland.

The three-phase rack mountain railway from Zermatt up to the Gornergrat has a total length of 10 kilometers, as indicated on the map shown in the accompanying Fig. 1. The power house has a capacity of 750 horse power and is equipped with three polyphase generators.

Each of the polyphase generators of the Gornergrat railway power house has a capacity of 250 horse power and is directly coupled to horizontal shaft turbines, as indicated in plan and elevation of power house in Fig. 2. The road is equipped with three polyphase locomotives, each of which has mounted upon its

ty horse power motors operating at 800 revolutions give the locomotive speed about 7 kilometers per hour. The polyphase system seems to be peculiarly adapted for inaccessible and high mountain roads, as will be clearly seen in the review of this serial. Whether it will be extensively used for general electric traction is a question which will undoubtedly soon be solved, for the Swiss and German engineers have entered into this line of work with great energy, and coming into direct competition with the American engineers pushing forward their combination polyphase and direct current system, an answer will soon be forthcoming.

India Rubber.

More than \$100,000,000 worth of india rubber has been imported into the United States during the past 4 years, and more than \$60,000,000 worth in the last 2 years, says the "American Gas Light Journal." A decade ago the annual importations of india rubber amounted to about \$15,000,000; now they exceed \$30,000,000, and are steadily increasing. Practically all of the importations of rubber come in crude form for use of manufacturers, who are constantly

directly coupled to a compound condensing engine of the Borsig type: the dynamo gives a current of 450 amperes at 718 volts, but the current may be carried up as high as 600 volts. Automatic circuit breakers prevent the current reaching a dangerous limit, which might accidentally occur through short circuits.

There is a double distributing feeder for each track to meet the requirements of so heavy a current as is required to operate trains of 220 tons, and each of them is in the form of a low rail placed between tracks, at a distance of 1.57 meters from the center of its corresponding track and .32 meter above the top of the track rails. These conducting rails are mounted on porcelain insulators which are placed at intervals of 4 to 5 meters apart; copper connecting rail bonds are employed to minimize the rail resistance, and guard planks are used to prevent danger to life from accidental contact with the conducting rails.

The return current is taken back to the station by means of the track rails, which are also furnished with copper connecting bonds of high carrying capacity. These track rails are also cross bonded from one rail to the other at suitable distances.

The electric train can carry 410 passengers, representing a total weight of 220 tons. The average speed is 45 kilometers, but a speed of 55 kilometers per hour can be attained and there is a third class car at the front and at the back end of the train, each of them being furnished with three axle motors. This duplication of motor cars prevents changing at the end of the line and also allows of current interruptions when switching. The motorman is placed in the front car and between the two motor cars are intercalated eight ordinary suburban cars. A conducting wire is placed under the train to supply current to the two motor cars, and in case of necessity to a third motor car placed in the center of the train, while a second conductor connects all the motors in such a manner as to permit of their being simultaneously controlled.

Each motor car carries three electric motors directly mounted on the wheel axles; no current above 200 amperes can reach them, and there is such an arrangement of parts in the construction that in case of break-down the two groups of motors cannot be operated except successively, and they cannot be connected in parallel circuit except when the speed is above 20 kilometers per hour.

The general appearance of the train is the same as that of an ordinary train without a locomotive, and it is furnished with Westinghouse air brakes, but an attempt should be made to use electric brakes. The whistle has not been abandoned, for in this case it is operated by compressed air; incandescent electric lamps are used for lighting and they are fed directly from the feeder mains, and finally, small vertical heaters are placed in the motor cars to furnish steam for heating purposes.

During the trial tests observations will be made on the following points:

A—Production of electric current.

1. Automatic registration of consumption in watt-hours.

2. Determination of the fall of potential.

B—Motor cars.

a. Electric meter readings to be made during each trip to determine current used in watt hours.

b. For different trips.

1. Determination of the current consump-

tion and the taking of speed diagrams between each of two stations.

2. The taking of diagrams of the current strength, its voltage and work performed in getting under headway and in stopping up to the time the brakes are applied.

3. Diagram of power used for braking purposes.

4. Determination of the lateral movements of the motor cars.

5. Determination of the effect on the train by the modifications in the incoming current and by throwing the motors out of circuit.

6. Determination of the wearing on the motor car wheel tires.

C—Accumulators. Daily expense of current.
D—Generalities.

1. Expense of maintenance for current conductors and of the total electric equipment.

2. Cost of oils and waste.

3. Expenses of electric train lighting.

4. Expenses for heating.

5. Expenses of the personnel.

6. Cost of taking care of the train other than the electric equipment.

E—Taking of data from a similar train drawn by an ordinary locomotive for comparison.

1. Expenses for fuel.

2. Expenses for water.

3. Cost of locomotive maintenance.

4. Cost of oil and waste.

5. Cost of lighting.

6. Cost of warming.

7. Wages of help.

8. Expense for taking care of the train other than the locomotive.

9. Wear on locomotive wheel tires.

Whatever may be the result of this undertaking it is certain that it will be a source of the most interesting information, and there is no need for our saying that these experiments will be closely watched.

The Metric System.

It looks as if Congress, at last, is going to go on record for giving the country an indication of far greater intelligence than is usually put down to the credit of that body. It is to pass a law making the metric system the standard of weights and measures. Anent this bill we have read, in technical papers, some editorials that rank, for linguistic, almost logarithmic density with any ever furnished for the fun of involutioned absurdity by Mark Twain at his best. One paper talks of Germany still using Whitworth and Stubb wire gauges, "for the simple reason," it says, "that aliquot even sub-divisions, according to the multiples of two, using the inch as a standard of length, seem to come out nearer what is desired in practice than any decimal multiplication or sub-division of any of the metric units so far attempted." What does that mean? Does the metric system do away with two or one, or three or any unit? Germany keeps the Whitworth and Stubb, because it bought them so long ago and sticks to them so closely that it cannot or will not give them up. But for the one argument against the metric system in this country Germany had thirty. There was a different kind of measure in thirty different parts of the empire. If we are wise we will not neglect a system almost universal, and sure to be, in its use. It

is all nonsense to say our people will be bothered by terms. It is as easy to learn the names in the metric system as in any other. If a kilogramme is a trifle more than two pounds, half a kilo, is a trifle more than a pound. A meter is 39 inches, an inch is a thirteenth of a meter, where now it is a twelfth. A mile is 1,000 times a meter, or a thousand times three thirteen-inch feet. Why was 13 inches called a foot? It is no harder to think of a 39-inch standard than of a 36-inch one. If we adopt the metric system, we will win our way easier in foreign markets. If we don't, we won't. That is reason enough for its adoption.

By adopting the metric system of weights and measures, we only put ourselves in line with most of the world. England and we are the only nations not under this most sensible of all systems. Like it or lump it, if we are to hold our own, to say nothing about making gains in foreign markets, we shall have to go over to decimals in weights and measures. It will pay too. For the dollar lost by doing so, thousands will be lost by delay. The commerce of the world will be carried on in decimals. When one thinks of what it meant to Continental Europe to give up their old systems for the metric, we can hardly help laughing at the lame or limping excuses given here and in England for not adopting it. A good and wise way to begin the twentieth century would be to adopt the metric system. The Philadelphia "Manufacturer."

SOLDERING ALUMINUM.

BY JOSEPH A. STEINMETZ.

Upon attempting, with any ordinary solder, to join sheets of the metal, it is noticeable that the mixture does not take hold, but tends rather to run off, or perhaps it will chill, utterly refusing to tin the sheets, and rarely adhering to the aluminum. The reason of this behavior is that there is always present a thin, continuous coating of oxide, which effectually prevents the solder from getting to the true metal beneath. This thin, almost invisible, skin of alumina, or oxide of the metal, is of instantaneous formation, and the surface of the metal may be scraped or filed without even temporary relief because of the immediate renewal of the coating.

The use of fluxes and acids to overcome this difficulty have been repeatedly suggested, without securing satisfactory results, and a new theory tending toward the solution of the problem must needs be approved. Dr. Joseph W. Richards, of Lehigh University, Bethlehem, Pa., conceived the successful practice of overcoming the difficulty by incorporating into the composition of the solder an ingredient that would remove the oxide film during the process of soldering, thereby preserving the surfaces clean until the union of the parts had been accomplished. The solder devised and patented by Dr. Richards carries in its make-up an alloyed flux of phosphorous in tin, the theoretical necessity of the simultaneous action of the flux and the taking hold by the solder being confirmed during many years by the satisfactory results obtained in actual commercial practice.

The high heat conductivity of aluminum is another characteristic of this strange metal, and the refusal of many solders to perform their expected duty is traceable to it. The aluminum quickly and readily absorbs the heat from the soldering iron, and the temperature

of the tool is thus so far reduced that the solder "freezes" at the joint and failure ensues. To overcome this difficulty, which arises in large work particularly, it is necessary to keep the soldering iron very hot, and oftentimes it tends to the betterment of the result to apply heat likewise to the parts to be joined.—"Cassier's Magazine" for March.

Durability of Copper Alloys in Sea Water.

In order to determine whether the durability of various copper alloys in contact with other alloys and metals in the presence of sea water could be foretold from their relative positions in the electromotive series, a number of tests were carried out in the following manner:

The bars to be tested were prepared of a shape similar to that of ordinary test bars, and several being cut from one plate or casting, three of them were tested for strength and extensibility. The results of these tests formed a basis of comparison, the effect of the sea water being judged from the lowering of strength and ductility in the bars which had been immersed. This method of estimating the depreciation was selected because in very many cases the external appearance of a bar remains unaltered, although in reality its structure may have undergone considerable change, and also because the diminution in weight does not give a correct indication of the deterioration in strength.

The bars to be tested were riveted to plates of the different metals and hung in sea water for periods varying from eight months to two years. It was found that the bars suffered considerable injury only when they were in contact with an electro-negative metal, the destruction being more complete the greater the distance apart of the metals of the plate and bar in the series. Those bars endured best which were riveted to plates of metal that were high in the electromotive series. In fact, an electro-positive metal exercises a preserving influence on an electro-negative metal. This was proved in the experiments from the fact that those bars which had been riveted to iron plates or to metals of such composition as yellow metal, naval brass, etc., preserved their qualities much better than those in contact with any other metal. Pure aluminum bronze (91 copper to 9 aluminum) neither itself suffered a rapid destruction when in contact with an electro-negative metal, nor did it induce anything like so quick a deterioration of an electro-positive metal as copper or tin bronze, which proved themselves the most destructive of other metals in contact with them.—Inst. C. E.: Foreign Abstracts.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended February 13:

Antwerp, 2 packages, \$143; Argentine Republic, 36 packages, \$3,351; 3 cases, \$332; Australia, 179 packages, \$10,443; 48 packages electric car material, \$9,917; Barcelona, 8 cases, \$566; Bilbao 1 case, \$30; Bremen, 4 packages, \$401; British East Indies, 19 packages, \$500; British Possessions in Africa, 1,003 packages, \$35,113; British West Indies, 57 packages, \$2,403; 2 coils cable, \$968; 6 cases electric motors, \$227; Central America, 212 cases, \$501; China, 12 bundles, \$505; Cork, 20 packages motor trucks, \$1,300; Cuba, 88 cases, \$2,339; 6 packages, \$550; Ecuador, 1 case, \$23; Florence, 5 cases, \$366;

Genoa, 120 packages, \$12,658; Gibraltar, 5 cases, \$115; Glasgow, 49 packages, \$475; 8 cases, \$1,600; Hamburg, 35 packages, \$5,657; Havre, 41 packages, \$1,972; Japan, 198 cases, \$41,808; 44 cases motors and parts, \$3,528; Korea, 147 packages, \$18,888; Liverpool, 132 packages, \$24,956; London, 447 packages, \$39,647; 28 packages motor vehicles and parts, \$14,075; Madrid, 2 packages, \$67; Manchester, 13 cases, \$2,680; Marseilles, 2 cases, \$225; 44 bales, \$385; Mexico, 96 packages, \$2,153; Milan, 33 packages, \$2,400; Naples, 1 case, \$719; Philippines, 12 cases, \$1,388; Reval, 30 cases electric fans, \$403; Santo Domingo, 8 packages, \$891; Siam, 3 cases, \$329; Southampton, 11 cases, \$800; St. Petersburg, 22 cases, \$251; Tasmania, 4 packages, \$94; U. S. Colombia, 4 cases, \$59.

New York Electrical Society.

The 212th meeting of the New York Electrical Society was held on February 14. Mr. Kempster B. Miller lectured on "Modern Telephone Engineering." Mr. Miller discussed very fully the equipment of the telephone exchange, its functions, and many important engineering problems connected with it. Mr. Miller also exhibited a number of curves, which were of the greatest interest, and in many ways threw important light on improved telephone practice, about which there has been a lack of information in recent years. The lecture was greatly enjoyed by a large audience.

Mr. T. C. Martin, President, announced the election of Mr. C. E. Knox as Vice-president, to take the place of Mr. W. C. Burton, who has resigned in consequence of his continued stay in England.

The following members were elected: A. L. Orton, Munson D. Atwater, Walter L. Thompson, Frank B. Rae, William Kent, A. B. Eads, Jas. R. Strong, Wm. B. Osgood Field, E. L. Elliott, J. M. Wakeman, David Killock, New York City; E. R. Lever, Newark, N. J.

PERSONAL MENTION.

Mr. S. Ichikawa, chief electrician of the Hokkaido Coal Mining & Railroad Company of Japan, has been on a tour of inspection in this country with a view of learning coal mining by the use of machinery, as he expects to install electrical mining machinery in his mines.

Mr. Harry W. Fuller, who was lately appointed by President Allan L. McDermott to the office of general manager of the Washington, D. C., Traction & Electric Company, has accepted his new position.

Mr. Otto W. Meysenburg, the president of the Rodger Ballast Car Company, also of the Siemens & Halske Electric Company of America, and ex-president of the Wells-French Car Manufacturing Company, died last week at Alma, Cal., of typhoid fever. He was 52 years old.

Mr. W. B. Worthington, chief engineer of the Lancashire & Yorkshire Railway of England, with J. T. Tatlow, locomotive accountant of the same railway, were in Baltimore, Md., a short time ago inspecting the electric equipment of the Belt Line of the Baltimore & Ohio, and studying the accounting methods of the road.

Mr. Richard Stockton of Trenton, N. J., has succeeded Mr. Charles Watson as manager of the South Jersey Gas, Electric & Traction Company at Mount Holly, N. J.

Mr. R. E. Slade, formerly of White Plains, N. Y., has accepted the superintendency of an electric plant at Lockport, N. Y.

INCORPORATIONS.

The Citizens' Electric Light, Power & Heating Company, Shreve, O. Capital stock, \$10,000.

The Spring River Electric Power Company, Kansas City,

Mo. Capital stock, \$50,000. Incorporators: F. O. Chesney, F. L. Chesney and E. C. Chesney.

The International Brass & Electric Company, New York City. Capital stock, \$25,000. Directors: Gustave Huerstel, R. A. Scott and Edwin Huerstel of New York City.

The Huntington Electric Light, Heat & Power Company, Huntington, Ark. Capital stock, \$8,000. Incorporators: W. Harper, M. Hayes and J. H. Thompson.

The Sussex Light & Power Company, Trenton, N. J.—to carry on an electric light and power business. Capital stock, \$500,000. Incorporators: F. J. Myers, Hillsdale, N. Y.; R. H. Batchelor, Piscataway, N. J.; A. T. Rice, Rutherford; William Duncan and William J. Schneider, New York.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 12, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

667,730. Electric Brake Mechanism. Frank C. Newell, Chicago, Ill., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa. Filed Aug. 26, 1899.

667,730. Electric Brake. Frank C. Newell, Wilkensburg, Pa., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa. Filed May 2, 1900.

667,764. Electric Switch. David R. Bruce, London, Eng. Filed July 28, 1900.

667,868. Trolley Mechanism. John H. Cook, New York City, assignor to Henry B. Newhall, Plainfield, N. J. Filed July 7, 1899.

667,908. Trolley-Switch. Charles P. Cornell, Baldwinsville, N. Y. Filed June 29, 1900.

667,904. Closed Conduit Electric Railway. Leon Dion, Boston, Mass., assignor to the Electrical Safety Traction Company of West Virginia. Filed Aug. 6, 1900.

667,906. Elevated Electric Railway. Lewis A. Brown, St. Louis, Mo. Filed Oct. 22, 1900.

667,979. Street-Car Fender. George W. Gardner, Philadelphia, Pa. Filed Oct. 31, 1900.

668,057. Trolley Wheel. Francis E. Shaughnessy and George J. Thomas, Newton, Mass.; said Shaughnessy assignor to Thomas C. Knowles, same place. Filed July 17, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

667,980. Terminal Socket. Ernst W. G. C. Hoffmann, Charlottenburg, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Oct. 11, 1899.

ELECTRICAL MACHINERY AND APPARATUS.

667,986. Transformer. Ferdinand Schwedtman and Waldo A. Layman, St. Louis, Mo. Filed June 4, 1900.

668,030. Means for Stopping Electromotors. James J. Wood, Fort Wayne, Ind. Filed Oct. 15, 1900.

668,140. Rheostat and Circuit-Breaker. Henry B. Cutter, Philadelphia, Pa., assignor, by means assignments, to H. Ward Leonard, New York City. Filed Feb. 24, 1899.

TELEPHONES AND TELEPHONE APPARATUS.

668,022. Signal Controlling Relay. Herbert E. Shreeve, Dedham, Mass., assignor to the American Bell Telephone Company, Boston, Mass. Filed Oct. 1, 1900.

668,044. Telephone Switchboard and Circuit. Francis L. Gilman, New Bedford, and Charles H. Herzog, Boston, Mass., assignors to the New England Telephone & Telegraph Company of New York. Filed Nov. 6, 1900.

MISCELLANEOUS.

667,727. Automatic Alarm System. Felix McGiloin, New York City, assignor to the Automatic Fire Alarm Company, same place. Filed May 21, 1900.

667,805. Signaling Apparatus. William A. Swann, Chicago, Ill., assignor of one-half to Hamilton C. Kibbie, Oblong, Ill. Filed Jan. 2, 1900.

667,859. Ship's Telegraph. Frank W. Wood, Newport News, Va. Filed July 11, 1900.

667,875. Running Gear for Vehicles. William L. Garrels, St. Louis, and Clinton Kimball, Kirkwood, Mo., assignors to the Electric Vehicle Company, New York City, and Jersey City, N. J. Filed Dec. 29, 1899.

667,882. Feeder Wire Insulator. Charles K. King, Mansfield, O. Filed Dec. 5, 1900.

667,849. Electric Spark-Coil. Stephen B. Morse, Rahway, N. J. Filed March 21, 1900.

667,958. Alarm Apparatus. Rudolph Segerdahl, Chicago, Ill. Filed Sept. 2, 1899.

668,108. Transfer Apparatus for Electric Batteries. Cyprien O. Mailloux, New York City. Filed Dec. 29, 1899.

668,109. Storage and Transfer System for Electric Batteries. Cyprien O. Mailloux, New York City. Filed April 24, 1900.

DESIGNS.

34,084. Bracket for Telephone Stands. Ray V. Griggs, Chicago, Ill. Filed Nov. 5, 1900. Term of patent 7 years.

34,086. Support for Incandescent Mantles. Max Herakowitz, Chicago, Ill. Filed Jan. 18, 1901. Term of patent 7 years.

THE TELEPHONE WORLD.

The Bell's Low Rate.

The cheapest telephone contract ever made by Charleston, S. C., with the Bell Company has lately been closed, by which the Bell Company has agreed, for a term of three years, to operate all the city 'phones at the rate of \$4 a year. The city contract calls for about twenty 'phones. Bids were asked from the Bell and Gordon, the independent company, and a regular cut-throat business was begun. In order to get the contracts, the Bell offered to do the work for the figure named, and the city took up the offer. Rates of this kind do not go to outsiders, however, and this cheap rate was made simply to get the business. The Bell people say they are losing money by the deal, but preferred to lose rather than have the "official" business go to its rival. An effort has been made to stir up trouble over the contract, but it was made in due form and was ratified by council.

The two companies were requested to make bids for a one-year and a three-year contract. It is understood that the Gordon's offer was \$20 a year for the three-year contract, and the Bell Company was chosen because of its low rates.

The telephone franchise granted the United States Telephone Company of Cleveland by Jackson, Mich., has been accepted and the company will establish a toll office in the business section of the city. A recently constructed line extends from Bay City via Saginaw, Lansing, Jackson and Adrian, to Toledo, where connection is made with its Ohio system. It will also connect with a great number of rural systems which the Bell Company has shut off.

Papers have been made out for a corporation with a capital of \$5,000 to establish a telegraph and telephone line from Lakeview to Silver Lake, via Crooked Creek, Paisley and Summer Lake, Ore., a distance of 100 miles. It is also proposed to wire Lakeview for a local telephone system. The enterprise will be of great benefit to Lake County.

The towns of Riley and Leonardville, Kan., are each to have a local telephone exchange with a toll line connection. The work of construction has commenced. Each of the towns has a population of about 300. Telephone promoters of Central Kansas are so eager to extend their operations that many of the little towns of 150 to 500 are given exchanges.

The Pratt City, Ala., exchange of the Southern Bell Telephone Company will be remodeled in a short time. Telephones of the long-distance kind like those in use in Birmingham, Bessemer and Ensley exchanges of that State will be substituted for those now in use and the service otherwise improved.

The Citizens' Telephone Company, the proposed new company for Memphis, Tenn., last week filed a formal application with Mayor Williams, seeking a permit to begin its construction work at once. Should the city council take favorable action on the matter, the company will begin work not later than the middle of this week.

The telephone system at Red Spring, N. C., changed hands a short time ago, and the new owner put up prices. As a result a nearly complete boycott is in effect, as all but three 'phones have been grounded.

The telephone war in Buffalo, N. Y., has taken on a new phase. A company known as the Jamestown & Chautauqua Telephone Company, and composed entirely of local capitalists, has applied for a franchise. This makes three applicants for favors at the hands of the common council and that body is wrestling with the problem.

The Port Jervis, N. Y., Telephone Company recently decided that it was necessary to increase the capital stock from \$8,000 to \$15,000. Cables are to be put in and new wires raised for the accommodation of new subscribers.

The most important business to come before the Duluth, Minn., board of county commissioners recently was the consideration of the petitions from the ranges for telephone service with the court house. O. D. Kinney made a strong plea in favor of the proposed telephone communication.

A bill regulating telephone rates in cities of the first class at 14 cents for the use of any telephone for five minutes has been introduced in the Legislature at Albany, N. Y., by Assemblyman Scanlon.

The Home Telephone Company of Cortland, N. Y., has issued a new list of subscribers which contains 310 names, exclusive of the Homer exchange.

Michigan's Favorable Independent Telephone Report.

The managers of the independent telephone exchanges of Michigan met in Lansing a short time ago under very favorable circumstances. At the time of the last annual meeting the Erie Telephone Company had just purchased the Detroit independent lines and was reaching out after other exchanges to such an extent that the independent managers were getting nervous, but now the prospect is brighter. Every exchange represented at the meeting reported a growing business, and it is stated that the prospects of the independent companies never looked brighter. The day was spent in discussing rates and transacting business of interest only to the members of the association. The association will hold a meeting next August in Alma.

The following officers were elected: President, J. B. Ware, Grand Rapids; vice president, Orrin Morrow, Benton Harbor; secretary, C. F. Brown, Alma; treasurer, J. H. Fildew, St. Johns; executive committee: J. R. Hyde, Hart; W. O. Hunt, Adrian; C. W. Gale, Owosso; R. F. Johnson, Saginaw.

At a recent meeting of the Le Roy, N. Y., village board Milton H. Wade of Franklinville applied for a franchise to erect poles, string wires and maintain an independent telephone exchange. President Huyck appointed a committee consisting of Trustees Lapp, Rogers and Heaman to look the matter up and report at the next meeting. There are at present about 150 Bell telephones in use in the village, for which residences are charged \$1 per month. Mr. Wade stated that the telephones would not exceed 75 cents per month for residences and \$1.25 for business places.

The Gainesboro Telephone Company, which completed long-distance connections in Carrollton, Ga., last fall, and which has extended its service to Bremen and later to Bowdon, Ga., has finished connections to Victory and Tyus, two important country points in that State, and have begun to extend from Bremen to Waco and possibly will immediately continue to Tallapoosa. It has arranged to start a line to Buchanan, the county seat of Haralson, twenty miles north of Carrollton.

The Hudson River Telephone Company of Albany, N. Y., will hold a special meeting of stockholders on March 7, to increase its capital stock from \$3,000,000 to \$4,000,000, to be used for construction and betterment. The proposed new capital will not all be used at once. The company now covers a vast territory, extending from Westchester County to Utica, and from Albany to Montreal, Canada. The annual meeting of the company will be held on the same date.

The Baiting Hollow, N. Y., Telephone Company has been organized. The officers elected for the new company are E. E. Mosier, president; John C. Young, secretary and treasurer, and Charles Warner, manager. Other directors are: W. V. Young, George F. Terry, Henry Talmage and Eckford Hallock. The company will start with a capital stock of \$1,000. The line will run from Baiting Hollow east, a distance of six miles, and on to Riverhead village, making ten miles in all. The promoters will put in the best telephones they can buy and will start with a good number of subscribers. They hope to have the system working by April 1. The line will be a great convenience to the farmers along the route. The rate has not yet been fixed.

The Standard Telephone & Telegraph Company has been granted franchises in Langhorne, Pa., and work is to be started immediately toward installing a complete system. This company will also extend its line to Quakertown, Sellersville, Hatboro, Ivyland, Forest Grove and Bristol in that State, thus making the independent service very complete in Bucks County.

J. Lowber Welsh, John D. Crimmins, Elverton R. Chapman, Gen. Samuel Thomas, George W. Elkins, Frank M. Riter, Randal Morgan, John C. Bullitt, Jeremiah J. Sullivan and Morgan W. Ayres have been elected directors of the Telephone, Telegraph and Cable Company of America.

A stock company has been formed in Benson, Ill., to erect and maintain a country telephone, with headquarters there, connecting with other lines already in operation. S. L. Peterson, J. E. Eckhart and Ruf Parks are all interested in the enterprise.

Application for a charter will soon be made in Salt Lake City by the new company known as the Salt Lake Mutual Telephone & Telegraph Company.

The Missouri Kansas Telephone Company is extending its long distance line to a number of places south of Nevada, Mo.

A Bill to Prevent Purchasing Rival Lines.

The Hon. George M. Hosack, member from the Fifth District, has introduced a bill in the Pennsylvania Legislature, the first section of which provides, "That no corporation, association, partnership or individual, owning, operating or controlling any telephone line or lines shall acquire, either by purchase, lease or otherwise, any competing line, or the controlling interest in the stock or bonds of any competing telephone line, or in any wise control, operate or own any competing telephone line, or the controlling interest in the stock or bonds thereof."

Mr. Hosack says "the object and purpose of the bill is, as the title indicates, to prevent the consolidation of competing lines for the holding of the controlling interest in the stock and bonds of competing telephone companies, for the acquisition, or control, either directly or indirectly, of one competing telephone company by another."

A charter was lately granted the Hanover and Henrico Telephone & Telegraph Company, with headquarters at Ashland, Va. The directors of the company are W. C. Saunders, E. S. Campbell, M. D. Hart, E. L. C. Scott and John G. Pollard. The maximum capital stock is placed at \$5,000, and the minimum at \$1,000. The company is authorized to do a general telephone and telegraph business, and to acquire old lines or to build new ones.

Manager McElroy, of the independent telephone system to be put in Sherman, Tex., recently said: "We expect to have the line from Denison to Houston completed and in operation in five months and expect to be setting poles and actively at work in Sherman within thirty days and to push the matter just as fast as men can do it."

The judiciary committee of the common council of Chicago, Ill., has under consideration a movement to secure an additional revenue of \$250,000 for the city. It is proposed to tax companies \$5 per pole and 15 cents per linear foot for conduits for all telegraph and telephone companies operating in that city without a franchise.

Some fifteen farmers living in the neighborhood of Branchport, Yates County, and Pulteney, Steuben County, N. Y., have established an independent telephone line. Their wire is now about five miles long. In the future it is expected the line will be extended to Branchport and Hammondsport, and possibly to Penn Yan. The patrons of the system can then keep in touch with the markets.

The New Berlin, N. Y., Telephone Company was recently organized with a capital stock of \$3,000. A switchboard for 100 'phones has been ordered and there is no doubt that as soon as people realize its convenience that number of 'phones will be installed. There are already about 50 subscribers. The rate for business places has been fixed at \$15 per year, residences \$12.

A private telephone line running a few miles south of Thorndale, Tex., for the convenience of a thickly settled farming section, will be erected soon by a number of citizens of Thorndale.

The Ansonia, Conn., Telephone Company has filed a certificate of increase of capital from \$20,000 to \$25,000.

The Independent Union Telephone Company of Batavia, N. Y., has accepted the franchise granted by the aldermen.

The Ogle County Telephone Company of Rochelle, Ill., has increased its capital stock from \$10,000 to \$50,000.

TELEPHONE INCORPORATIONS.

The Wichita & Charlie Telephone Company, Wichita Falls, Tex. Capital stock, \$1,500. Incorporators: W. D. Bently, D. E. Bently, H. T. Dunn, L. P. Amazon and C. B. Felder.

The Maquoketa Telephone Company, Maquoketa, Ia. Capital stock, \$45,000. Incorporators: H. T. Brigham, C. B. Miller, F. J. Spencer, W. H. Solin and P. A. Stuenkel.

The Keystone State Telephone & Telegraph Company, Trenton, N. J.—to construct, acquire and operate telephone, telegraph and cable lines. Capital stock, \$2,000,000. Incorporators: Norman Frey, Edward H. Clew and Wilfred B. Wolcott, all of Camden.

GENERAL ELECTRICAL NEWS.

Lighting.

Archbold, O.—This town contemplates the erection of an electric light plant.

Avoca, N. Y.—This village is discussing the question of municipal construction and operation of an electric light plant.

Canton, O.—Bids will be received until March 2 for furnishing all the necessary labor and material for providing and supplying to this city 35 or more all night arc lights of 200 candle power each, for lighting the streets and alleys. Address L. N. Ley, city clerk.

Carsonville, Mich.—The question of bonding for electric lights will be voted on next month.

Charlemont, Mass.—The money has been appropriated to light the streets and town hall with electricity.

Columbus, O.—Director Kauffman of the department of public improvements has begun the preparation of specifications for the purpose of calling for bids for lighting the city, as the present contracts will soon expire.

Cullom, Ill.—Messrs. Ortman & Fogerty have been granted a franchise to erect an electric light plant here.

Fredericktown, O.—The citizens are contemplating the erection of an electric light plant.

Greensboro, N. C.—The establishment of an electric light plant is being considered. J. M. Bandy, city engineer.

Hammondspoint, N. Y.—There is a growing sentiment in favor of electricity for street lighting here.

Hampton, Va.—The council has considered the advisability of establishing an electric light plant to be operated and owned by the town.

Hedrick, Ia.—The electric light question will be submitted to the people of this place at a special election to be held March 4.

Hogansville, Ga.—The establishment of an electric light is being considered here.

Independence, Mo.—The plant of the Citizens' Electric Light Company was recently destroyed by fire. The loss is estimated at \$5,000. It is proposed to erect a municipal electric lighting plant at once.

Johnstown, O.—An electric light plant will soon be erected here.

Jonesboro, Tenn.—This city has called an election to vote on the question of erecting an electric light plant.

Lawrenceburg, Ind.—The council has authorized the city clerk to advertise for bids for the erection of an electric light plant by the city.

Lincoln, Ill.—The council is considering the question of building an electric light plant for the city.

Live Oak, Fla.—The erection of an electric light plant is proposed and C. Y. Bird can be addressed.

Lompoc, Cal.—A movement is on foot for the establishment of a local electric lighting plant.

Ludington, Mich.—J. S. Stearns has purchased the F. Filer electric light plant in this city. The plant will be moved in the spring and new equipments added, making it a modern plant.

Manitou, Col.—A new electric light company is ready to ask for a franchise here.

Mt. Air, Ia.—W. E. Martin of Atlantic and O. S. Martin of this city have made a proposition to the authorities to put in a \$40,000 electric light plant.

Newburyport, Mass.—The city government is considering the buying of the gas and electric light plant of this place. A committee has been appointed to investigate.

New London, Ia.—The proposition to levy bonds for the purpose of erecting an electric light plant in this city will be submitted to the voters at the coming spring election.

Oregon, Wis.—J. Cramer is making arrangements to erect an electric light plant at this place.

Pennville, Ind.—This town is now figuring on putting in an electric light plant.

Perham, Minn.—The electric light plant here is to be enlarged.

Red Lion, O.—J. Decker is agitating the question of erecting an electric light plant at this place.

River Rouge, Mich.—There is talk of an electric lighting company being formed here.

Talladega, Ala.—The citizens are agitating the electric light question.

Thorp, Wis.—A movement has been started to erect an electric light plant here.

Tiskilwa, Ill.—The citizens of this place are agitating the question of building a new electric light plant.

Toledo, Ill.—Plans are being prepared for the erection of a new electric light plant here.

Youngstown, O.—The Youngstown Consolidated Gas & Electric Company contemplates the enlargement and improvement of its plant. Bonds to the amount of \$600,000 have been issued for that purpose.

Street Railways.

Albany, N. Y.—Expert Appraiser J. H. Ehrehart, of the State Board of Tax Commissioners, has a plan which contemplates using the present system of the Erie canal for the right-of-way of an electric freight railroad, to be owned by the State, that shall do the work contemplated by the proposed barge canal.

Auburn, N. Y.—The Auburn Interurban Electric Railway Company proposes to begin operations as soon as possible toward extending its line from here to Syracuse.

Bedford, Ind.—The city council has granted a franchise to the Bedford Street Railway Company to operate an electric street railway in this city.

Chambersburg, Pa.—The Chambersburg & Gettysburg Electric Railway Company has secured permission from the councils in Chambersburg to construct and operate a railway here.

Danverscott, Me.—A charter has been granted for an electric road between here and New Harbor.

Fort Wayne, Ind.—Andrew A. Purman of this city has succeeded in organizing a syndicate that will consolidate Indiana, Michigan and Ohio lines.

Kansas City, Mo.—The electric motor sweepers of the Metropolitan Street Railway are a success, having in the recent storm met every requirement.

Lawrence, Kan.—L. M. Erb of New York City will ask the city council for a franchise for an electric street railway system. Mr. Erb proposes to build over five miles of track, running the line to the State University and Haskell Institution. He says that he has capital ready to carry out his plans, provided that a satisfactory franchise can be obtained.

Louisville, Ky.—The executive committee of the Louisville, Anchorage & Pewee Valley Electric Railway Company has decided to issue bonds to the amount of \$350,000.

Montpelier, Vt.—The outlook for the speedy building of the Montpelier & Newport Road is most favorable, as the towns along the proposed line are taking an active interest in seeing the project put through.

Roanoke, Va.—A movement is on foot to secure the construction of an electric railroad from this city to Fincastle. Messrs. Benjamin Haden, Judge Breckenridge, C. W. Bowyer and W. R. Allen are interested in the scheme.

Rochester, N. Y.—A stock company, capitalized at \$3,500,000, has been formed by Rochester and New York capitalists to construct an electric railroad from this city to Niagara Falls and Buffalo, following as far as Lockport the line of the historic Ridge Road.

Springfield, O.—J. P. Martin is making arrangements for the construction of an electric street railway between here and Xenia.

Tacoma, Wash.—Two electric railroads are projected between this city and Seattle, both to be built this year. The company is composed of a syndicate of Eastern men who control the street railways of both cities.

Union, S. C.—A franchise has been granted by the city council to T. C. Duncan and associates to build an electric railway in this city.

Company Matters.

Ansonia, Conn.—It is rumored that the Russell-Tomlinson Electric Company intend to move its works out of town in the near future.

Elkhart, Ind.—The stockholders of the new Elkhart Electric Company met recently and completed their

organization. Martin Beige of Mishawak was elected president, Charles H. Tenney of New York secretary, and Charles F. Hewitt of Elkhart treasurer and general manager.

Grand Rapids, Mich.—The Michigan Electrical Supply Company has commenced operation here. J. M. Cooke and W. P. Freleigh comprise the company. This concern carries a full line of electrical and telephone supplies as well as constructing and doing all kinds of repair work.

Holley, N. Y.—The annual report of the Holley Electric Company to its stockholders for the year ended January 10, 1901, shows the company to have had a fairly prosperous year.

Milwaukee, Wis.—At a recent meeting of the stockholders of the Twin City Electric Company it was decided to change the name to the Electric & Water Company, and double the capital stock, making it \$40,000.

New York City.—At the annual meeting of the Edison Electric Illuminating Company of this city the old board of directors was re-elected.

Providence, R. I.—The power producing capacity of the Pawtucket Electric Company and the Bridge Mill Power Company is to be materially increased by the addition of a new engine and new dynamos.

Manufacturing.

Milford, Conn.—Judge Townsend has appointed Samuel L. Galpin of New Haven to be receiver of the Electrical Manufacturing Company of this place.

Montreal, Can.—The establishment of the Northern Electric & Manufacturing Company was recently damaged by fire.

Phillipsdale, R. I.—The Varley Duplex Magnet Company, formerly of Jersey City, has removed its plant for the manufacture of electrical magnets to this place. The company is to be amalgamated with the American Electrical Company located here.

Rome, N. Y.—Clyde & Dyott, proprietors of the Electrical Wire Works, have purchased ground on which to erect a fine factory for their wire drawing business.

Power and Transmission.

Fayetteville, N. C.—The outlook for the Cape Fear Electric Power Company's contemplated work, in which W. M. Morgan is interested, is said to be bright.

Mt. Carmel, Ill.—The Mt. Carmel Development Company will establish a 4,000 horse power electric plant at Grand Rapids dam, two miles above here.

Moscow, Idaho.—The Moscow Electric Light & Power Company and the city council of Pullman, Wash., are considering the matter of having a heavy transmission wire stretched from Moscow to Pullman to furnish electric light for the latter place.

Automobiles.

Chicago, Ill.—Incorporation papers for the Chicago Automobile Transportation Company, with a projected capital of \$15,000,000, to install transportation lines throughout the city, employing 348 electric stages and 180 electric cabs, are being prepared. The capital has been subscribed largely by owners of Chicago office buildings and in the prominent stores.

Oswego, N. Y.—The Tonkin Steam Carriage Supply Company was organized here recently for the manufacture of boilers and appliances for automobiles, with a capital stock of \$50,000.

Syracuse, N. Y.—The National Frame & Metal Company, which was recently incorporated, has leased buildings in this city, and will commence at once the manufacture of automobile gears and bicycle frames. The company is capitalized at \$60,000, with John Dunn, Jr., president; John S. Kaufman, vice-president, and Charles A. Fox, secretary and treasurer.

Toronto, Ont.—The chief of police has lately been considering the subject of installing an electric patrol wagon.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¼c.; Lake, 16½@17c.; casting, 16½@16¼c.

It is stated that negotiations are on for the nationalization of the telegraph systems of the Dominion of Canada.

The Mexican Telephone Company reports for December: Gross earnings, \$15,910; operating expenses, \$8,333; net earnings, \$7,577.

The Nassau Electric Railroad Company's \$10,474,000 consolidated mortgage guaranteed 4 per cent. gold bonds have been listed on the New York Stock Exchange.

The directors of the General Electric Company held their regular semi-monthly meeting on February 15. They gave out no statement and transacted only routine business.

A dispatch from St. Petersburg, Russia, states that an elevated railroad system for that city is being planned, to cost in all 190,000,000 roubles. It is hoped to enlist American capital.

The Kings County Electric Light & Power Company has declared the regular quarterly dividend of 1½ per cent., payable March 1. Books closed February 19 and reopen March 1.

The Electrical Commission of Baltimore, Md., has informed the telephone and telegraph companies of that city that they must have their wires underground by the end of the present year.

The Standard Light and Power Company of Montreal declared a dividend for the six months ending March 1 next at 8 per cent., per annum payable to stockholders of record of that date.

The members of the Rapid Transit Commission of New York City appeared before the Municipal Council on February 13, to urge approval of the plan for the proposed extension of the rapid transit to the Battery and thence to Brooklyn.

It is authoritatively stated that the dividend on the South Side Elevated Railroad Company of Chicago's stock will not be increased at the meeting to be held on February 28. Some time this year, however, the shares may be put on a 4 per cent. basis.

The United Railways & Electric Company of Baltimore reports for the year ended December 31, 1900: Gross earnings, \$4,431,743; increased, \$206,425. After paying operating expenses, fixed charges, dividend on the preferred stock, interest on income bonds, taxes, etc., there is a surplus of \$90,000. The retiring board of directors was re-elected on February 13.

The Third Avenue Railroad Company reports for the quarter ended December 31, 1900: Gross earnings, \$551,735; operating expenses, \$327,508; net earnings, \$224,227; other income, \$5,893; total income, \$230,120; fixed charges, \$440,824; deficit, \$210,704; deficit previous quarter, \$150,867. General balance sheet shows: Cash on hand, \$715,869, and profit and loss (deficiency) \$718,388.

Although the subsidiary companies of the Erie Telephone system have not made up their figures for 1900, it is understood that the estimates thus far made show gross earnings for 1900 of \$4,950,000, or an increase over the previous year of \$1,273,000. The net earnings are estimated at \$1,760,000, an increase over 1899 of \$487,000. The total number of telephone subscribers to this system was on December 31, 1900, 141,589. The net gain in subscribers as compared with the previous year was 35,041.

Advices from Boston state that the directors of the Edison Electric Illuminating Company and of the Boston Electric Light Company are again holding conferences with a view to consolidation. The proposed basis of consolidation is said to be somewhat similar to the original "Morgan" plan as to interest return of 11½ per cent. and 10 per cent. respectively to Edison and Boston Company, stockholders, but proposed amalgamation will be in the nature of a consolidation rather than a lease by a third company.

R. T. Wilson & Company, who held a controlling interest in the stock of the Detroit United Railway Company, which is a consolidation of the street railways of Detroit, have sold their holdings to a syndicate headed by Henry A. Everett, president of the Cleveland Electric Railway Company, and E. W. Moore, vice-president of the Western Reserve Trust Company of Cleveland, acting in connection with Kean, Van Cortlandt & Co. of this city. R. T. Wilson, M. Orme Wilson and James M. Edwards have retired from the board of directors and E. W. Moore, of Cleveland, Arthur Pack, of Pontiac, Mich., and R. B. Van Cortlandt have been elected in their places.

The Boston "News Bureau" states that the railroad commissioners have sent to the Massachusetts House of Representatives their answers to the questions asked by Representative Bullock of New Bedford regarding the Massachusetts Electric Companies. The commissioners state that the Massachusetts Electric Companies is a voluntary association of owners of shares of stock in electric light and steel railway corporations, and as such is not recognized by the board; but the companies in which the association owns shares issue no stock or bonds and effects no consolidation except under the supervision of the board and upon actual exhibit of corporate property and sworn statements of financial conditions.

At a meeting of the directors of the Edison Illuminating Company of Boston held on February 15, it was voted to issue new stock to an amount to be fixed by the Gas & Electric Light Commissioners, probably between 6,000 and 7,000 shares. A meeting of the stockholders will be called within two weeks to ratify the issue of new stock. President Edgar, of the Edison Company, states that the new stock is for the purpose of paying off floating indebtedness and also to refund a mortgage on the plant of the company and has nothing to do with any proposed combination with the Boston Electric Light Company. The present capital stock of the Edison Company is \$4,320,000 and the proposed increase will bring the total capitalization up to \$5,000,000.

ELECTRICITY.

VOL. XX.

NEW YORK, FEBRUARY 27, 1901.

NO. 8.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, ...	\$2.50
IN CLUBS OF FIVE OR MORE, ...	2.00
FOREIGN COUNTRIES, ...	4.00
SINGLE COPIES, ...	10 cents

Sent by Express, Money Order, Draft, Post Office Order or
Registered Letter.

ADVERTISING RATES.

As *ELECTRICITY* reaches all classes interested in electrical
work, its value as an advertising medium can be readily un-
derstood. Rates will be sent on application.
Changes of advertisements should reach the office not later
than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

THE TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY.

EDITORIAL NOTES.

"Electricity's" Educational Series.

It may interest our read-
ers to know that begin-
ning with article twenty
of *ELECTRICITY*'s Educa-
tional Series—which in-
cidentally has proven a great success—Mr.
Eaton will take up the subject of telephony.
These articles should prove invaluable to
workers in the telephone field and will no
doubt elicit as much favorable comment as
those now running. It is the author's inten-
tion to treat the subject in a thorough manner.
The working of the most up-to-date common
battery systems will be explained, and when-
ever necessary the articles will be illustrated.

* * *

The Education of an Electrical Engineer.

In view of the great
amount of attention that
is being given in this coun-
try to the subject of the
training of electrical en-
gineers and workers, a paper
read on the 12th inst. before the Manchester
section of the Institution of Electrical Engi-
neers of England should prove interesting.
The author was Mr. John T. Nicolson and the
subject was entitled "On the Training of Elec-
trical Engineers." After referring to the mat-
ter in a general way Mr. Nicolson states that
electrical engineering is a more exact science
than other branches of engineering, as practice
has been largely directed by a consummate
theory, whereas in other departments theory
has, at its best, only endeavored to understand
and explain practice.

Mr. Nicolson strongly advocates the use of a
laboratory in connection with every first-class
school of applied science. He says: "The
fundamental principles of thermodynamics
may not be of much use in helping a man to
fix the size of the cylinders of a steam engine,
but they will at all events keep him from wast-
ing his time in trying to design a perpetual-
motion machine; and they will show him how
far he can hope to go in the direction of the
improvement of his heat motors, or other
energy transformers.

"But the province of the laboratory in the
scheme of engineering education is—first, to
extend scientific knowledge by providing more
experimental data, and second, to show to the
student the scope, value and limitations of the
theories he has studied in the class room."

Mr. Nicolson gives it as his opinion that
after leaving school a boy should, before enter-
ing college, spend two years in the workshop
of a mechanical engineer. He says:

"I would point out, however, that the work-
shop course here proposed, is merely the prelim-
inary or first part of the student's professional
training. If he has left school with the usual
stereotyped stock of Euclid, algebra and ele-
mentary physics and chemistry, I would have
him take mathematics, physics and chemistry
classes in the evening, but more especially
mathematics, during these two years of work-
shop practice."

Mr. Nicolson then outlines what he consid-
ers an ideal engineering course as follows:

"Having then put in two years in a mechani-
cal engineering work shop, our ideal student
ought to enter an engineering college at about
the age of eighteen, and he ought to study
there for not less than three years.

"The first year of this college course will
usually have to be spent on mathematics,
physics, chemistry, dynamics; mechanical,
geometrical and freehand drawing, and the
study of French and German, which is so nec-
essary for enabling him to read foreign tech-
nical literature.

"In the second year the electrical engineer-
ing student must specialize in the physical lab-
oratory in the direction of electro-magnetic
theory. He must study the magnetic quali-
ties of iron, and the hysteresis loss, and in
doing so he must learn the construction of the
instruments such as the galvanometers, volt-
meters and ammeters he uses in his work, and
the methods of their calibration. All this ex-
perimental work should, of course, proceed
hand in hand with instruction in theory and
numerical exercises in the class room, where
he should be working at electromagnetism and
the theory of the direct-current dynamo.

"In this same year he must apply a consider-
able portion of his energy to the study of ther-
modynamics and hydraulics, and their applica-
tion to steam and water power plants, and he
should devote great attention to the study of
machine design and mechanical drawing. The
electric engineer must have a special knowl-
edge of applied electricity; but he must be
above all an engineer, and not a mere electrici-
an.

"In his final year, three-fifths of the stu-
dent's time should be spent in the laborato-
ries; one-fifth in the electrical engineering de-
signing room, and the other fifth upon lecture

courses connected with his laboratory work. About one-third of his laboratory time should be devoted to experiments on the strength of materials, on the simpler hydraulic phenomena, and to trials of steam engines and boilers. I think that at least thirty days of eight hours each should be spent in this way in his third year. Another third of the time spent in the laboratory in his last year would be occupied in completing the elementary electrical laboratory course he began in his second year. He would after completing his work on magnetic testing, begin a study of the dynamo. For this purpose the laboratory would probably be provided with a number of direct current dynamos of various types and styles of construction, of from 2 to 10 kilowatts capacity, which can be operated either as dynamos driven from a constant speed prime mover, or as electric motors."

The method of procedure for obtaining a thorough education in electrical engineering as outlined by Mr. Nicolson is an excellent one, but differs somewhat from what has been considered the ideal system in this country. As a rule a young man passes directly from school into college, where he gets a thorough theoretical training, and a certain amount of practical information by the use of the laboratory. He then, if in earnest, succeeds in being taken into one of the large manufacturing concerns, where for several years he works at a nominal salary in the shops, learning to apply the theoretical knowledge with which he is loaded. This *modus operandi* has been the means of turning out some of the brightest and best informed electrical engineers in the country.

* * *

An Italian Process for Smelting Ore.

The British Consul at Milan, Italy, recently reported on a method of electrical smelting which was tested in that country. The report states that the merit claimed for the process—known as Captain Hassano's—is one of economy. His experiments were begun in Rome, but have now for some time been carried on under his personal superintendence, by a company formed for the purpose at Darfo, in the Province of Brescia, where a considerable water power is available.

The preliminary operations would appear to be rather costly, as the ore has first to be reduced to powder and then to be mixed with a certain proportion of powdered coal or charcoal, which is necessary for the production of carbonic acid gas. As it would not be practicable to charge the furnaces with this powder, Captain Hassano adds to it, for binding purposes, a sufficient quantity (from 5 to 10 per cent. it is believed) of vegetable tar, and by subjecting the mixture to hydraulic pressure forms a cake, which is cut up into pieces of from 1½ inches to 2 inches square. These pieces are put into the furnace, and the smelting is brought about by intense heat, produced by a voltaic arc. At the end of last month, at Captain Hassano's request, a Commission, composed of five well-known scientific men, spent two days at Darfo, and witnessed a series of experiments. These gentlemen have now issued a very brief report to the effect that they consider the Hassano process to be industrially practical. The Consul states that he has consulted several very competent authorities at Milan, who have carefully followed the development of Captain Hassano's inven-

tion (one of them, in order to have greater facilities for doing so, became a shareholder in the company), and they are of the opinion that, as yet, no adequate proof has been furnished that the new system will not cost more, rather than less, than the one actually in use. Moreover, its application, with any prospect of success, appears to be dependent on the possession of a very abundant water power, at very low price, for the production of the electric energy, the consumption of which is enormous. With regard to the Commission, it has been pointed out that among its members there was no practical ironmaster, and that the report really only amounts to a declaration that ore can be smelted by electricity. All things considered, concludes the Consul, it would appear to be unadvisable to adopt Captain Hassano's process until the possession of the advantages claimed for it has been much more clearly demonstrated.

* * *

The Cables of the World.

Much of the important work of the past decade has been the result of combined capital, brain and muscle, and not one of the important combinations that have been consummated have outranked in importance and in far-reaching results that of the international cable. The entire cable network of the world in 1898 comprised 1,460 lines, with an estimated length of about 192,634 miles. Of this number of lines no less than 1,142, with a total length of 22,867½ miles, were under Government management, the remaining 319, with a combined length of 169,021 miles, were in the hands of private companies.

From the figures available it is shown that these cables are distributed as follows:

Australia and New Zealand have 31 cables under Government control, with a combined length of 397 miles, or .2 per cent. of the total.

British India has 111 Government cables, with a combined length of 2,206 miles, one independent company having 3 cables with a combined length of 168 miles, a total mileage of 2,374 miles, or 1.3 per cent. of the total.

British America has only one cable, which is under Government control and has a total length of 1,056 miles, or .5 per cent.

The Bahamas have one line under Government control, with a mileage of 245 miles.

The English-American Telegraph Company controls 15 cables with a total length of 14,130 miles, or 7.5 per cent. of the total.

Germany has 58 cables under Government control, whose total length amounts to 2,336 miles, in addition to which there is one private company controlling one cable, which is 1,280 miles in length, making a total length of 3,616 miles, or 1.8 per cent. of the total. This is a remarkably small allowance, when it is remembered that Germany's share of the commerce of the world is not less than 12 per cent.

The Government of Great Britain controls 135 cables with a total length of 2,287 miles; to this must be added 19 private companies operating 223 cables having a combined length of 110,609 miles; thus making a total number of 358 cables, and a combined length of 112,896 miles, or 59 per cent. of the total mileage. Thus it will be seen at a glance that Great Britain is consequently almost absolute mistress of the entire cable union, and the 6,000,000 telegrams which travel yearly over the cable route pass, for the most part, through her hands. She has 14 great ocean cables in

working order, 9 of which belong to her exclusively. Africa, America, and India are wrapped about in a network of English cables. One company, the English Eastern Extension, manages over 18,642 miles of cables in East Asiatic and Australian waters.

France has 54 Government cables of 5,788 miles; four private companies operating 28 cables with a total length of 13,602 miles, or a total number of 78 cables with a combined length of 19,390 miles, or ten and one-tenth per cent. of the whole. Under the direction of France beside the control of the Mediterranean Union, is the cable traffic in her West Indian and South American possessions.

The United States has four companies, all of which are private, and the total length of which is 21,131 miles, distributed between 22 cables, thus giving her 11.1 per cent. of the total mileage. The United States is interested in 5 of the cables of the trans-Atlantic Union; and Central America, as far as Peru, is under the almost exclusive control of American companies.

It is rather remarkable to note that while Russia has nine cables all of which are under Government control, the combined length only amounts to 264 miles. Enterprising little Japan has 70 cables to her credit, all under Government control, with a total mileage of 1,734 miles.

The North Danish Telegraph Company, a private concern, operates 24 cables with a length of 8,025 miles, or over 4 per cent. of the whole. Besides its cables on the Baltic Sea, this company manages, with the aid of Russia, the trans-Siberian underground telegraph to Vladivostock, and has extended it from that point to various parts in Eastern Asia. In East Asia are twelve cables, under Government control, with a combined length of 2,048 miles. Spain operates 15 cables, 1,084 miles; Italy, 29, 1,221 miles; all of which are under Government control.

In addition to the foregoing 438 cables are operated by the Netherlands, Belgium, Norway, Sweden, Denmark, and the Northeast sea states, whose combined length only amounts to 839 miles. In other countries, are 178 Government cables, with a length of 2,184 miles, and 2 private companies, operating a like number of cables, with a total of 178 miles.

It is estimated that the total value of this cable network is \$1,190,000,000. It might be well to pause and think, before preaching against combined capital, how very little of this would have been possible without the combination, in fact, whether any of it would have ever materialized.

THE sum of \$2,300 is to be expended by the Inaugural Committee for the illumination of the Court of Honor on the nights of March 3, 4 and 5, in connection with the second inauguration of William McKinley. Wreathing columns of white smoke, issuing from the pyre urns which surmount the immense pylons, will be illumined by electric searchlights, which will cast their shafts of varying colored radiance high into the heavens. Incandescent lights, from 2,500 to 3,000 in number, of 8, 16, 32 and 100 candle power, will illumine the pillars of the 80 foot pylons, the colonnade of thirty-two columns and the four reviewing stands to be erected within the Court of Honor. Within the top of each of the eight pylons will be concealed a searchlight of 10,000 candle power. The rays from these lights will

be cast directly upward. The searchlights will be operated by a man who will be stationed in the top of each pylon. From the pyre urns which surmount the pylons will issue white smoke. The smoke will be made from excelsior and muriatic acid, and transmitted through the urns by means of pipes. The varicolored rays from the searchlights thrown through an opening in the base of the pyre urns will play upon the smoke, producing a scene of most varying and fantastic splendor.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE Twenty-fourth Convention of the National Electric Light Association will be held at Niagara Falls, N. Y., May 21, 22 and 23, 1901. Headquarters will be at the International Hotel.

THE Central Railroad of London, Eng., better known as the Tuppenny Tube, has decided to try American motors instead of the heavy electrical engines now employed, and has ordered from an American company three small motors mounted on bogie trucks under the carriages.

THE steamship *Georgic*, which arrived in New York on February 20 from Liverpool, had on board K. W. Shorman, who had charge of the experiments with wireless telegraphy on the steamer *Georgic* off Brow Head. Mr. Shorman said that he sent messages to Brow Head from a distance of over thirteen miles and received replies, but could not receive messages further than that, owing to the fact that the rolling of the ship somewhat disarranged his instruments. He used a system invented by Colonel Henry Montague Hozier, secretary of Lloyd's London, and Nevil Maskelyne, of the Egyptian Hall, Piccadilly, London. The instrument on the vessel was attached to the metal of the ship and connected with wires which were attached to fore and aft stays of the steamer.

A MARVELOUS system of State canals, the boats to be run by electricity and to be 100 feet long by 25 feet wide, with a draught of 10 feet, and to travel in fleets going from Albany to Buffalo, N. Y., in less than three days, is the plan presented by State Engineer Bond and a capable board of engineers to Gov. Odell. The system is to be built for \$7,000,000 less than proposed by the Canal Commission appointed by ex-Gov. Roosevelt. The canals will be able to carry 15,000,000 tons of freight in a season of seven months.

THE important system of direct telephone and telegraph connections between Norway, Sweden, Denmark, and Germany, which has been in course of construction for some years, has just been completed, says the London "Electrician." The work on the direct telegraph system commenced in November, 1898, when the laying of the cable began between Trelleborg, the southernmost point of Sweden, and a spot near Sassnitz, in the Island of Rügen, on the Pomeranian coast, which has now been finished. The cable is 112 km. in length, with four wires, and it has now been directly connected with Stockholm, via Malmö, on the Sound, by a new 3 mm. copper wire. Through these new cables, direct com-

munications have thus been established between Stockholm and Berlin, Stockholm and Hamburg, Gothenburg and Hamburg, Malmö and Berlin, Malmö and Stettin, and Malmö and Emden. The telephone connections between Denmark, Sweden, and Norway have also been established by the laying of a cable, 20 km. long, across the Sound from Vidbek, on the Danish, to a point near Landskrona, on the Swedish coast. Moreover, through double cables of 4.5 mm. thickness each between Christiania, Gothenburg, Malmö, Copenhagen and Malmö and Stockholm, the central and south of Sweden has been placed in direct telephone connection with the two neighboring States. The Swedish and Danish capitals will shortly be in direct telephonic connection with the north of Sweden and Lapland, whose iron mines are proving a veritable Golconda. A line of 4.5 mm. copper wire is now being laid to the north. This line will in time be continued along the new Trans-Scandinavian railway, now under construction, to its terminus, Ofoten Fjord, on the North Atlantic shore. In the above-mentioned cables, having a total length of about 2,000 km., there have been used about 400 tons of bare copper wire, and the cost has been kept within the estimated grants. To Sweden it is a matter of interest and importance that whereas copper wire had formerly to be bought abroad, all the quantity used in this case has been manufactured at home, much other material being also of Swedish make.

A MEETING of the Executive Committee of the Canadian Electrical Association took place at Montreal on the 12th inst., at which arrangements were made for the annual convention to be held at Ottawa. It was decided that the dates of the convention should be the 19th, 20th and 21st of June next. A strong local committee was nominated to arrange for "papers and topics for discussion," and also to make the necessary arrangements for the meeting, which gives promise of being a most successful one.

FOR the month of January the expenditure on the subway of the Rapid Transit System in this city, exceeded \$600,000, and about \$2,500,000 has now been paid out for this great enterprise.

THE Brooklyn Rapid Transit Company in order to secure good service will establish a school of instruction for motormen. It will be located at the 58th street depot. Each man will receive two weeks' instruction. Applicants for positions as motormen or conductors will have to take a "school car" out and operate it under the supervision of a skilled employe. Tracks for the operation of skeleton cars, with dummy motor boxes and brakes will be laid. The men will be taught the details of operation, the application of the electric current and its results in reversal.

IN view of the fact that the United States Post Office Department is making every effort to increase the efficiency of the rural free delivery service, it is probable that electric railways extending into outlying suburbs or running through sparsely settled farming communities will be called upon to assist in the rapid and frequent delivery of mail matter. It is interesting to note that the earliest successful experiment in the collection and

delivery of mail matter by trolley cars was that made about ten years ago in St. Louis, Mo., by Major John B. Harlow, at present United States Civil Service Commissioner at Washington, D. C., who was then postmaster at St. Louis. The idea of collecting and distributing mail matter by means of especially equipped trolley cars running to the outlying parts of the city occurred to him, and was soon put in practice, and its immediate success was the cause of the adoption of similar plans in many other cities. As may be readily understood a considerable part of mail matter collected by trolley mail cars never passes through the general post office, as it is sorted, cancelled and distributed along the route by the clerks, who form the working crew of the car. In this manner the often limited capacity of a general post office is greatly relieved.

THE Grand Canyon of the Colorado in North-eastern Arizona was visited last season by hundreds of tourists, and in order to handle the anticipated increase this year a scheme of establishing an automobile line from Flagstaff, Ariz., to the Grand Canyon is being entertained by local capitalists. S. E. Farcte, who conceived the idea, has gone to Chicago to make arrangements.

THERE has recently been installed at Liverpool, Nova Scotia, an electric marine railway of a novel character. The equipment of this railway consists of a 30 horse power induction motor, the motor being geared to a heavy worm shaft and wheel, the worm wheel shaft carrying a pinion wheel which gears into another large wheel, on the shaft of which is placed a large, heavy sprocket wheel; over this sprocket wheel the heavy two-inch chain meshes into heavy sprocket teeth. This chain hauls the vessel upon a cradle over a track projecting out into the River Mersey to a distance of 500 feet, on a grade of $\frac{1}{4}$ inch to the foot. The track and cradle are built of heavy pine timbers. It formerly took from four to five hours to haul up a vessel, by the motive power hitherto supplied by horses, whereas the same work is now performed by electricity in 20 minutes. The present railway is the first one in America and probably the first one of its kind in the world operated electrically.

GEORGE T. EYANSON, a young electrician of Philadelphia, Pa., is credited with the invention of a new electric battery, economical and easily applicable to traction and lighting. The invention is covered by between thirty and forty patents. Application for patents has also been made in Great Britain, Canada, Germany, France, Austria and Belgium. Eyanson has worked in secret on his invention for seven years, and now that it is completed heavily capitalized companies have been formed to support the invention. Automobiles, according to the plans of the organizers, will first be fitted with the Eyanson system. After that lighting will be taken up. There is said to be no leakage of energy from the new battery, and that a system of recovery has been perfected by which the power producing properties of the battery are brought back to their original state at trivial cost, and with the great advantage of being chemically pure. The Eyanson battery, it is claimed, can be built into a vehicle, and requires only fresh solution from time to time. It is added that it is far less limited in its radius than the ordinary storage battery.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 16.

ARC LIGHTING.

Early in the nineteenth century Sir Humphrey Davy, an English scientist, gave the first demonstration of the electric arc, and the high degree of illumination which could be secured by it. At that time the dynamo was unknown and the means for producing the current was by the use of primary batteries, as the fact that electrical action could be produced by chemical means was already known. It is understood that this scientist made use of several thousand cells of primary batteries in the demonstration. The terminals of the circuit he connected to two pieces of charcoal, and then by slightly separating the two pieces secured an arc of light of dazzling brilliancy, such as probably had never before been produced artificially. This discovery created a great deal of interest at the time, but not until the introduction of the dynamo, quite a number of years later, was this experiment put to any practical use, and then was started the development which has resulted in the perfect system and application of arc lighting as we have it to-day.

If the two terminals of a battery or dynamo, of sufficient electrical pressure, be connected to two pointed pieces of carbon, and current allowed to flow over the circuit by placing the points of the carbons together in electrical contact, the tendency of the current will be to heat the carbons where they join on account of the resistance offered at this point to its flow. If the carbons be then slightly separated, the current will continue to arc or flow across the intervening space, and the energy expended by the current in overcoming this resistance creates heat, which causes the two points of the carbons to come to a very brilliant white heat. The heat of the electric arc is so intense that the granules of carbon become vaporized, and this vapor existing in the space between the carbons creates a better path for the current than air alone, and consequently the current continues to flow.

When two carbon pencils are united by an electric arc the points of the carbons gradually waste away and the pencils become shorter. On account of this it is necessary to provide an automatic feeding device which will operate in such a manner as to keep the space between the carbons uniform and also to separate the carbons, called drawing the arc, when the current is first applied. The styles of mechanisms and manner of operation for accomplishing this are as varied as the manufacturers, although most all direct current arc lamps involve the same principle in their operation. This principle generally provides for an inductive wound coil placed in series with the lamps, which performs the part of drawing the arc by operating magnetically on an armature which is mechanically attached to the rod that holds the top carbon; also another coil of much higher resistance than the former, connected in shunt with the carbons, that is, across the arc. The magnetic condi-

tion of this coil will depend entirely on the distance between the carbons, or in other words, the resistance of the arc. This coil is so arranged that when the magnetic condition increases a certain amount, it releases a feeding mechanism which allows the top carbon to feed downward. The mechanism may be arranged for adjustment in such a way that the magnetic strength of the shunt coil will act against a spring or it may be made to act against the magnetism of the series coil.

It would be out of the question to attempt a description of the mechanisms involved in accomplishing a uniform feed by this principle as there are so many; however in most cases they can be easily understood upon examination.

FIG. 1.

The construction of an arc lamp does not require so much inventive capacity as ingenuity and good mechanical knowledge, and the improvements that have been made consist more in the simplification of the feeding and regulating arrangement than in any alteration of principle.

As a result of being exposed to air, the carbons gradually burn away, the positive pencil being consumed with twice the rapidity of the negative, since its particles are being continually carried away and deposited on the latter, many being partially consumed in the process. In this manner the extremity of the negative carbon becomes slightly pointed, and a crater-like hole forms in the end of the positive. The appearance of the points of the carbons, after the current had been applied for some time, would look very much like that shown in Fig. 1, if observed through smoked or colored glass.

I might state here that it is very injurious to the sight to examine an arc closely with the

naked eye, and would suggest that when this has to be done some medium be used to look through, such as smoked glass.

When carbons are too close together a sort of hissing sound will be given out by the action of the current. When the arc is too long the carbons will flame at the points. The proper burning distance is when the carbons are operating in such a position that the arc will neither flame nor hiss. Flaming of an arc may also be caused by impurities in a carbon, so consequently it does not always indicate that the arc is drawn too long.

The rate in which carbons are wasted away when a lamp is in operation depends on the size and quality of the carbon and also on the amount of current flowing. Lamps that are constructed for all night use usually have a double set of carbons, so that when one set is entirely wasted away by use the controlling mechanism automatically shunts the circuit to the other set.

Arc lamps usually operate at a pressure ranging from 45 to 50 volts and it is given as a standard, and generally accepted, that an arc having a flow of $9\frac{1}{2}$ amperes has an illuminating capacity of 2,000 cp. and one using $6\frac{1}{2}$ amperes as 1,200 cp., whereas a lamp using only 4 amperes is said to have a brilliancy of 600 cp. This is used as a standard rating and generally accepted although it is a question whether the actual candle power given out under those conditions reaches anywhere near these figures.

On a direct current lamp the positive carbon is the hottest and has the greater illuminating incandescent surface when in action; consequently as a result of this and of the crater shape it assumes, the greatest amount of light is given out at about 45 degrees downward. For this reason the best illuminating effect in street lighting can be secured when the lamp is suspended about the center of the street and 25 or 30 feet from the pavement.

It is easily discernible whether a lamp is burning "up side down" or not by noticing the direction of the most brilliant rays. This can be more readily seen in interior illumination than in outside lamps.

As a general rule arc lamps are connected in series so that the same current passes through each lamp in a circuit. This is made possible by the use of a series wound dynamo so regulated as to keep the magnitude of the current uniform. This is very important in the proper regulation of the lamps.

One advantage in the use of series arc lighting is the saving of copper in construction as a great many lamps may be operated on one circuit and the carrying capacity does not have to be any greater for 100 lamps than for one.

Multiple arc lamps are constructed to be operated from incandescent circuits and they are divided into two classes. Those adapted for use on direct current and those adapted for use on alternating current. It has only been within the last few years that alternating lamps have arrived at such a degree of perfection as to in any way rival the direct current lamp.

The alternating current arc does not effect or burn the carbons, just as described in Fig. 1, but both points become slightly hollowed or crater shaped.

Focusing arc lamps are usually constructed in such a manner that the feeding mechanism operates both the upper and lower carbons and in such a way that the arc will be maintained in one particular position. These styles of

lamps are commonly used for searchlights and in theatrical effects. Usually a special quality of carbon is used and often considerably larger in size than the ordinary ones. Sometimes as high as 20 or even 30 amperes of current is used in lamps of this description. In several cases where focusing lamps are used as searchlights they have been made to operate at as high as 20 amperes. The largest searchlight at the World's Fair in Chicago used 160 amperes.

A TUNING SYSTEM FOR WIRELESS TELEGRAPHY.*

BY ANDERS BULL.

The tuning of wireless telegraphic apparatus is a question that has so often been discussed in the columns of this journal, that most readers probably are acquainted with its importance. This article will describe a system by which a solution of the problem can be arrived at. The system was invented by the writer of this article one and one-half years ago, and details were given at the meeting of the Electrotechnischer Verein, Berlin, on December 18 last. By this system the possibility of messages being intercepted by stations for which they were not intended will be almost precluded, and independent signaling may be carried out between a considerable number of stations lying within the sphere of influence of each other's waves, while several dispatches can be transmitted simultaneously without their being affected the one by the other.

For this purpose the signals are conveyed from the transmitters to their corresponding receivers exclusively by the aid of series of impulses, each series consisting of a certain number of short wave impulses following each other at predetermined intervals of time. By suitable choice of these intervals the impulses can be arranged in series of different form. Now it is possible to tune each transmitting and receiving pair for its own special form of series in such a way that the transmitter only dispatches series of this special form, and the corresponding receiver only responds to series of the same form.

Fig. 1 in the diagram shows two transmitters, 1 and 2, with their two receivers, 3 and 4, arranged according to this principle. Suppose the left-hand one of these sets to be tuned for the series *a, b, c*, the one on the right for the series *d, e, f*, as shown in Fig. 2, where the time-intervals are represented by lengths on

the axis OT, and the impulses by cross strokes.

The transmitter consists of a paper tape 5, which, by means of clock-work 6, is drawn from the reel 7 at as even a rate as possible. The tape first passes through a perforating device, forming a hole in it by each depression of the key 8. The punching of the holes is performed so rapidly that the movement of the tape is not interfered with; a ratchet wheel 9 is released and makes half a revolution, by which one of the two projections 10 strikes against the punch attached to a spring. In a line with the punch, a number of contact brushes 11, supported by metal pieces, 12, are arranged, adjustable for various distances apart, and they press lightly against the tape 5. The brushes 11 are electrically connected together, as well as their supporting pieces 12. While the tape is moving, every hole must pass the brushes, which are generally insulated from their supporting pieces 12 by the paper, and metallic contact will momentarily be effected

sent from the cell 21 excites the relay 22. This then closes by attracting its armature, a secondary circuit, containing the battery 24, a decohering device 23, and the electro-magnet 25. The latter releases in like manner, as described above, a punching device 26, and a hole is formed in the tape 27. The hammer at the same time knocks upon the coherer, the resistance of which is again increased, and the relay 22 and magnet 25 release their armatures. The receiver is then ready to respond to another impulse, and, consequently, each arriving impulse is indicated by a hole in the tape 27.

In the receiver the same number of brushes as in the transmitter are arranged in a line with the punch. The points of contact between these and the metal pieces 30 are, however, not connected in parallel like those of the transmitter, but in series, so that a current from the battery 31 can only first flow through the writer 32, when all the brushes

between each brush and its support through the hole, causing the current from the battery 13 to excite the relay 14, the armature of which is attracted. Thereby connection is established between another battery 15 and the primary of an induction coil 16. Then a discharge takes place between the spark balls 17, connected in the usual manner with the earth and the mast wire 18, a wave impulse being caused to emanate from the latter.

The hole must pass all the brushes, and by passing each a new impulse is produced. As the tape is moving at an approximately constant speed, the intervals occurring between such impulses must, consequently, correspond with the distances between the brushes 11. At each depression of the key 8 a hole is formed in the tape, and, as a matter of course, a special series of impulses is sent out by the transmitter. By various adjustments of the brushes 11 the form of this series can be altered to any desired extent.

At the receiving station the waves impinge upon the mast wire 19, which is connected to the coherer 20. At each arriving impulse the resistance of the latter is reduced, and the cur-

are simultaneously in contact with their supports—i.e., when there is one hole under each brush. As the tape 27 at the receiver is unwound by means of clockwork 28, at an approximately constant speed, the distances between the holes made by the punch when impulses encounter the mast wire 19 will correspond to the intervals of time at which the impulses arrive. The greater these intervals are, the greater will be the spaces between the holes.

A series of a certain form will always, therefore, produce a group of holes at distances apart, corresponding to the intervals between the impulses. If, then, the brushes of a receiver are arranged at the same distances apart as the holes in such a group—i.e., in such a manner that, at a certain position of the tape, each hole in the group is covered by a brush—a simultaneous contact of all the brushes can only be effected by series of a similar form as that transmitted. The current from the battery 31 will then, so long as the simultaneous contact lasts, flow through all the points of contact and the writer 32, the lever of which will be attracted, and a dot be printed on the tape 33.

*From the "Electrician," London.

Each corresponding set of apparatus can thus be adjusted for its own special form of series. If several transmitters are working simultaneously, all their impulses on each receiver within their sphere of influence will be indicated by holes in the tape 27, and the latter will assume an appearance somewhat similar to Fig. 3. A receiver will, however, only respond to those of the punched holes that have the same mutual spacing as its brushes. The filled-in holes in Fig. 3 may thus represent groups by which the left-hand receiver in Fig. 1 will be put into action.

It might appear as if groups of this kind could also be formed accidentally by holes produced by impulses intended for other receivers, but this may easily be prevented. For this purpose the various series must be formed in such a way that the time-intervals between any two impulses in them are all different. If, by making the intervals short, the space of time between the successive series of each transmitter is always sufficiently great in relation to the length of the series themselves, then in no instance can the groups of holes produced by one of the transmitters contribute more than one hole to the formation of one group of holes of another kind. In order, therefore, that any critical group of, say, four holes could be formed accidentally, the number of the simultaneously-worked transmitters would also have to be at least four. If, in consequence, their number is but three, accidents of the kind described are precluded.

For the purpose of making this plain I shall call the special series of four transmitters respectively: *a, b, c*; *d, e, f*; *g, h, i*; and *k, l, m*. The series should then be chosen in such a manner that none of the following 24 time-intervals are alike.

<i>a, b, c,</i>	<i>d, e, f,</i>
<i>a + b b + c,</i>	<i>d + e, e + f</i>
<i>a + b + c</i>	<i>d + e + f</i>
<i>g, h, i,</i>	<i>k, l, m,</i>
<i>g + h, h + i</i>	<i>k + l, l + m,</i>
<i>g + h + i,</i>	<i>k + l + m.</i>

As each of the above series consists of four impulses (three intervals), any three of the four mentioned transmitters can be worked simultaneously without the possibility of an accident happening. Some series that, for instance, would satisfy requirements are: 9, 4, 15; 2, 6, 12; 11, 5, 17; and 3, 7, 14; where the intervals are expressed in suitable units of time. It will easily be seen, that, no matter how one places two of the corresponding groups of holes above each other, these will never have more than one hole in common.

According to what has already been stated, the number of the transmitters, worked simultaneously, should not exceed the number of time-intervals in the series employed. Only by providing the apparatus with more brushes, the number of transmitters could be increased. It might, however, appear in practice, that this number could confidently be greater than according to the above condition; in any case that would depend greatly on the careful and exact manufacture of the apparatus.

It must be noticed that a synchronism between the clockworks 6 and 28, by which the paper tapes in the transmitter and receiver are unwound, is not necessary, as long as the relation between the speed of the tape and the spacing of the brushes is alike in both apparatus. The more perfectly this is attained the smaller can be the size of the holes in relation to a certain rate of the tape 27, and the

less will be the chance of critical groups being formed when the number of the transmitters exceeds the number of the intervals in the series.

As shown above, for each depression of the key 8 of a transmitter, a dot will be printed on the tape 33 of the corresponding receiver. If, then, the Morse code be employed, two dots, closely following each other, might represent a dash. It would be better, however, in this case to furnish the apparatus with two independent systems of brushes—i.e., to tune each corresponding set for two special forms of series, and use the one for dashes and the other for dots. The transmitter would then be provided with two keys, and the receiver with two writers, one of which would mark the dashes, the other the dots on one and the same tape 33.

The system is especially suitable for the type-printing apparatus of Hughes. As each

itself. The apparatus are entirely independent of each other. Any station is, therefore, capable of sending several different messages as well as of receiving some and sending others at the same time.

My system can also be adapted in telegraphing by wire. In this case the relay 14 at the transmitting station might send current impulses from the battery 15 direct into the line, this being at the receiving station connected to the magnet 25. Especially by employing the Hughes apparatus, I consider my system practicable for wire telegraphy.

The apparatus can also be made in other and more practical forms, but as this article is only intended to explain the principle of the system this form has been chosen to illustrate it in a simple way. The apparatus can be made, for instance, by using an arrangement of a number of pendulums with a similar period of oscillation, so that the evenly-running devices neces-

FIG. 1.—LOCOMOTIVE ON BURGDORF-THUN ELECTRIC RAILWAY.

letter requires in such apparatus only one short current impulse, it is only necessary to tune each corresponding set for one form of series. Each current impulse is transformed at the transmitting station into a series of wave impulses, which at the corresponding receiving station again is transformed in a single-current impulse. One great advantage that would be gained in using the Hughes apparatus is that the messages exchanged could be kept secret, for the transmission of the signs, by means of series, would render an illegal interception of the dispatches very difficult; such interception would be impossible when Hughes apparatus is employed.

Instead of, as in the above-described arrangement, allowing decohering to take place mechanically by a knock of the hammer, automatic coherers could be employed—for instance, those invented by Tommasina and by Neugschwender—as they would act with far greater precision and rapidity than others.

In my system it is immaterial where the various transmitters and receivers are placed, whether several apparatus are mounted at one and the same station, or whether each is by

sary for the apparatus above described could be dispensed with; this, of course, would greatly simplify the management of the apparatus, as they would only require winding like clocks from time to time, and no further attendance would be wanted.

II.—POLYPHASE ELECTRIC RAILWAYS IN EUROPE.

BY FRANK C. PERKINS.

The Burgdorf-Thun Polyphase Railway.

This line is in Switzerland and joins together three of the main lines radiating from Berne. The line to Alten is met by this road at Burgdorf. The line to Lucerne is met by this railway at Konolfingen, and the line to Interlaken is met at Thun. The Burgdorf-Thun three-phase railway is a standard gauge polyphase road and is 40 kilometers long. The energy is derived from the Kander power house, where the current generated has the high potential of 16,000 volts. The contact or trolley line has a potential of 750 volts. There are two polyphase locomotives on this line of the type

shown in Fig 1, each of which is equipped with two 150 hp. three phase locomotives, of the type built by Brown, Boveri & Cie of Baden. This line is also equipped with six motor cars, each having four 60 horse power polyphase motors. It will be noted by the accompanying

are each connected with a rheostat placed under the car and each operated independently of the other. On starting the car the controller throws all of the resistances in with the motors, and the controller gradually throws out the resistances until the rotors are finally

tons. From the trolley lines two sliding contacts convey the current to the motors, the third connection being through the wheels of the locomotive. The rotors of the two motors on the locomotive are provided with rheostats and sliding contacts for purposes of control.

PROFILE OF BURGDORF-THUN POLYPHASE RAILWAY.

profile of the line that the grade from Burgdorf to Konolfingen, a distance of 16 miles, is very high, there being an up-grade the whole distance; while from Konolfingen to Thun there is a heavy down grade throughout the entire distance of nine miles. The whole line is operated by the polyphase system and there are on an average of 20 trains per day between Burgdorf and Thun. The power house on the Kander is close to Thun and is located at Spiez. The generators in the power house supply a 4,000 volt current, which is transformed to 16,000 volts by step-up transformers. The current is carried at this tension from the power house along three overhead copper wires, of 5 millimeters cross section, to the step-down transformers located at two-mile intervals along the line between Thun and Burgdorf. At these sub-stations the current is transformed down from 16,000 volts to 750 volts and conducted to the two hard drawn copper trolley wires which are each 8 millimeters in diameter, the rails forming the third conductor. The total capacity of the power house on the Kander is 3,600 horse power. Four turbines are used of a capacity of 900 horse power each. These turbines directly connected to four double current (single phase and three-phase) alternators are seen in the accompanying illustration, Fig. 2, of the interior of the generator room at Spiez.

The single phase current is used entirely for lighting and the three phase current for power transmission. The switchboard in the Kander power house is noted in Fig. 3. The generator room is 33 meters long and 11.5 meters wide, and provision is made for six turbines and generators. The motors used are of the eight-pole three-phase type and give 64 horse power when connected to a line of 750 volts potential and a frequency of 40 cycles per second. Four of these motors are used on each motor car, which has a total weight of 32 tons when equipped. The frame is about 50 feet long and six and one half feet wide, the wheel base being 7 ft. 2½ in. Each car has a seating capacity for 66 persons. The trailers are much lighter and only weigh about a third as much as the motor cars. The motor synchronism speed is 600 revolutions per minute, which would give the car a speed of nearly 36 feet per second or about 24 miles per hour. The four motors are connected in parallel and operated by two controllers, one at each end of the motor car. The four rotors

short circuited. The speed is kept nearly constant in spite of the heavy grades, only 2 per cent. change being noted on the grades from the normal speed of 39 kilometers per hour. By using the automatic tachygraph only the above small variation is noted from the high grade of 1 to 40 to the level, and the same remarkable effect on down grade is noticed, the speed only increasing 2 per cent. on a grade of 1 to 40.

For freight traffic on the Burgdorf polyphase

SHAFTINGS AND COUPLINGS.

"If half the attention which is being paid to figuring up the horse power of engines was given to looking out for shafting, the coal bills would be much smaller than they are now." This remark, made by one of the best known engineers of to-day, one, by the way, to whom the indicator is an open book and whose knowledge of "figuring horse power" makes many an engineer envious, rather set me to thinking.

FIG. 2.—KANDER POWER HOUSE OF BURGDORF-THUN POLYPHASE RAILWAY.

road electric locomotives are used of the type shown in Fig. 1. They are specially designed for the purpose and were built by Brown, Boveri & Cie. They each have a capacity of 300 horse power and are capable of hauling a maximum train weight of 50 tons at full speed up the steepest grade of 1 to 40. The locomotive weighs 30 tons, thus leaving only 20 tons for the train, but by reducing the speed of the locomotive by gearing to half speed, this will allow it to draw 70 tons up the steepest grade of 1 to 40, the total train load then being 100

How many engineers to-day are sure that their hundreds of feet of shafting is in line? Very few. Now, this is all wrong. It should not be enough to know that the shafting is in line and level when it is first set up, but care should be taken to see that it keeps so. The constant strain of belts has a strong tendency to draw a shaft out of line, while the continual though apparently unperceptible settling of all buildings loaded with heavy machinery of course must throw it out of level; then, too, there is quite a difference in shrinkage in tim-

bers, and that will draw more or less upon the hangers, which has practically the same effect, so that our worthy brother engineer's remark is one that should set us all to thinking.

In the first place, are you using any more line shafting than is necessary? Now, you will all say no, as a certain engineer told me in reply to the question some years ago, when, as a matter of fact, his principal weaving mills were driving just twice the amount of line shaft that was actually necessary, for instead of making one line of shafting do for two floors by belting the second room up through the floor from shafting in the room below, they had run their main lines for each floor separate.

Now I do not claim that it took twice as much power to drive that shafting as it would had it been set up the other way, but it required considerable more.

My reader may say, "Well, the man who put it up must have been unwise," but an expert

if he happens to have a slight dislike for the belt man, the leather worker is sure to be to blame for any ous the shafting may show. If the machinist happens to be in disfavor it is laid to his door, and not infrequently the engineer, who may be less at fault than any of the others, comes in for his share of the censure.

An amusing but somewhat aggravating case came under my notice a few years ago when a large plant was compelled to shut down on account of the breaking of four out of seven of the bolts in one of the main shaft couplings, the heads of which were all broken close to the shank.

"Mr.—, how do you shut down your engines?" asked the man in charge.

"Why, the same as I always have," came the answer.

"Well, after this I want you to shut them down slower; you'll break every shaft in the mill if you keep on."

FIG. 3.—KANDER POWER HOUSE SWITCHBOARD, 4,000 VOLT SIDE.

was hired to come out from Boston and plan out the system, and, as the engineer remarked, he ought to know what he was about. Yes he ought to, but did he? Just look your plant over and see if there are any lines or counter-shafts that you could dispense with.

Another source of extra friction, which, of course, means wasted power, is in ill-fitted couplings which throw your shafting out of line.

"Yes, it is a trifle out," as an engineer said to me when I called his attention once to a hanger that was "wobbling," "but we cannot fix it, for the coupling is on crooked," and so he kept on shoveling coal costing \$4.65 per ton for the privilege of allowing that shaft to wobble.

Another thing which seems very strange to the uninitiated is how a man in a superintendent's position who knows little about power, aside from the fact that he once ran a machine of some kind, will set himself up as an authority in regard to where trouble lies when the shafting is out. But it is a fact, nevertheless, but when you come to analyze it you can often find a "method in his madness;" for instance,

Had the engines ever been "plugged" they might have yanked the shaft, but as they were condensing machines with a vacuum strong enough to keep them in motion several seconds after the steam was shut off, the agent's remarks merely caused a smile from those better informed.

Then, again, the bolts were a driven fit in the coupling, and had it been possible to have broken them by stopping and starting, they would have given away in the center instead of at the heads.

The correct solution of the trouble—which, by the way, all the machinists knew at the first—was found when putting in the new bolts; they were obliged to jack up one side of the coupling three-eighths of an inch to bring it level. It had simply worked open and shut with each revolution of the shaft until it had broken the bolt heads, all because it was out of level and the coupling situated just so as to catch the strain.

One of the best investments in cash a large establishment can make is to have its line shafting gone over often enough to be sure it is running with as little friction as possible.

Now it is not necessary to hire a professional millwright to properly hang a shaft; many a carpenter or ordinary machinist can do a very good job in this line. The tools and other appliances are very simple and easily obtained; the only other requisite is to know how, and every engineer at least should know that.

In determining the size of a line of shafting and the distance between hangers, it is better to have it too large and the hangers close than go to the other extreme, but there is a "happy medium," and it should always be looked for. No entirely exact calculation can be made to determine the limit of diameter of shaft and distance of supports, for the strain on a line of shafting is not a constant one.

Weights of shafts and pulleys may be calculated, but the absolute tension of belts, under varying circumstances of starting and stopping machinery, cannot be exactly determined. Formulae for these purposes are only in a measure correct. Suspending a length of shaft, with its weight of pulleys between supports to detect deflection, if any, makes no account of the variable strain of belts, nor is there any calculation in this trial for the rotary movement, and the centrifugal force developed and the vibration resulting.

In hanging a line of shafting, a strong fish line, or still better, what is known as a china line, is essential, and sometimes a fine steel wire is used. The wire, however, is apt to give trouble by sagging.

Of course this sag must be rectified as the hangers are placed, but very few really good men use it, the linen line being far better for getting the hangers in line. The leveling is done by means of a straight edge, a parallel-edged board, of six or eight inches in width. A spirit level on the upper edge of this board, the lower edge resting in the boxes, determines the level from box to box. The string ought not to be lined along the bottom of the boxes, because it is quite difficult to tell by the eye just where the center of the box is, but it should be drawn along the lower edge of the box where it is milled for the upper half or cap. In leveling hangers, shingles are a very handy adjunct for "shimming." After the shaft and pulleys are in place, it should all be gone over again with the level—for this it is well to have on hand a rectangular block of iron, eight inches or so in length by two inches square, planed perfectly true on two opposite faces. Then have one of these faces planed to a V recess—a right-angled gutter from end to end.

When this side is placed on any shaft up to three inches in diameter or more, the block will be in perfect line with the shaft, and a spirit level may be laid on it with certainty that it represents the true level of the shaft. The practice of trying to level by placing a spirit level on the shaft itself is apt to be misleading, for if it rests diagonally in the slightest degree it will not register level and then the pulleys often interfere to prevent its use.

There is another method which is very handy to try the level of shafts at all times. Make a strongly-braced rectangular frame of wood long enough to reach from the shaft to about four feet from the floor. The two side pieces of the frame have feet at right angles at their upper ends, so that they will fit upon the shaft as the iron blocks before mentioned. They also have a cross bar at the bottom, and one or more between that and the top, enough at least to make the frame rigid. If this frame

is properly made, a spirit level placed on the lower bar where it can be seen easily will show when the hooked ends rest on the shaft, whether it is level or not, and the width of the frame will allow it to be used without interference by the pulleys. In using this, it is always well to have it reach from one side of a hanger to the same side or end of the next, and it should not only be tried on each side of the hanger, but in the centers between them or as near it as it can be placed.

Couplings should be very accurately fitted to the shaft, and should receive a final facing up after being keyed to place. The bolt holes should be reamed through both halves of the coupling while they are on a short arbor exactly fitting the bore, or on the shafts, and the bolts should be made to fit the holes accurately.

Nothing is gained by placing one-half of a coupling to project and the other to allow the shaft to project, and to fit into it. This is only a fancied convenience in hanging. The portion of the shaft resting in the projecting half coupling does not tend in the least to strengthen the line. The bolts alone can do that.

There are patented couplings which are no doubt excellent in their way, but there are very few, if any, which are superior to the old flange coupling, or disk, so-called—two flanges with hub and smooth faces having a backward projecting rim extending over the hubs to cover bolt heads and nuts. The diameter of these increases by so much the stiffness of the shaft, and taken all in all, there are very few improvements upon them. There is no doubt that fully one-half of the shafting running to-day is out of line or not level. Now here is the complaint, also the remedy, and it ought not to be a hard matter to connect the two.—The "National Engineer."

LONDON NOTES.

(From our London Correspondent.)

The Underground Electric Railroads.

For half a dozen different reasons underground electric tube railways have been a pretty general subject for discussion in London electrical engineering and railway circles recently. The reports of the various companies have been issued and the results of the operations of the Central London, the City & South London, and the Waterloo and City lines—the three in actual daily working—during the year 1900 have naturally been receiving a great deal of attention. From a financial point of view the results are not calculated to support the boom for "tuppenny tubes." Several things are at once apparent, viz., that there has been proved to be a vast amount of traffic at hand ready for these underground systems, that the capital expenditure is enormously heavy, and that the methods of electrical operation are by no means finally decided. The Central London has carried enormous traffic and has had big receipts, but it has had heavy working expenses and finds itself face to face with conversion from one electrical system to another. The statements as to vibration troubles along the line of route are generally thought to be greatly exaggerated, and the attempts which are being made by some to prevent railway concessions being granted without precautionary vibration clauses being inserted

are considered by those in a position to form a generally correct estimate, to be without any prospect of success. The Board of Trade has, it is true, relegated the vibration difficulty to a committee of scientific eminence, and that committee has been speedily pushing on with its work, but the opinion of Mr. C. G. Mott, an old railway man, and chairman of the City & South London Electric Line, has just been expressed to the effect that any such clause cannot be inserted in any railway bill unless it appears in all, and if it appears in all, then railway enterprise will be brought to a standstill, and the public interests badly injured. Vibration is to be found along the line of any ordinary railway on the road surface and the populace is more or less accustomed to it. Mr. Mott's opinion is that the matter in connection with the Central London has been worked up in an exaggerated manner, and he is convinced that the Board of Trade report, when published, will prove how comparatively unimportant the vibration is. The trouble on the Central London is considered to have arisen from the great weight of the locomotives, and partly in connection with the permanent way construction. It is of interest to mention here that the City & South London Railway, which also operates on the locomotive principle, but with very small locos, has been perfectly free from complaints as to vibration annoyances ever since it commenced running, now nearly eleven years ago. Mr. Mott states that the reason of this is that the City & South London trains have always been made up as light as possible. To run light-weight short trains, and a very frequent service, has been the idea which has been followed up by the board, and this is maintained to be the right principle to follow in connection with these underground systems according to practical experience on the City & South London. It appears that the weight of an entire train on that railway (loco, carriages, etc.) is not more than the weight of the electric locomotive alone on the Central London. Both railways do a 2½ minute service at present. The City & South London runs a three coach train, and hopes shortly to run a four coach, so as to accommodate the early and late heavy traffic. But this weight question is stated (we quote the view of Mr. Mott and many others) to be at the root of the trouble, and the general opinion favors multiple units instead of electric locomotives. It appears to be practically certain that some system of multiple units will be adopted for the working of the Metropolitan undergrounds, although at the time of writing it is not definitely settled whether Ganz & Co. shall have the contract at \$2,000,000, or somebody else at a much larger figure. It does not appear probable that an English firm will secure this work after all, but it will be known in a few weeks for certain. It should be of some importance to American electrical promoters and financiers to watch the vibration question with the utmost care, for its effects upon the promotion and carrying out of the many other underground twin tunnel schemes for London cannot fail to be momentous, especially if enterprise is to be restricted by the imposition of hampering clauses such as mentioned. Mr. Mallock, who is an expert of some experience in the matters of train resistance and acceleration, etc., is acting upon the Board of Trade's express instructions, making a series of experimental investigations and observations as to the actual extent of the

vibration alleged to be caused. His report will have an important bearing.

The Waterloo & City Electric line, a quiet but very useful sort of line, which is a great convenience for certain cross London traffic but never gains much general advertisement in the daily press by being roundly abused like other electric lines are, is still going on satisfactorily. For the past half year it has paid its ordinary 3 per cent. dividend, has carried an extra quarter of a million passengers, making over 2,000,000 for the half year, and is doing fairly well on the whole. It is only a short line and not calculated to make any great stir in the "tube" way at any time.

The great Northern & City Railway Company, which is to run from the city out to Finsbury Park is making headway with its constructional operations. At present 2½ miles of tunnel have been completed and about a quarter of a mile is being added every month. Sir Charles Scotter, the leading spirit in this railway, says that "the construction of these underground works is complicated, difficult and expensive." Larger tunnels are being built than on the Waterloo & City, with which Sir Charles is also associated, as the advantages of larger tunnels are now being appreciated. They will admit of the largest rolling stock made, and will enable the carriages with side doors to be opened at the side when in the tunnels. This cannot be done on any of the existing electric lines and the point has been seriously brought forward in connection with stoppages which have occurred. The company will be able to adopt, if it thinks proper, the multiple unit system. This announcement is of some importance in view of the fact that originally heavy electric locomotives were intended and were stated in the public prospectus.

It only remains to add that the City & South London Railway has been passing through troublesome financial times lately. It never did pay much of a dividend and everyone was hoping that the opening of the extensions to Clapham and city would set things fairly on their feet. These two extensions have been working for six months, and the dividend for the half year is lowered instead of being increased and shareholders are now told to hope that in six months' time when the Islington extension is completed, things will finally turn the corner and the dividend improve. The capital outlay has been very heavy, and more is being spent every month on the Islington line, but there will be beyond a doubt a great accession of traffic from a vast northern area at present uncatered for as regards the city connection, when tubes run from Islington to Moorgate street and from thence to Clapham. These several sections are building up a system, which in future years will work in with other like lines, in a most convenient way.

To Exploit a New Invention.

A COMPANY has been organized at Vancouver to exploit an invention of Capt. Power, of Westminster, which utilizes the force created by the passage of a steamship through the water so as to accelerate the speed of the craft and supply power sufficient to light the vessel by electricity. A working model has been built and patent rights have been secured in several countries. New York men, it is said, have advanced part of the necessary capital, securing an interest in the invention.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Manchester, Robertson & Allison Company has been incorporated at St. John, New Brunswick, with a capital of \$800,000 to supply electric light and power.

The town of Port Dover, Ont., is about to vote on a by-law to loan the sum of \$10,000 to the Canadian Steam Carriage Company to establish a factory for the manufacture of automobiles in that town.

The city council of Halifax, Nova Scotia, at a recent meeting, decided to at once install a municipal electric light plant, at an estimated cost of \$100,000. A special committee of the council has been appointed to select a suitable site for the power house.

The fire and light committee of the city council of Kingston, Ont., recently asked the Kingston Gas & Electric Light Company to name a figure which it would accept for its plants. The committee hoped to reach terms without the expense of an arbitration. The company, however, having announced its willingness to accept \$373,000, the council considered the proposition too high, and accordingly gave the committee instructions to proceed with arbitration. It is said that the price claimed by the company is double what an arbitration will likely award.

American Institute of Electrical Engineers.

As the regular date of the 151st meeting fell on Washington's Birthday, it was postponed by direction of the Committee on Papers and Meetings to Thursday, February 28, at 8:15 p.m. On that date a paper will be presented by Mr. William J. Hammer, entitled, "Important European Electrical and Engineering Developments at the Close of the Nineteenth Century." The following topics among others will be treated: Three-phase railroad work; telephonograph; Nernst lamp; Osmium lamp, etc.; high furnace gases and big gas engines; the "SO₂" engine, etc.; steam turbines; electric plowing; Langen suspended railroad, etc. The paper will be profusely illustrated with lantern slides. It is expected that Poulsen's telephonograph will be shown in operation.

Applications have been received from the following candidates which will be acted upon March 22d:

Wallace Clyde Johnson, Geo. Andros Thomson, James Remsen Strong, New York City.

Ray Mitchel Van Vleet, Dwight Carrington Rockwood, Edgewood Park, Pa.

Samuel Sumner Edmands, Columbus, O.

Arthur Langley Mudge, Montreal, Canada.

George A. Cooke, Honolulu, H. I.

Robert Wilson Bull, Palmerton, Pa.

Henry Allison Albin, Concord, N. H.

Winthrop Keith Howe, Buffalo, N. Y.

John Williams Thomas, Hokendauqua, Pa.

The Executive Committee will meet at 26 Cortlandt street at 3 p.m., on Thursday, February 28.

Proposals Invited.

The Treasury Department Supervising Architect at Washington, D. C., will receive sealed proposals until 2 p. m., March 18, for the completion (except heating apparatus, electric wiring and conduits) of the U. S. postoffice at New Brunswick, N. J.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended February 20:

Antwerp, 66 packages, \$11,567; Argentine Republic, 31 packages, \$1,288; Australia, 37 packages, \$2,037; Bradford, 95 packages motor trucks, \$6,525; Brazil, 46 packages, \$2,708; 65 packages electric railroad material, \$2,688; Bremen, 3 cases, \$1,082; Bristol, 2 crates trolley wagons, \$263; 38 cases, \$3,540; British East Indies, 2,751 packages, \$301,350; 9 packages, \$485; 9 cases motor vehicles, \$713; British Guiana, 19 packages, \$399; British West Indies, 3 packages, \$75; Brussels, 8 packages, \$178; Central America, 21 cases, \$373; Chili, 4 cases, \$60; Christiania, 1 package, \$89; Copenhagen, 1 package, \$30; Cuba, 29 cases, \$398; 1 crate auto vehicles, \$300; Danish West Indies, 1 package, \$8; Dutch West Indies, 2 packages, \$70; Ecuador, 6 packages, \$200; Gibraltar, 6 packages, \$1,300; Glasgow, 128 packages, \$17,581; 56 reels electric cable, \$20,873; Hayti, 1 case, \$17; 176 packages, \$18,089; Ipswich, 18 cases, \$2,500; Liverpool, 13 cases, \$2,750; 11 packages, \$400; London, 336 packages, \$12,222; 7 cases motor vehicles, \$5,000; Manchester, 3 packages, \$300; Mexico, 224 cases, \$4,844; 9 packages, \$5,000; Newcastle, 8 cases, \$1,600; 37 packages, \$5,583; Odessa, 26 cases, \$290; Rotterdam, 1 case motors, \$52; Southampton, 2 cases, \$132; Trieste, 1 case, \$75; 3 cases motor vehicles, \$850; Venezuela, 62 cases, \$988; Vienna, 3 cases, \$231.

PERSONAL MENTION.

Mr. Henry Rustin, chief of the Mechanical and Electrical Bureau of the Pan-American Exposition at Buffalo, N. Y., makes his headquarters on the Exposition grounds, and under his personal attention splendid progress has been made in the electrical installation which is destined to entertain and delight all who visit the Exposition.

Mr. L. C. Maddux, formerly of Kentucky, has succeeded Henry Spencer as manager of the Bristol, Tenn., exchange of the Cumberland Telephone Company.

INCORPORATIONS.

The Electric Insulation Company, Trenton, N. J. Capital stock, \$400,000.

The Chico Gas & Electric Company, San Francisco, Cal. Incorporators: John Martin, Fred H. Pierson, H. U. Roeding, H. R. Noack and William M. Pierson.

The H. E. Lindsey Electrical Supply Company, St. Louis, Mo. Capital stock, \$5,000. Incorporators: H. E. Lindsey, James F. Coyle, P. E. Chapman and D. W. Oviatt.

The Gannett Electrical Company, Brookings, S. D. Capital stock, \$30,000. Incorporators: W. Gannett, W. Gannett, Jr., and G. P. Hall.

The Big Bend Light & Power Company, Spokane, Wash.—to furnish electric light and power to towns on the Central Washington branch of the Northern Pacific.

The Douglas County Electric Company, Roseburg, Ore. Capital stock, \$10,000. Incorporators: L. A. Walker, H. Warren Smith and E. J. Walker.

The Magnolia Electric Light Company, Magnolia, Miss. Capital stock, \$10,000.

The Columbus, Findlay & Toledo Electric Power, Fuel, Light & Railway Company, Larue, O. Capital stock, \$10,000. Incorporators: A. J. Jones, J. H. Leonard, R. W. McVay, J. D. Miller, G. W. Kemp, M. J. Gottschalk and A. M. Hastie.

The London Power & Electric Company, London Mills, Ill. Capital stock, \$2,500. Incorporators: Frank Shelly, Frank J. Dains and Edgar S. Marston.

The Electric Laundry Machine Company, Chicago, Ill.

The Enterprise Electric Light, Heating & Power Company, Garner, Ia. Capital stock, \$25,000. Incorporators: E. C. Abbey, M. B. Cooper, F. E. Blackstone, C. S. Terwilliger, H. M. Andresen, J. W. Knadler, A. Kelly and G. E. Troeger, all of Garner.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 19, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

668,151. Trolley-Switch. Max D. Baron, New York City. Filed May 15, 1899.

668,158. Car-Fender. Peter Best, Elizabeth, N. J. Filed Dec. 11, 1899.

668,170. Electric Railway System. Ed. W. Farnham, Chicago, Ill. Filed Oct. 17, 1900.

668,174. Trolley Wheel and Harp. Joseph D. Forrer, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed June 8, 1900.

668,233. Brake for Electric-Railway Cars. Emmett W. Stull, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Dec. 12, 1899.

668,206. Trolley-Switch. Eugene J. Parker, Worcester, Mass., assignor, by direct and mesne assignments, of seven-tenths to Alexander S. Paton, Leominster, Mass. Filed Nov. 16, 1899. Renewed Dec. 13, 1900.

668,453. Trolley-Head. Henry A. Nettleton, Manchester, Conn. Filed Dec. 20, 1900.

668,588. Trolley-Wheel. Chauncey R. McAdoo, Indiana, Pa. Filed Dec. 1, 1900.

668,581. Trolley-Wheel and Bearing. Orien P. Martin, Akron, O. Filed July 30, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

668,246. Electric Lighting Apparatus. Alexander J. Wurta, Pittsburg, Pa., assignor to George Westinghouse, same place. Filed Aug. 19, 1899.

668,345. Electric-Arc Lamp. Thomas F. Barrett, Chicago, Ill., assignor of two-thirds to James P. Barrett and Fred C. Jones, same place. Filed Oct. 15, 1900.

668,446. Electric Light for Show-Windows. Sig Hirsh, New Haven, Conn. Filed Oct. 10, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

668,194. Rotary Field-Magnet for Electrical Machines. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed July 14, 1900.

668,235. Rheostat. Nathan H. Suren, Needham, Mass. Filed June 29, 1899.

668,260. Electrical Measuring Instrument. Karl Lehner, Frankfurt-on-the-Main, Germany. Filed Feb. 16, 1899.

668,389. Electric Switch. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, New York City. Filed Nov. 23, 1899.

668,426. Testing Apparatus for Electric Circuits. Nathan H. Suren, Needham, Mass. Filed June 24, 1899.

668,440. Synchronizing Apparatus for Alternating-Current Generators. Herbert W. York, New York City, Filed May 11, 1900.

668,554. Electrical Relay and Circuit. Albert M. Bullard, Somerville, and Louis A. Falk, Boston, Mass., assignors to the American Bell Telephone Company, Boston, Mass. Filed Dec. 3, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

668,472. Holder for Telephone-Receivers. Horace M. York, Kennebunk, Me. Filed April 30, 1900.

MISCELLANEOUS.

668,215. Galvanic-Battery Electrode. Charles J. Reed, Philadelphia, Pa. Filed Sept. 14, 1897.

668,257. Electromagnet. George L. Foote, Brooklyn, N. Y. Filed Oct. 19, 1900.

668,282. Amalgamator. Caleb G. Collins, Woodmere, N. Y., assignor to Calvin Amory Stevens, New York City. Filed Jan. 4, 1899.

668,283. Amalgamation of Ores. Caleb G. Collins, Woodmere, N. Y., assignor to Calvin Amory Stevens, New York City. Filed Jan. 13, 1900.

668,284. Separator for Batteries. Leslie W. Collins, Chicago, Ill., assignor to the Collins Storage Battery Company, same place. Original application filed July 7, 1899. Divided and this application filed Feb. 9, 1900.

668,295. Storage-Battery Plate. Harry M. N. Muhle, Dayton, O. Filed Oct. 22, 1900.

668,300. Insulating-Support for Electrical Conductors. Henry E. Waite, San Francisco, Cal. Filed Nov. 16, 1900.

668,315. Receiver for Electrical Oscillations. Guglielmo Marconi, London, Eng., assignor to Marconi's Wireless Telegraph Company, Limited, same place. Filed July 17, 1900.

668,356. Electrical Accumulator-Battery. Paul E. Placet, Paris, France. Filed Nov. 14, 1899.

668,359. Electric Battery Contact. Arthur L. Stevens, New York City. Filed July 26, 1900.

668,429. Synchronizing System for Alternating Current Generators. Herbert W. York, New York City, Filed June 16, 1899.

668,488. Elevator Signal System. Martin H. Collum, Denver, Col. Filed April 9, 1900.

668,517. Storage-Battery Plate. John Hewitt, Chicago, Ill., assignor to the Hewitt Lindstrom Motor Company, same place. Filed June 12, 1900.

THE TELEPHONE WORLD.

Prof. Pupin's Cable Telephone System.

The first practical use of Prof. Pupin's cable telephone system will probably be in the establishment of direct long-distance connection with Cuba by the American Telephone & Telegraph Company, otherwise the Bell. The first move in this direction is through the Southern Bell Telephone Company, and again there is considerable speculation as to the relations between the Western Union and Bell interests.

Indications are not lacking that both are working to a common end in the South, and if this be true the Western Union must have been in some manner pacified for the loss it will suffer as a result of direct telephone connection with Cuba.

The Southern Bell Telephone Company is owned by the Western Union and the American Telephone & Telegraph Company. It has planned extensive developments to discourage independent competition in Virginia, Georgia, Alabama and Florida. The Southern Bell Company operates more than seventy exchanges, and now proposes to connect all feasible points with the long distance service and in-trench itself in Florida. Its expansion to the peninsula is understood to be part of the scheme to form connection with Cuba.

News from Chester, Pa., states that the Delaware & Atlantic Telephone & Telegraph Company, is getting ready to make a number of important improvements to both its local and long-distance service. It has just completed and added to its already large number of trunk lines, three more trunks, one each to West Chester, Coatesville and Newtown Square direct. This company has now twenty-seven direct trunk lines—ten to Philadelphia, three to Media, seven to Wilmington, two to Ridley Park and Darby, one to West Chester, one to Coatesville, one to Newtown Square, one to Claymont and Linwood and one to Moore. With all these trunk lines running to these important centers, and there connecting to all points of the United States, the citizens of Chester are promised superior and rapid long-distance telephone facilities. The local service of this company is also undergoing a number of changes. H. P. Ettlinger is the manager.

The citizens and business men of Gann Valley, S. D., the county seat of Buffalo County, are exerting their every effort at the present time toward the establishment of telephone communication with the outer world. Gann Valley's nearest railroad point is Kimball, twenty-two miles away, and the only means of communication is by stage. The business men are alive to the fact that by this condition of affairs Gann Valley and Buffalo County are losing trade and settlers. In the event of not securing a satisfactory proposition the citizens announce their intention of clubbing together and building a line to Kimball themselves.

The United Telephone & Telegraph Company of Philadelphia, Pa., has secured a controlling interest in the stock of the Independent Telephone Company, a Lancaster County concern, that was formed in opposition to the Pennsylvania Telephone Company. The deal involves stock worth \$210,000. The Independent Company was originally capitalized at \$150,000, but a month ago the capital stock was increased to \$300,000. The company has paid 5 per cent. dividends and has a surplus.

A stock company was formed at Hazard, Ky., a short time ago for the purpose of building a telephone line from Hazard to Jackson. The officers elected are as follows: President, B. J. Wootton; secretary, F. J. Eversole; treasurer, J. C. Boggs; general manager, C. X. Bowling. The company is known as the Jackson-Hazard Telephone Company, and it will erect lines to other mountain towns as soon as it completes the line from Hazard to Jackson.

The telephone company is advertising its goods in Portsmouth, N. H., by installing telephones that may be used until July free of charge for local calls. After July, if a continuance of the service be desired, the users will pay the usual rental. If not, the telephones are removed. Manager Wadsworth says that the scheme has not yet been introduced there this year.

The use of the telephone in Cairo and Alexandria, Egypt, has grown to such proportions that it has been found necessary to connect the two cities by a telephone trunk line.

The new telephone system in Scotland, S. D., is completed. It is proving a great success and will pay running expenses from the start.

The Interstate Telephone Company is stringing wires from Norristown to Newtown, Pa., where connections are to be made with the system of the Standard Telephone Company.

Telephone Expansion.

The following-named American telephone and telegraph subsidiary companies recently have increased their capital stock or are about to do so: The Rocky Mountain Bell Telephone Company, operating thirty-two exchanges in Utah and Montana, has increased its capital stock from \$842,000 to \$2,500,000 for improvements. The new stock will be issued as funds are required. The Central District & Printing Telegraph Company of Pittsburgh has voted to increase its capital stock from \$4,000,000 to \$7,500,000 for further development of its territory. This stock is listed on the Boston Stock Exchange. The Hudson River Telephone Company, operating in Albany, Poughkeepsie, Saratoga and other points in Northern and Eastern New York, will increase its capital stock from \$3,000,000 to \$4,000,000 for construction purposes. The capital stock was increased \$1,000,000 last March. The Chesapeake & Potomac Telephone Company, operating in Washington, D. C., and the State of Maryland, has made an additional issue of \$750,000 5 per cent. bonds, making the total issue to date \$1,250,000. The total authorized issue is \$1,500,000. At the time of the consolidation of the several subsidiary telephone organizations making up the New England Telephone Company in 1893, \$4,068,400 stock was issued to the American Bell Telephone Company for franchises, etc., and \$5,842,800 to other stockholders, making a total capital of \$9,911,200. Up to March 31, 1900, the capital has been increased for extensions and development to \$13,759,100, and bonds and debts created amounting to \$4,387,800. Add the probable cost of new extensions in 1900, estimated at \$2,000,000, and the total amount of capital employed to day will be \$20,146,900.

Reports of marked progress were the features of the annual meeting of the Providence Telephone Company held recently. Authority was given the board of directors to increase the capital stock from its present figures of \$1,200,000 to an amount not exceeding \$1,600,000. The growth during the past year has been the largest ever known, with a gain of nearly 1,200 new stations. There has been a marked gain in construction, including much underground work. Two new exchanges are now in process of construction, one in Attleboro and the other to be known as the Elwood Exchange in Providence. The following will hold office during the coming year: President, Dexter B. Potter; vice president, Fenner H. Peckham; secretary and treasurer, Charles T. Howard; general manager, Albert C. White; assistant general manager, Joseph F. Beck.

The Home Telephone Company of Findlay, O., has inaugurated an innovation in the matter of interurban lines. The company has secured a franchise for an exchange at Benton Ridge, a village ten miles west of there, and will make that a sub exchange to the Findlay office. In other words, the Benton exchange will be an integral part of the Findlay exchange and interurban communication may be enjoyed by patrons of the company with no additional charge. The company is also placing a large number of instruments in farmers' residences throughout Hancock County.

The Central Union Company of Noblesville, Ind., announced lately that it would give free communication to its subscribers with every town in Hamilton County, and it offers the same privilege to farmers having 'phones placed in their homes. A rate of 50 cents per month has been established for residences and a 10 cent rate between Noblesville and Indianapolis. Other reductions are proposed. The other companies in Hamilton County will likely meet the competition, although they have not yet taken action in the matter. This cutting on the part of the Central Union is thought to be due to the fact that the new company, which recently established a plant in Noblesville, is getting the bulk of the business.

The Butler exchange of the Ohio Telephone Company was recently sold at constable sale to the Central Union for \$200. Dissatisfaction among the stockholders caused the sale to be made.

The charter of the Stantonville Telephone Company of McNairy County, Tenn., was recently amended so as to increase the capital stock to \$2,000.

The American Telephone Company of St. Louis, Mo., has entered Western Kentucky and will branch out among the prosperous towns of that section.

The Gallipolis, O., Telephone Company has increased its capital stock from \$30,000 to \$50,000.

The Sunset Telephone Company is completing a \$15,000 three story telephone building in Tacoma, Wash. It will be ready for use in April.

To Telephone from Ocean to Ocean.

It is announced in Tacoma, Wash., that within a year, in all probability, one will be able to telephone from Puget Sound clear across the country to Chicago and New York. It is believed that next summer will see made a practical test of telephoning from Tacoma to New York. The route westward from New York will be to Chicago, Kansas City and Denver, thence to Salt Lake, Butte City, Spokane and Tacoma.

During the coming summer the Rocky Mountain Bell Telephone Company will string a line from Big Timber to Billings, Mont., and later to Miles City. Another line will be built from Butte to Bozeman. The Northwestern Telephone Company of Minneapolis now has a line working as far westward as Bismarck. But a comparatively small gap will thus be left between Miles City and Bismarck. By the time this gap is filled the Montana cities will be connected with Spokane, Wash., and the ocean-to-ocean telephone line will then be complete.

The Queen City Telephone Company, an independent line, which has been the rival of the Bell Company for a number of years in Charlotte, N. C., has gone into the hands of a receiver, Dr. J. F. Robertson being named; as receiver. The plant will be sold on March 18. Until that date it will be operated by the receiver. It is thought that the plant will find a purchaser and be continued on even a more satisfactory basis than before. The outstanding claims against the company caused the stockholders at their last meeting to take steps which resulted in the receivership. Capt. J. H. Wiley, of Salisbury, N. C., is president of the Queen City Telephone Company, and J. H. Helvin general manager.

The Independent Telephone Association of the State of Wisconsin ended its third annual meeting in Madison a short time ago. The following officers were elected: President, A. L. Hutchinson, of Weyauwega; vice-president, C. P. Schweizer, of La Crosse; secretary and treasurer, H. C. Winter, of Madison; executive committee, Richard Valentine of Janesville, F. H. Sweet of Fond du Lac, J. C. Harper of Madison, J. A. Gaynor of Grand Rapids, W. F. Gunaer of Appleton. It was decided to hold an adjourned meeting at La Crosse in June, and the next annual meeting in Milwaukee in February.

At the recent annual meeting of the Central New York Telephone & Telegraph Company held in Utica, N. Y., C. J. French of Boston, Martin A. Knapp of Syracuse, Lewis H. Lawrence, Charles A. Nicholson, Frederick T. Proctor, Charles B. Rogers, Joseph Rudd and Francis G. Wood of Utica and Jeffries Wyman of Boston were elected directors. Lewis H. Lawrence was chosen president, Joseph Rudd, first vice-president and Jeffries Wyman second vice-president for the ensuing year.

The Reusselaer, N. Y., Telephone & Telegraph Company, with a capital of \$150,000, with a privilege of increasing it to \$500,000, has been formed to operate in Troy, Watervliet, Green Island, Waterford, Cohoes and Schenectady. The directors are John H. Gleason, Edward F. Murray, John J. Smith, E. E. Summey, Charles Maloney, Joseph H. Broder, fck, Joseph H. McCarthy, W. H. Hollister and Thomas J. Mooney.

The Bell Telephone Company is assuming the contracts of the New State Telephone Company in Mt. Clemens, Mich., and it is quite likely that the New State office will shortly be done away with and all 'phones connected with the Bell Company's board. Those who keep New State contracts will not be given Bell connections.

The Hanover, Pa., Telephone Company has sold the franchise and plant of the company to Samuel L. Johns, of McSherrystown, Pa., acting in the interest of T. J. O'Neill, of Hanover, under whose management the business will hereafter be conducted.

Stockton, N. Y., is to have a new telephone system. The stockholders are chiefly residents of that village.

TELEPHONE INCORPORATIONS.

The Tri-County Telephone Company, Greenwich, O. Capital stock, \$25,000.

GENERAL ELECTRICAL NEWS.

Lighting.

Centerville, Ala.—There is a prospect of having waterworks and an electric light plant here. The matter is being discussed, and ex-Sheriff Robert Vance says he will put a plant in at once.

Clarence, Mo.—Clarence will soon vote on the electric light proposition.

Coushatta, La.—There is a movement on foot to establish an electric light plant here in the near future. Frank Pierson is interested in the scheme.

Dodge, Neb.—F. J. Erb is contemplating putting in an electric light plant here.

Dublin, Ga.—This city will determine March 12 an issue of \$25,000 of bonds for enlarging the electric light plant.

Dundee, Ill.—The question of electric lighting for West Dundee will be submitted to the voters at the coming spring election.

Elberton, Ga.—The establishment of a municipal electric light plant is being considered.

Franklin, Ind.—A franchise has been granted here to a Chicago capitalist for an electric light plant.

Fulton, N. Y.—A new company will soon try to get the franchise for lighting the streets of this place.

Hiram, O.—The streets of this place are to be lighted by electricity.

Homer, Ill.—The Homer Light & Power's Company's plant has been purchased by G. C. Bowen, who contemplates making extensive improvements.

Humeston, Ia.—The citizens are agitating the electric light question.

Huntingburg, Ind.—Messrs. W. and C. Miessner are preparing to purchase new machinery for the electric light plant.

Joliet, Ill.—Hamer H. Green of Bloomington, and a member of the Joliet Board of Penitentiary Commissioners, says that the waters of the Desplaines River would furnish light and power for the prison and save the State a vast sum spent for coal.

Kinsley, Kan.—The city council contemplates the erection of an electric light plant.

Lyons, N. Y.—Over \$10,000 will be expended by the Wayne County Electric Light & Power Company in new machinery at the Lyons plant. New machinery will also be installed at the Newark and Palmyra plants.

Macon, Ill.—J. F. Van Gundy will put in a complete electric light plant here.

Manchester, Vt.—There is said to be a good prospect that an electric light and power plant will be put in this place next spring. The power will be taken from Bourn pond, about nine miles back in the mountain. Ample power for the proposed electric railway from here to Granville, N. Y., will be obtainable. The capital will be furnished by out-of-town parties.

Midway, Ky.—The electric light question is being discussed here.

Northfield, Vt.—The Bolton Falls Power Company has submitted a proposition for the purchase of the Northfield electric light plant.

Odebolt, Ia.—An electric light company will soon be formed here with \$32,000 capital stock, and it proposes to erect an electric light plant.

Orange, Tex.—P. H. O'Day, manager of the Electric Light & Ice Works, has received orders to dispose of all of the dynamos and other electrical machinery now in use here, with a view of putting in a much larger system.

Peru, Neb.—J. A. Hays was lately granted a franchise to establish an electric light plant here.

Pomeroy, Wash.—At a recent meeting of the city council an ordinance was passed granting H. M. Thatcher an electric light and power franchise for five years.

Reinbeck, Ia.—The city council is discussing the electric light question.

Sharpsburg, Pa.—The city council has passed an ordinance providing for an election on April 4 on the matter of securing improvements in the borough electric light supply.

St. Joseph, Mich.—Business men of this place have

decided to build and donate to the city a \$15,000 electric lighting plant.

Somerville, Tenn.—This city will issue bonds for the erection of an electric light plant.

Syracuse, N. Y.—Dr. J. L. Wente of Scranton, Pa., contemplates the erection of an electric light plant in this city.

White Pigeon, Mich.—The citizens are agitating the question of erecting a new electric light plant.

Winchester, Tenn.—This city is investigating the cost of constructing an electric light plant.

Street Railways.

Barnesville, O.—There is talk here of an electric line connecting this place with several towns of this vicinity, and it is said that Wheeling men are interested in the project.

Chicago, Ill.—Articles of incorporation were lately filed with the Secretary of State by C. E. Crafts for the Chicago & Desplaines Valley Electric Railway with \$1,000,000 capital stock.

Cortland, N. Y.—The Cortland & Homer Traction Company, using electricity for its motive power, is to be further extended to Glen Haven where it will connect with the Skaneateles & Auburn trolley road. A consolidation of the two is contemplated, and the first-named road will increase its capital and issue additional bonds. Particulars may be had of the secretary and general manager, H. B. Westcott, 24 Main street, Cortland, N. Y.

Creston, Ia.—This city, Winterset and Macksburg, have united in a movement to give Creston an electric line connecting the points mentioned.

Cumberland, Md.—The Penn State Construction Company of Philadelphia has been granted a franchise by the county commissioners to build an electric line from here to Western Port, a distance of 30 miles. The cost is estimated at \$500,000.

Detroit, Mich.—The Wyandotte & Detroit River Electric Railroad, running from this city to Trenton, a distance of nine miles, was purchased last week from J. C. Hutchins, of Detroit; A. B. Dupont, of St. Louis, and the other owners by the Detroit United Railway.

Durham, N. C.—R. H. Wright is president of the Durham Traction Company that will build an electric car line here.

Elmwood, R. I.—A recent fire in the car sheds of the Union Railroad here destroyed one of the buildings and gutted another. Thirty trolley cars were burned valued at \$97,000. The total loss will reach \$102,000, covered by insurance.

Hodgenville, Ky.—Dr. J. C. Jones, of Buffalo, is making an effort to organize a stock company for the purpose of building an electric car line between this place and Buffalo. The distance is six miles.

Independence, Kan.—The county commissioners have granted a franchise to G. T. Guernsey, T. H. Stanford and I. B. Wallace of this city for an electric railway between here and Cherryvale, a distance of nine miles. The road will cost \$150,000.

Milwaukee, Wis.—The Milwaukee, Burlington & Lake Geneva Railway Company has filed articles of incorporation. It is an electric line to carry freight and passengers. The capital stock as now filed is \$100,000, but this will be increased two or three millions if the plan goes through.

New York City.—George H. Pegram, chief engineer for the Manhattan Railway Company, filed plans last week for a new two and three story brick station to be used for storing and distributing electric power for the new third-rail system with which the road is being equipped.

New Haven, Conn.—Fire recently destroyed the power house of the Winchester Avenue Electric Railroad Company.

Pine Bluff, Ark.—W. H. Langford is interested in a company to build an electric line in this place.

Savannah, Ga.—The Savannah Street Railway Company is considering the building of an electric line to

Montgomery. L. H. McIntire is manager of the company.

Spearfish, S. D.—An electric line from here to the mining camps is being discussed. It is rumored that Lead has subscribed \$75,000 toward such an enterprise and this city is to put up \$60,000.

Stroudsburg, Pa.—The chances for the changing of the Stroudsburg Passenger Railway power from steam to electricity are good.

Tiffin, O.—The Toledo, Tiffin & Sandusky Electric Railway will be built from here to Fremont early in the spring. Judge J. I. Bunn of this city is one of the directors of the company.

Manufacturing.

Cleveland, O.—The Van Dorn-Elliott Electric Company was formed a short time ago with \$50,000 capital to manufacture electric apparatus. J. H. Van Dorn, H. H. Hodel, F. Schneider, W. A. Dutton and W. H. Elliott are interested in the enterprise.

Fairfax, Va.—The Southern Incandescent Lighting Company, of which J. P. Machen is secretary, wants to correspond with manufacturers of incandescent lamps.

New York City.—George Stein, W. V. Langlos and C. F. Kabisch of this city are all interested in the recently formed company, known as the Stein & Langlos Electric Manufacturing Company, and capitalized at \$10,000.

Peabody, Mass.—The American Aaron Meter Company of this place will install new machinery and manufacture electric meters.

Trenton, N. J.—The Stanley Electric Manufacturing Company held its recent annual election of officers at the office of the John A. Roebbling's Sons Company. The following officers were elected for the ensuing year. Dr. F. A. C. Perrine, president; W. W. Gamwell, treasurer, and W. Taylor, secretary.

Watsonville, Pa.—The American Electric Appliance Company, which operates a plant here, has leased the plant of the Marcus Hook Iron Works, and will manufacture engines and dynamos.

Company Matters.

Cincinnati, O.—The Jones Brothers' Electric Company has just increased its capital stock from \$164,000 to \$400,000.

Power and Transmission.

Salt Lake City, Utah.—A petition was recently presented to the county commissioners by L. L. Nunn, the chief stockholder and authorized representative of the Telluride Electric Power Company of Provo and the Hercules Electric Power Company of Logan, requesting a franchise for constructing and operating an electrical transmission line of poles and wires over the highways in Salt Lake County.

Automobiles.

Champaign, Ill.—The Illinois Motor Transit Company with a capital of \$50,000 has been formed to operate automobiles. John Armstrong, John T. Ainsworth and S. D. Enoch are back of the enterprise.

Cincinnati, O.—A company in which Emmett P. Gray, Otto Armleder, Albert Leisure, Benjamin A. Wright and S. A. Ramsey are interested will equip a plant and begin the manufacture of automobiles at once.

Faribault, Minn.—The Chicago Electric Vehicle Company of this city now manufactures every part of its electric vehicles, including the batteries, at its factory here.

New Haven, Conn.—Senator Kennedy has introduced a bill incorporating the Truck Automobile Company of New Haven with a capital stock of \$1,000,000 for the purpose of carrying on a general trucking business by automobiles.

Springfield, O.—L. P. Brenning, formerly of Salem, Mass., has commenced the manufacture of automobiles in this city.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16% @ 16% c.; Lake, 16% @ 17% c.; casting, 16% @ 16% c.

The Cincinnati Traction Company has been chartered, with a capital of \$2,000,000, to lease the Cincinnati Street Railway.

Coupons due March 1, 1901, from the first mortgage five per cent. gold bonds of the United Traction and Electric Company, Providence and Pawtucket issue, will be paid on and after March 1, 1901, on presentation at the office of the Central Trust Company of New York.

Cleveland advices state that the earnings of the National Carbon Company for last year are in the neighborhood of 5 per cent. on the common stock. The recent buying of the stock is said to be speculation on prospect of a dividend. The improvements made on the property last year are said to have been few and only a small amount will be charged off for depreciation.

The Cincinnati street railway system, its franchises, rolling stock and all other rights and equipment have passed into the hands of the Widener-Elkins syndicate.

Chief Engineer Parsons of the Rapid Transit Commission of New York announced Tuesday that the underground railroad will be finished before the expiration of the time granted to Contractor McDonald. The work has been progressing so favorably, Mr. Parsons said, that at the latest by Christmas of 1903 trains will be run from the City Hall to the northern limits of the city.

Traffic on the Metropolitan Elevated Railroad of Chicago thus far this month exceeds that of the corresponding period last year, when the average daily travel was 92,618 passengers. March has always been the heaviest month of the year under normal conditions, and traffic seems growing up to a good showing for that month. Last year, the March showing averaged 94,508 passengers daily.

The stockholders of the Columbus Edison Company are offered the right to subscribe for 6% per cent. of additional preferred stock at par. Payment must be made in an installment of 10 per cent. April 1, 30 per cent. July 1, 30 per cent. September 1 and 30 per cent. November 1. The proceeds of the sale, \$47,000, are to be used in enlarging the company's stations. The rights are to stockholders of record March 1 and expire March 15.

The value of the stock, which the Royal Electric Company, of Montreal, received from the Canadian General Electric Company, of Toronto, for the manufacturing plant of the former company in Montreal, is to-day placed at \$612,000. The transfer of the plant took place some time ago, but the inventory has not yet been definitely decided. Mr. Rodolphe Forget, president of the Royal Electric Company, states that the original amount involved would be about \$480,000.

The annual meeting of the Canadian General Electric Company, of Toronto, Ont., was held on February 20. The report showed that the net profits, on operating accounts, amounted to \$262,903, and the premiums on the new stock to \$75,000. These items, with the \$58,437, balance from last year, make a total of \$396,340. The dividends, 10 per cent. on the common stock and 6 per cent. on the preferred stock, amounted to \$127,623; \$125,000 has been added to the reserve, making that fund now \$365,000, and a further sum of \$12,600 has been placed to the credit of profit and loss, making \$71,038 carried forward.

Chicago newspapers declare that the "deal" between Mr. Yerkes and the Ryan syndicate was closed last Friday in New York and that the individual holdings of Mr. Yerkes in the capital stock of the Lake Street, Northwestern and Union Elevated companies were transferred to new owners. The terms are not obtainable, but \$5,000,000 is regarded as a fair figure for the securities. From the best data at hand, it seems probable that Mr. Yerkes parted with about 25,000 shares each of Lake Street and Union Elevated stock and about 10,000 shares in Northwestern Elevated.

The Queen City Telephone Company was incorporated at Albany, N. Y., on Monday with a capital stock of \$500,000 to operate a telephone system in the city of Buffalo and connecting the following other cities: Easterly to Rochester, Syracuse, Utica, Albany, Poughkeepsie and New York; northeasterly to Tonawanda, Niagara Falls, Lockport, Oswego, Watertown and Ogdensburg; westerly to Dunkirk, Erie, Cleveland, Detroit, Toledo and Chicago, and southerly to Jamestown, Hornellsville, Binghamton, Corning, Elmira, Scranton, Wilkes-Barre, Philadelphia, Jersey City and Washington.

The "New York Daily Stockholder" says: "The report of the Brooklyn Heights Railroad Company, the largest slice of the Brooklyn Rapid Transit outfit, shows that for the December quarter gross earnings of \$2,883,681 were \$28,766, or just about 1 per cent. larger, than a year ago. The company succeeded in keeping expenses down \$77,608 and thus increasing net earnings \$106,374, but how much these indicate improvement in the surplus and foretell of early dividends on Brooklyn Rapid Transit stock may be gathered from the fact that the surplus was \$33,827, and showed an increase of \$16,775. It seems the most of the gain in net earnings was made away with before the last line in the statement could be reached, fixed charges sandbagged it to the extent of \$90,905, and it was helped by only \$1,306 increase in other net income."

At a special meeting in Pittsburg on February 20 of the stockholders of the Westinghouse Electric and Manufacturing Company, it was voted to increase the capital stock by \$10,000,000, designating the new stock as second preferred or as-senting. The present capital stock is \$15,000,000. Of this increase, \$3,000,000 will be issued at once and will be offered to stockholders at not less than par, as the directors may decide. The remaining \$7,000,000 will be issued as necessity demands, at not less than par. At the meeting it was announced that the proceeds of the sale of the \$3,000,000 new stock are to be used for working capital and extensions. The earnings of the company for the year ending March 31, 1900, were approximately \$12,000,000, or \$7,500,000 more than for the year ending March 31, 1899. The surplus account on December 31, 1900, stood at \$4,700,000 after \$2,700,000 had been written off for depreciation.

EDITORIAL NOTES.

The Berliner Patent.

Elsewhere in this issue
will be found in detail
the account of the Ber-
liner patent decision as
handed down in Boston on February 27 by Judge
Brown, in the suit of the American Bell Tele-
phone Company vs. the National Telephone
Manufacturing Company. The patent over
which the suit was fought was issued to Emile
Berliner on November 17, 1891, after the lapse
of fourteen years, five months and thirteen
days from the date of the application. The
whole explanation of this was that the Bell
Company delayed the taking out of this pat-
ent until a time best suited to its interests. As
the original Bell patents covering the receiver
were to expire on March 7, 1893, the Bell Com-
pany caused the Berliner patent in question to
be issued, with a view to securing a monopoly
of the business for an additional period of
fifteen years.

This action as is well known led to a consid-
erable amount of litigation some years ago be-
tween the United States and the Bell Com-
pany, in which it was decided that the Ber-
liner patents were valid. The patents were
sufficiently broad to cover all telephones in
commercial use, and through them the Bell
Company claimed exclusive right to manufac-
ture all forms of contact transmitters and
microphone receivers. If this claim had been
sustained by Judge Brown, it would be impos-
sible for any other concern to manufacture or
use the commercial telephone as it is to-day.
This would have meant the downfall of the
independent telephone movement, which has
done so much to lower rates and furnish good
service through healthy competition.

The American Bell Telephone Company has
made a vigorous fight to gain its end, and as
a natural result the decision in favor of the
independent company, is regarded by officials
of the monopoly as a severe blow.

Now the field is open to any company that
may desire to use the microphone. There is no
doubt but that the American Bell Telephone
Company will take the case to the United
States Supreme Court, but independent tele-
phone company officials feel so confident that
Judge Brown's decision will there be upheld,
that they intend proceeding on those lines.
The decision furthermore cannot help but
strengthen the independent movement, as

capital that has heretofore been withheld from
investment in telephone enterprises, owing to
the uncertainty of the validity of the Ber-
liner patent, will now unquestionably be forth-
coming. Referring to the decision rendered
W. H. Eckert, president of the Knickerbocker
Telephone and Telegraph Company, is reported
as saying:

"This decision rendered by Judge Brown,
in which he declares the Berliner transmitter
patent void, will be far reaching in its effects.
It has been the plan of the American Bell
Telephone Company and its licensed com-
panies to give the impression that the life of
independent telephone companies would be
short in view of the Berliner patent. Of
course the Bell telephone interests have made
strenuous efforts to forestall competition.
These efforts have, in many cases, been so
successful that difficulty has been experienced
in financing new telephone enterprises.

"In the middle West, however, the inde-
pendents have proceeded regardless of the
fate of the Berliner patent, but in the East,
where Bell Telephone securities are princi-
pally held, independent telephone enterprises
have not been so numerous as in the middle
West. In view of this there can be no doubt
whatever that the decision of Judge Brown
will remove all distrust on the part of pros-
pective investors and users of independent
telephones.

"This decision in the Berliner case will give
impetus to the Knickerbocker Telephone and
Telegraph Company. Although this company
has been constructing its plant for some little
time, there is no doubt but that its construc-
tion will proceed with renewed vigor from this
time on. It is hoped that the subscribers to
the system of the Knickerbocker Company
will be of such numbers as to compare favor-
ably with the independent telephone situa-
tion in other localities.

"In Ohio, for instance, although there is no
independent telephone system in Cincinnati,
Toledo and Dayton, there are far more subscrib-
ers to the independent telephone companies
in that State than to the Bell system. The
same is the case in other States, and we
hope that a like condition of affairs will be
found in New York City and other important
points in the East in the near future. In a
word, the independent telephone situation has
been wonderfully improved by Judge Brown's
decision."

That the decision recently rendered is a just

one will be apparent to anyone who has studied the matter carefully. The independent companies have just cause for rejoicing, and it is to be hoped that through the untiring efforts of such men as Judge Thomas, G. W. Beers and others the independent movement may grow to mammoth proportions during the next year or two.

* * *

A Proposed Method of Voting by Electricity.

It seems not unlikely that within a comparatively short space of time electricity will play an important part in the accomplishment of National legislation. A movement is now on foot to have designed and placed in the House of Representatives at Washington a device enabling Representatives to vote and have their votes recorded, counted and displayed through the agency of the electric current.

Such a device would not only insure absolute accuracy but save a vast amount of time, which is money in this particular instance. Every time a roll call is demanded and proceeded with in the House it costs the people of the United States approximately \$4,000 during a short session of Congress. The gross expense of maintaining the House of Representatives is about \$3,000,000 per annum. Counting one hundred days in a short session (there are actually but ninety) the expense amounts to \$30,000 per day of not more than five hours length, or \$6,000 per hour. The time consumed in a roll call is about forty-five minutes. It is estimated that but three minutes' time would be required to call the roll under the proposed electrical system, a net saving of at least forty minutes' time.

During the early part of the recent session a bill was introduced in the House by Representative Otey for the erection of the electrical device or appliance in the rear of the Speaker's desk and facing the main entrance, to be connected with each member's desk, so that he would be enabled to touch a button and show the record of his vote by a small incandescent light. After the presentation of the bill Mr. Otey laid the matter before the acting architect of the Capitol, Mr. Elliott Woods, in order to obtain from him suggestions as to what would be the best method of attaining the desired end, namely, saving of time, over the present method of recording a vote. Mr. Woods calls attention to what he considers to be three essential features to make such a device a working success: first, the names of the members should be visible from every part of the House, as well as their vote; second, there should be a duplicate device placed in such a position that it would be in front of the tally clerk; third, the device should be so arranged that it would place upon record on paper the result of the vote, so that it could become a part of the Record.

It is suggested that the principal device should consist of a large board, placed so that it would be well above the Speaker and in full view of the members, this board to be so divided that there will be an equal number of spaces as there are members; the name of the member to be shown in black on white porcelain glass. At the right of the name would be two small spaces, one to register the "aye" and the other the "nay" vote. The duplicate would be a miniature representation of the first and could be placed under a sheet of plate

glass in the top of the tally clerk's desk. At the right of this tally device would be arranged an automatic punching and adding machine to record the vote.

The other end of the device would be a set of two buttons, to be placed in each member's desk, to record the vote, and a third button and a corresponding space are suggested in order that there might be a record of "present, not voting." As a separate wire would run from each member's desk to the three boards, the vote of the entire House might be made instantaneously provided each member pressed his button at the same moment.

To perfect such a device would take some time, as it is entirely new in idea, and would require original work along untried lines, always more expensive than any work on established principles. It is thought that the cost might be anywhere from \$10,000 to \$15,000. It is suggested that such a device would completely revolutionize methods of procedure in the House.

* * *

High Speed Electric Roads for Germany.

Efforts have been and are constantly being made to increase the rate of speed of travel. Twenty years ago a steam locomotive that could reel off fifty miles an hour was considered a wonder, while now we have engines that run sixty and even seventy miles an hour without anything being thought of it. But with the present form of steam locomotive the limit of speed would seem to have been reached, and for this reason inventors and engineers have turned their attention to electricity as the propelling power. In the near past various forms of high speed electric railways have been suggested, probably the most practicable being that designed by Mr. Behr in England, and referred to at various times in these columns. Germany would now seem to be examining into this matter, and in a recent communication to the State Department, Mr. Guenther, United States Consul General in Frankfurt, refers to the subject at considerable length. It is Germany's ambition, so it seems, to be first in the field with the ideal railway of the future. At a recent audience in Berlin Privy Councillor Rathenau, a promoter of great electrical enterprises, gave Emperor William considerable information, and especially emphasized the necessity of constructing electrical railways for direct and rapid connection between Berlin and the principal cities of the empire. He also brought out the fact that a great national triumph would be gained if Germany could be the leader in the creation of an entire electrical railway system.

The German Secretary of War has placed the military line from Berlin to Zossen at the disposal of electrical promoters, who are urging upon the Government this mode of travel for experimental purposes. This line is 18 miles in length, and it is hoped that a speed of from 125 to 155 miles an hour can be attained. The cars will each accommodate fifty passengers, and will look very much like the sleeping cars now in use. If the trial runs prove satisfactory a great step toward the utilization of electricity as the sole railway motive power will have been gained, and, says the Consul General "the time will not be distant when it will be possible to travel, for example, from Berlin to Hamburg in a little over an hour, in

cars which will follow each other at intervals of ten minutes."

The day will no doubt come when persons can be transported from one point to another at the rate of 150 miles an hour, but we think our German friends are a little too optimistic and that the speed talked of is not yet in sight.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

A DISPATCH from Schenectady says that J. P. Ord has resigned the second vice-presidency of the General Electric Company for the purpose, it is understood, of becoming the head financial man of the United States Steel Corporation.

THE inventory of the estate of Bernard M. Shanley, the trolley magnate, who died last March, filed with Surrogate Eller of Newark, N. J., shows a total valuation of nearly \$7,000,000.

AN American company has negotiated the purchase of the Manila Street Railway, which it proposes to convert to the electric system.

A YOUNG inventor of Bridgeport, Conn., has recently patented a new fuse box which, it is claimed, will prevent exposed charged wires from igniting inflammable material, with which they might come in contact, and will also prevent the breaking of a circuit by the burning out of a fuse box by overcharged wires.

A BILL has been introduced in the Illinois Legislature to abolish hanging and establishing electrical execution as the legal mode of inflicting the death penalty.

ACCORDING to a daily paper one million dollars is to be expended in a system of sanitariums for the cure of consumption, by electricity and Cleveland, O., men will see the project through in a financial way. The sanitariums are to be placed in some of the largest cities in the United States and Canada.

THE Shah of Persia had an agent in this country a short time ago making an investigation of our trolley lines, and it is now stated that an electric line is to be run for about a hundred miles from Teheran to a port on the Caspian Sea.

THE White Star Line within a few weeks will replace the steam winches for hoisting cargo and gang planks on its piers with electric windlasses. Bruce Ismay, the head of the company, recently signed a contract for the installation of the electric plant. It is said that other lines will follow the example of the White Star.

THE State Department at Washington has been informed by Consul Fee at Bombay in a recent report that a steamer, plying directly from New York City, has arrived with an electric plant and outfit and party of engineers and electricians. The party represents a New York firm, and is destined for the Kolar Gold Fields, near Bangalore, the capital of the native State of Mysore. The power necessary to operate this electric plant is to be furnished by the Cauvery River, which will be conducted across the country to the gold fields.

The erection of this plant will, it is expected, increase the production of the mines and reduce the expense of working. It is a new feature in gold mining in India.

THE Automobile Club of New England recently opened new quarters in Brookline, Mass. There were electric, gasoline and steam vehicles, making altogether as fine a collection as could be shown by any American automobile club. The arrangement of the stables was left to Messrs. Knight, Nefell and Howard, and they already have in place a generator for the recharging of electrical machines, and a special arrangement for the refilling of the boilers of steam vehicles.

ACCORDING to the "Electrical Engineer," London, the Allgemeine Elektrizitäts-Gesellschaft has introduced a new meter for recording the number of hours during which a lamp or group of lamps connected to either of its circuits may burn. The meter is intended for use principally in connection with small installations, where the provision of a watt-hour meter would be relatively extravagant. The meter is constructed for three or five circuits, the recording systems in connection with which are served by clockwork in such a manner that the time during which a circuit may be switched in is recorded independently. The central system of clockwork common to the several recorders is arranged to work at a certain uniform speed for a total of 250 hours. This clockwork actuates a driving wheel, with which are arranged concentrically the wheels connecting the respective circuit recorders. The action of switching in a circuit serves at the same time to couple up its respective recording system with the common driving wheel. When all the circuits are switched out the clockwork stops automatically, but the switching in of a single lamp or circuit suffices to again set it in motion, and simultaneously the recorder belonging to the circuit.

THE first sheets of the Pan-American Exposition stamps, which the Bureau of Engraving and Printing at Washington, D.C., has been at work on for the past four months, have recently been finished. They are of the value of two cents, and bear the picture of a railroad train. The design in the one-cent stamp will show a steamer representing lake navigation; the four-cent stamp will show an automobile in the foreground with the Capitol at Washington in the background; the five-cent stamp will contain in its center a picture of Niagara Falls; the eight-cent stamp a picture of the great canal locks at Sault Ste. Marie, while the ten-cent stamp will show an ocean liner. The center design in all the stamps will be in black ink, while the border will be the color of the current series of stamps, and bear the inscription, "Commemorative Series, 1901." The pictures are one-third by one-half an inch in size.

A SUCCESSFUL test of a printing telegraph machine, was recently made on a loop line between Omaha and Kansas City, representing 434 miles of wire, added to which was resistance representing 120 miles of wire, making a total of 554 miles. The sender of the apparatus resembles the keyboard of a typewriter. As the operator manipulates the keyboard the message is transmitted and automatically printed on a roll of paper by the receiver. Any person who can operate a typewriter is capable of

sending a message. The receiving is automatic, the only attention required being to supply rolls of paper when needed and keep the receiver in working order. Each letter is made by a certain motion of one of nine fingers, each finger being susceptible to four motions from as many grades of current, supplied by storage batteries at either end of the line. Thus 36 separate motions are obtained, one for each letter of the alphabet, eight for the figures not contained in the letters of the alphabet, one for the period and one for the spacing. In the test made, an electromotive force of 24 volts was used at first, but was increased to 85 volts when messages were sent at full speed.

Scientists and physicians throughout Europe are interested in a discovery made by Dr. Ottolenghi, Professor of Medical Jurisprudence at the University of Siena. While experimenting with Roentgen rays Dr. Ottolenghi thought that it might be possible to use them effectively for the purpose of ascertaining whether a person was actually dead or simply in a trance, and he at once determined to make the test. He discovered that while it was easy to apply the rays to the lungs of a person who was alive or in a trance it was extremely difficult—indeed, practically impossible—to apply them to the lungs of a person actually dead. The reason was that some intervening obstacle prevented the rays from penetrating into the body. Over and over again he made a test of this kind and in each case the result was the same. He suggests that as this test can easily be made by any physician it should in future be employed in all cases where doubt exists of death.

AMERICAN STREET RAILWAY ASSOCIATION.

All Arrangements Perfected for Holding the Annual Meeting in New York.

The Executive Committee of the American Street Railway Association met at the Murray Hill Hotel, New York, on February 28, to make arrangements for the twentieth annual meeting of the Association, which will be held in New York City. The following named members were present: President Walton H. Holmes, Kansas City; H. H. Vreeland, New York; N. H. Heft, Meriden; John B. McClary, Birmingham, Ala.; Frank L. Fuller, Philadelphia; G. W. Baumhoff, St. Louis; John R. Graham, Boston, and T. C. Penington, Chicago. It was decided to hold the meeting on Wednesday, Thursday and Friday, October 9, 10 and 11. There will be two sessions of the Convention on each of the first two days, and the last day will be set aside for the inspection of exhibits. The banquet will be held in the evening of the last day, when the newly-elected officers will be installed.

The Madison Square Garden has been leased from October 6 to 13, and it is expected that the exhibit of street railway appliances will be on a very large scale. The meetings of the Association will be held in the same building. Provision has also been made for the meetings at the same time of the Street Railway Accountants' Association of America. The usual charge of ten cents per square foot for space in the exhibit hall will be made.

A new departure has been determined upon in the matter of papers presented to the meeting. They are to be printed and advance

copies sent to the members. They will be read at the meeting by title only. The President was authorized to select a speaker to open the discussion on each paper, and thirty minutes will be given to the consideration of each paper.

The following topics were selected, upon which papers are to be presented:

"Street Railways—A Review of the Past and a Forecast of the Future."

"The Adoption of Electric Signals on Suburban and Interurban Railways, Single or Double Track, and Their Economy of Operation."

"The Value of Storage Batteries as Auxiliaries to Power Plants."

"The Public, the Operator and the Company."

"The Best Manner and Mode of Conducting the Return Circuit to the Power House."

"The American Street Railway Association—The Purposes of its Organization and the Benefits Accruing to Investors in, and Operators of, Street Railway Properties by Membership Therein."

"The Economies Resulting from the Use of Four Motors Instead of Two on Double Motor Equipments."

"The Best Form of Car for City Service—A Consideration of the Various Types of Car as to Size of Car and Arrangement of Seats, Including the Best Types of Brakes and Wheels."

"Practical Results Obtained from Three-Phase Transmission and Rotary Transformers or Motor Generators in Transmitting Power on Railway Lines."

"Relations of Interurban and City Railways."

"The Modern Power House, Including the Use of Cooling Towers for Condensing Purposes."

The admission fee will be waived in the case of any company becoming a member of the Association prior to October 1 next, provided the annual dues to October next be paid at the time the application for membership is made.

The President appointed the following named gentlemen as a committee of five on Standardizing of Street Railway Equipment: J. R. Graham, Boston; N. H. Heft, Meriden; F. G. Jones, Memphis; W. J. Hield, Minneapolis, and C. F. Holmes, Kansas City. The Committee was authorized to incur an expenditure not to exceed \$1,000.

The President also appointed the following named gentlemen as a committee of three to report at the next Convention on the subject of transporting the mail and mail carriers on street railway cars: C. S. Sergeant, Boston; C. L. Rossiter, Brooklyn; J. B. Parsons, Philadelphia.

It is confidently expected that the forthcoming meeting will be the most largely attended and of greater value from a practical standpoint than any that have been held.

The Executive Committee was most pleasantly entertained by President Vreeland, of the Metropolitan Street Railway Company, during the stay of its members in the city.

The Standard Underground Cable Company beg to inform the public that hereafter the headquarters of its northeastern sales department will be located in the Tremont Building, Tremont and Beacon streets, Boston, Mass., and requests that communications for the company be addressed to those offices, where they will receive immediate and careful attention.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 17.

INCANDESCENT LIGHTING.

Illumination by the use of the electric current would never have achieved the popularity and success which it at present enjoys had it been confined to the arc lamp. As a matter of fact, the arc light in the earlier days of its history did considerable to render electric lighting unpopular. At the time of its introduction it was just the opposite extreme to what the people had been used to, and on account of the vast difference between the degree of light produced by it and the light produced by candles, oil lamps or a low grade of illuminating gas, the people became very prejudiced against its use except for street or park purposes.

FIG. 1.

The opinion prevailed that the intense brilliancy was hurtful and injurious to the eyes, and that so glaring a light could never displace the soft, mellow glow of gas or candles to which they were accustomed, and that unless some form of electric lamp could be devised to satisfactorily replace these, and be conveniently introduced into houses, electricity would never be adopted.

This acted as an incentive to the inventors and scientists to work with the object of producing an electric light which would solve the difficulty, and as a result we have to-day the incandescent lamp. To a certain extent the experiments with the incandescent lamp were dependent upon another scientific discovery, which was the development of the mercury pump for producing a vacuum. This enabled the production of the lamps to be brought to a successful conclusion.

When first introduced on the market the incandescent lamp was very expensive, which was a retarding feature for a while to its general adoption, but as a result of competition of manufacturers and improved methods and machinery for its production, the price has been greatly reduced and has made it the popular illuminating medium that it is to-day.

The first experiments with the incandescent

lamp were by using wire for the filament, but not a great deal of success was attained in that direction. The only conducting material that would stand the high temperature of incandescence was found to be carbon. Carbon burns away when subjected to a large temperature and exposed to the air. In a globe from which the air has been exhausted carbon will not be consumed however, as there will be no combustion when oxygen does not exist.

FIG. 2.

The filaments used for the lamps are made of bamboo strips, or from cotton or silk threads carbonized. In their construction the material is first made into the proper size to produce a filament. After being subjected to a certain treatment the threads or strips are bent around "forming blocks" of carbon and packed in a crucible filled with powdered carbon. They are then subjected to a baking process of many hours until they are perfectly carbonized.

After this the filaments undergo another treatment whereby very fine, hard, powdered carbon is deposited upon their surfaces.

This is done to make them withstand the strain of a high temperature.

The ends of a filament are then secured, by means of a suitable cement, to two short pieces of platinum wire which are sealed in the glass and used as conductors through the glass bulb for the current. The air is then exhausted from the bulb by means of a vacuum pump, after which it is sealed at the point where the tube from the pump connects with it.

Fig. 1 illustrates a vacuum pump, involving the principle whereby the air is exhausted from the lamp, and is the one generally used, except probably in a modified form.

This is substantially an air pump made of glass in which mercury is used as a plunger in order that there may be no chance for a leakage of air.

FIG. 3.

A and B represent two glass bulbs which are connected by a glass tube forming a U-shape. Just below A a tap leads off to the lamps to be exhausted. This tap may lead through a chamber X containing some material intended to absorb any moisture which may exist in the air that passes through it. This is necessary, as it is essential that the pump be kept perfectly dry. By means of a suction at the point O the mercury is caused to rise in the bulb A from which the air will be expelled. Then by closing the tap R and drawing the mercury back into bulb B, a vacuum will be established in bulb A and will draw a new portion of air from the lamps. This operation is continued until all the air is practically exhausted from the lamps, after which they are melted or sealed off, where they are connected to the tube. This sealing off process leaves the sharp tip which is noticeable on the end of a lamp.

The operation of the current in an incandescent lamp is simply the energy of the current

overcoming the resistance offered to it by the carbon filament producing heat. The amount of current flowing will of course be governed by Ohm's Law, whereas the pressure of the current divided by the resistance of the filament will equal the current flowing.

Series incandescent lighting is sometimes indulged in for street lighting in a manner similar to a circuit for arc lamps. Lamps are also manufactured to be used on an arc circuit and connected in series, as in Fig. 2.

They are made with larger filaments intended to reach their rated candle power when using the entire amount of current flowing in the circuit. This is not at all an economical method and is only indulged in, to any extent, in small towns where arc machines are operated and some incandescent lamps may be required but not enough to admit of the installation of an incandescent machine. This system however at the present day has become almost obsolete.

Another form of series incandescent lighting is where a number of lamps are placed in series across a multiple circuit of high voltage, as for instance the lamps used in electric street cars. As the voltage on such a circuit ranges generally from 500 to 550 the lamps may be five 110 volt ones connected in series, illustrated by Fig. 3.

FIG. 4.

This would permit of the proper amount of current to be flowing in each lamp, as it would require 550 volts to force an ampere over five 110 cp. 110 volt lamps connected in series. This might be properly termed multiple-series lighting, as the placing of lamps would consist of series of five each connected in multiple across the circuit.

Of course the generally adopted and most universal method of incandescent lighting is the multiple system, as shown in Fig. 4.

This is simply that the voltage of the supply circuit is the same as that required for the proper operation of the lamps individually, and wherein each and every lamp is connected directly across the circuit, and is entirely independent of any or all other lamps on the circuit.

The aim in this should be to have the circuits so arranged that a uniform and equal electrical pressure will exist at all points where lamps are connected.

This is essential to securing satisfaction and long life of the lamps.

The following figures give a good illustration of the great advantages derived from electric lighting over other methods:

TABLE SHOWING THE ADVANTAGES TO BE DERIVED BY THE USE OF ELECTRIC LIGHT.

Light-producing material equal to 12 standard candles.	Cubic feet of oxygen consumed.	Cubic feet of air consumed.	Cubic feet of carbonic acid produced.
Common gas.....	5.45	17.25	8.21
Sperm oil.....	4.75	23.75	3.98
Paraffin.....	6.81	34.5	4.50
Wax candles.....	8.41	42.05	5.03
Tallow candles.....	12.00	60.00	8.78
Electric light.....	None	None	None

Article No. 18 will be entitled "Hints for the Dynamo Tender."

TESTING CELLS AND BATTERIES IN THE BRITISH NAVY.*

There are two classes of cells used in the navy; one kind possesses a very high internal resistance and is used for testing, while the other kind is for use in performing some kind of work.

The single test cell is a Minotto or modified form of Daniell, consisting of a cylindrical vulcanite container, in the bottom of which is placed a copper cup containing crystals of sulphate of copper.

A piece of thick flannel or "fearnought" is placed on top of this, then a thick layer of fine sawdust, another disk of fearnought, and on this a zinc slab. An insulated wire passes up from the copper cup and forms the positive pole. The negative pole is formed by a wire leading from the zinc.

The container is closed by a vulcanite top through which both wires lead, the positive to

DIAGRAM OF CONNECTIONS.

a terminal and the negative to a small brass nipple.

The rest of the space on top of the battery is taken up by a galvanometer with a resistance of 20 ohms. One terminal of the galvanometer is free, and the other is connected to a key or spring of brass, which forms contact with the nipple of the negative pole on pressure being applied by the finger.

The battery as supplied may be stowed away until required for use; the sawdust being dry, no action takes place.

When required for service the fearnought and sawdust are soaked in fresh water, and the battery is put on short circuit for half an hour. The battery is then ready for use.

When the galvanometer is set so that the pointer is at zero, upon the key being pressed there should be a steady deflection of 80 on short circuit. The whole instrument is enclosed in a leather case with a strap for convenience in carrying; a magnet is also supplied in a pocket on the leather case, for the purpose of steadying the pointer on the galvanometer. This single cell test battery is good enough for all ordinary tests.

The six-cell test battery consists of six Minotto cells, contained in a wooden box. Besides having a hinged top, the front of the box opens outward and forms a tray, upon which is fixed a 1,000 ohm galvanometer, a spring key and

*From the "Electrical Review," London.

the main terminals. It is customary in the navy to work always from the negative pole, connecting the positive pole direct to earth.

The system of brass blocks, which is fixed on to the partition that keeps the battery in place, consists of one long strip of brass, having on either side of it three smaller strips, each of which is connected to the negative pole of its own cell.

The long strip is connected with the galvanometer, and the negative pole of any cell can be brought into connection with it by means of a brass plug, thus putting from one to six cells into the circuit (see diagram).

III.—POLYPHASE ELECTRIC RAILWAYS IN EUROPE.

BY FRANK C. PERKINS.

The Jungfrau Three-Phase Railway.

At the Jungfrau installation two generating stations will ultimately be used with a total capacity of 5,000 horse power. The first power house to be constructed was that at Lauterbrunnen, on the White Lutschine. This station is now in operation and supplies more than 2,000 horse power, while the power house, to be known as the Burglauen station, will

FIG. 1.—PLAN OF POWER HOUSE OF THE JUNGFRAU ELECTRIC RAILWAY.

The cells used in this battery are considerably smaller than in the "single-cell test battery," and are of an oblong shape, for better storage purposes. The galvanometer is astatic, and consequently far more sensitive than in the 20-ohm pattern. Before use the battery itself is invariably tested, to see that each cell is in good condition, by connecting the galvanometer direct to each cell in turn.

The six-cell test battery is used for testing where a high insulation has to be measured, or where the resistance is large as in cables of great length. A simpler battery, in which a circular switch takes the place of the plug and brass strips, is now coming into use.

The test cells being of the Daniell class they are, of course, very constant, and their internal resistance is so high that their current can be passed through any fuse to test it without the slightest chance of firing it.

Chance for American Manufacturers.

Consul Marshal Halstead, of Birmingham, Eng., notifies the State Department that he has been requested to announce that an English electric-supply company wishes to open up correspondence with American manufacturers of electrical accessories. Further information may be had by applying to the Consul reporting.

After several unsuccessful trials with a hot water motor for propelling trains through the New York Central tunnel, leading out of the city, the engineers of the road have decided to make use of the third-rail electric system similar to that recently adopted by the Baltimore & Ohio Railroad.

be located near Grindelwald on the Black Lutschine. The water is supplied to the present Lauterbrunnen station from the White Lutschine through a steel pipe 1.8 meters or about 6 feet internal diameter and nearly half a mile in length. This first section is built up of lengths of about 20 feet and 5 millimeters thick, while a second section of nearly the same length is constructed of steel 7 millimeters in thickness and in lengths about 25 feet each.

The water is supplied to the turbines under a head of 125 feet. The turbines are of the twin Gerard design and were manufactured by J. J. Rieter & Co. There are six turbines in all, three of 500 horse power each and one of 800 horse power, directly connected to Oerlikon polyphase alternators, as shown in plan, Fig 1.

These alternators operate at a speed of 380 revolutions per minute and supply a current having a frequency of 38 periods per second.

These direct-connected three-phase generators have stationary armatures and stationary field coils, as they are of the inductor type. They are high potential machines, generating a current at 7,000 volts pressure.

Two exciter turbines of 25 horse power each are used for operating two direct current dynamos supplying a current of 150 amperes at 120 volts.

The total length of the transmission line from Lauterbrunnen to the Jungfrau is nearly 20 miles. A drop of 700 volts is allowed for the total loss on the line. There are three conductors of about 8 millimeters in diameter mounted on large triple petticoat porcelain insulators. The distance from the power house to the first sub-station at Scheidegg is nearly four

miles, and this transformer station is located on a level nearly one mile higher than the power house.

The Scheidegg sub-station is supplied with two transformers of 200 kilowatts capacity, and the sub-stations at Elgergletscher, Garge, Elsmeer, Jungfrau, Joch and Jungfrau Kulm, are

various parts of locomotives partly assembled. The driving axles are arranged with rack pinions of aluminum bronze and brake wheels and blocks are provided, as will be noted in illustrations.

Sliding contacts on trolley poles take the place of trolley wheels. The speed attained is

moves two toothed pinions working in racks on the sides of the shaft.

This complete mountain electric system will be watched with great interest, as the problem of railway operation by polyphase currents is in a fair way to be satisfactorily solved.

ACIDS FOR FILLING ELECTRIC ACCUMULATORS.

BY RUDOLF HEINZ.

Translated for *ELECTRICITY* from "Centralblatt für Accumulatoren-und Elementenkunde," Berlin.

The durability and efficiency of electric accumulators depend to a large extent upon the sulphuric acid or so-called filling acid used in them and its importance is not generally recognized. The acid ought to be quite clear and have no impurities of any kind, but as absolute purity cannot possibly be guaranteed, manufacturers of accumulators have fixed a maximum figure for the admissible injurious impurities, which sulphuric acid may be allowed to contain and still be considered serviceable for filling accumulators.

Apart from its specific weight, the acid must be quite free from metals, especially those of the hydrothionic group, with the exception of lead. It may contain at the most the following metals of the sulphide of ammonia group: 0.01 per cent. of iron; of chlorine 0.002 per cent. and of nitrogen in the form of ammoniac, nitric acid, nitrous acid and others, no more than 0.1 per cent., always reckoned as hydrated sulphuric acid. It should be entirely free from all organic substances, and as far as possible it should also be free from hydrothionic acid.

Supply houses that fill orders for accumulator filling acid are generally bound to observe the foregoing limits of purity, and they have

FIG. 2.—ENTRANCE TO TUNNEL OF JUNGFRAU ELECTRIC RAILWAY, SHOWING 7,000 VOLT TRANSMISSION LINE.

similarly supplied with three-phase step-down static transformers, whose office it is to reduce the potential from 7,000 volts used on the line to 550 volts used in the trolley feeders. There are twelve sub-stations designed for the entire line, ranging from 2,000 meters to 4,000 meters above the sea level, and at distances from 6,000 feet to 40,000 feet from the first sub-station at Scheidegg.

The tunnels, which are about seven miles in length, cost nearly \$1,000,000. The entrance to the tunnel under construction is noted in illustration, Fig. 2.

At the gallery entrance transformers of 400 kilowatts capacity have been provided for supplying three-phase currents for operating the rotary and percussion drills. These drilling machines are seen in operation in the view, Fig. 3. The stations are lighted and heated by electric radiators and hundreds of 16 cp. incandescent lamps. The lighting of the tunnel is also met by arranging these lamps continuously from 80 to 90 feet apart. The polyphase locomotives used on the Jungfrau line in various stages of construction are shown in Figs. 4 and 5.

The Oerlikon Company was extremely courteous in supplying photographs and data illustrated in this article.

The first locomotives built for this line were supplied by Brown, Boveri & Cie of Winterthur. Two motors of 150 horse power each are used on each locomotive, the normal speed being 760 revolutions a minute.

A number of Oerlikon polyphase locomotives are in operation and are each equipped with two 200 hp. three-phase motors having a normal speed of 500 revolutions per minute. The details of construction are indicated on the

from 8 to 9 miles per hour while the maximum gradient is 25 per cent. The summit is reached without the electric railway in two

FIG. 3.—POLYPHASE ELECTRIC DRILLS IN JUNGFRAU RAILWAY TUNNEL.

days and two nights at an expense varying from \$25 to \$50, while an electric railway trip to the summit will require only two or three hours and at a very moderate expense. The electric elevator at the summit is operated by a three-phase motor on the elevator cage and

eventually to answer for supplying poor filling acid and the consequent damages that ensue, and in view of this fact, they may reasonably charge the consumer somewhat advanced prices, and they often do charge at times exorbitantly high prices.

Although these guarantees are universally given, the protection so far afforded to the owner of accumulators is often but a relative one and more or less worthless. There is only a very small number of owners of accumulators who are in a position to test the filling

not always free from it. The acid produced from sulphurated hydrogen can be considered free from arsenic. All these acids usually take up during concentration in the usual platinum or platinum-gold apparatus more or less of these metals and their possible impurities, and

The damages resulting to accumulators from filling acid, which is not sufficiently pure, are, however, so considerable that a suitable purification of the sulphuric acid to be employed appears to be absolutely imperative, and particularly in cases where the so-called free arsenic sulphuric acid is used. Such a demand should especially be made in the interests of accumulator owners, but no less in the interest of accumulator manufacturers, inasmuch as they have in most cases to bear the damages resulting from use of an insufficiently purified filling acid. These rigorous conditions would be easily fulfilled by the sulphuric acid manufacturers, for they are in a position by which they can thoroughly cleanse the acid in such a manner as to satisfy every requirement. The mere dilution of concentrated sulphuric acid with water would then be avoided, and thus many an unreliable supply be made to disappear.

Electric Waves.

[From our London Correspondent.]

The Right Rev. Monsignor Gerald Molloy, D.D., D.Sc., of Dublin, has just delivered an interesting discourse before the Royal Institution in London on "Electric Waves." Opening with references to the nature of wave motion, Monsignor Molloy dealt briefly with the work of Clerk Maxwell, Hertz, Branly and Roentgen. He stated that the position of Roentgen's X-rays, though not yet certainly determined, was perhaps seven or eight octaves beyond the highest ultra violet rays so far explored, and that of Becquerel rays not quite so far. Electric waves were far down in the infra-red; they might vary in length from a fraction of an inch to a mile or so, but even the shortest so far produced was many octaves below the limit of infra-red radiations, as now known. Thus he said, the conception of light was reached, but the various forms of energy—light, heat, magnetism, etc., were all trans-

FIG. 4.—VIEW SHOWING REDUCTION GEAR OF ELECTRIC LOCOMOTIVE ON JUNGFRAU RAILWAY.

acid supplied to them for purity and utility, while an examination by an expert is expensive.

However, as the manufacturer undertakes to guarantee the accumulators he supplies for a term of years, on condition that they will always be carefully handled and especially that they will only be filled with pure acid, the examination of the acid supplied for filling them from time to time could be made by the latter; but here also the advantages secured would be considered doubtful, for these facts are mostly ascertained when it is too late. Therefore, the owners of electric accumulators are not always in a position to properly care for them, as they find it impossible to use an acid which is unquestionably clean in compliance with rules furnished them.

From many years of my experience in the manufacture of sulphuric acid, and more particularly in the preparation of filling acid for accumulators, I can testify that only a very small fraction of the filling acid used by the trade is ever purified, particularly that treatment prescribed with hydrothionic acid or sulphuric barium.

In most cases the so-called free arsenic sulphuric acid represented by crude sulphur, or also by the sulphurated hydrogen, as a by-product, is concentrated in platinum and platinum gold boilers at 66° Be., which is simply thinned with water to the specific gravity of the filling acid. Very often the distillation acid obtained in the concentration of the regular sulphuric acid is adulterated to make a filling acid. I have even known of cases where ordinary 66° sulphuric acid, diluted only with water, has been supplied as a filling acid. In many cases impure water is used as an adulteration, such as the water from the mains or from pumps. Of course the latter instances are exceptional cases, therefore only the first-named will be considered.

Sulphuric acid made from raw sulphur is mostly free from arsenic. It contains traces of arsenic, however, for the crude sulphur is

they remain in the acid after its dilution. Iron or other metals of the sulphur-ammonia group are mostly contained in such acids in small quantities, while chlorine exists in differing quantities, and there may be more or less nitric or nitrous acids, but inasmuch as these substances seriously effect the concentration apparatus, endeavors are made to annul these deleterious effects by adding sulphurated ammonia, which is successfully accomplished, but this means has the serious disadvantage in that too much ammonia salt is used,

FIG. 5.—TWO 200-HP. POLYPHASE MOTORS ON ELECTRIC LOCOMOTIVE ON JUNGFRAU RAILWAY.

which often remains in quantities of many per cent. in the acid. It is not to be supposed that in most cases there are any organic connections—neither can there be any sulphurated hydrogen, as the acid is not cleansed therewith.

It is clear that such sulphuric acid, merely diluted with water to the specific weight prescribed, cannot give a filling acid purified to the extent required.

mitted through space as vibrations of the ether, being, so to speak, notes of different pitch on the great scale of radiant energy. The lecturer remarked that twentieth century physicists would find out more thoroughly the nature of these ethereal vibrations, and they would also fill up the gaps between the various kinds and perhaps explain the ether—the mystery of mysteries which underlay all these phenomena.

ELECTRICITY AT THE EXPOSITION.

The Dominant Feature of the Pan-American is to be an Unparalleled Electrical Show.

The marvelous progress in the development and application of the various branches of the electrical science and industry of recent years will be shown in the magnificent Electricity Building of the Pan-American Exposition. Like the other large exhibit buildings of the Exposition, this one is of modernized Spanish renaissance architecture, covered with staff, artistically colored and adorned with sculpture. In dimensions it is 500 by 150 feet.

The splendid towers of the Electricity Building rise to great heights, two over the south

interesting exhibit will be that illustrating the application of electricity to the propulsion of cars and vehicles like the automobiles. Most persons are more familiar with the successful operation of such vehicles by electricity than with the means to this end. On this account it is hoped to illustrate them at the Exposition in such a manner that the interrelation of the various elements will be quite apparent. The utilization of electricity in various forms of manufacturing industries will also be illustrated. This utilization of electricity is destined to be one of the greatest of its fields, and the Niagara frontier is now an object lesson in this respect, for the development of Niagara power is almost every day drawing new industries to this region, because the

stimulate more general study of this great field of science. J. M.

LONDON NOTES.

(From our London Correspondent.)

X-Rays in the South African War.

The X-ray apparatus sent out to South Africa played an interesting part in the campaign, more particularly the sets which were doing humane service at Ladysmith during the long siege. Lieutenant Bruce, whose X-ray work has already been periodically noticed in the columns of *ELECTRICITY*, was in charge of the department and has just explained the Ladysmith operations before the Roentgen So-

entrance being 158 feet high, and two over the north entrance 128 feet high. They are very elaborate in design and among the most beautiful features of the Exposition architecture.

In ten years the electric motor in its application to both transportation and industry has effected well nigh an industrial revolution. In the electric lighting industry and in the telephone system there has been great progress during this decade. Wireless telegraphy has come to the front within a few years and is destined to effect still further radical changes in methods of electric communication. Automobiles electrically propelled have come into use. In all these fields the Pan-American Exposition will have electrical exhibits illustrating this marvelous progress. There will be a collection of historical matter relating to the subject which will show the gradual development of the apparatus used. An especially

proximity and the availability of this power render the manufacturing opportunities so exceptional. The aim will be to make the electrical exhibit in the Electricity Building a collective one rather than one composed exclusively of individual commercial exhibits. The exhibit will be divided into two groups:

1st. The collective exhibit, which will consist of retrospective exhibits of historical interest illustrating models, or practical contrasts showing the advances in the art.

2d. The commercial exhibit, composed of those exhibits possessing distinctive merit, whether this consists in workmanship, novelties or useful applications.

As a whole, the exhibits in this building will be both attractive and educational in a degree not before realized at any exposition held upon the American continent. They will serve to excite popular interest, and in this way to

ciety, London, in a paper entitled "Experience of X-Ray Work During the Siege of Ladysmith." The photographs which were shown to the audience were excellent, considering the great difficulties under which they were taken and developed. Altogether some 200 cases were subjected to the exposure, and nearly one-half of them were photographed. The Lieutenant related some of the difficulties encountered, the chief being obtaining a supply of electricity, seeing that Ladysmith was not electrically lighted. He has no belief in the system of drawing a dynamo by a cyclist; to charge six cells in that way was like climbing a very steep hill. On one occasion at Elands-laagte the supply of electricity ran out, and a dynamo which Lieutenant Bruce had with him was attached to the shafting of a local flour mill and the arrangement seems to have answered admirably. The experience

gained led the author to think that a properly constructed operating table is required which would enable the photograph to be taken from below. Another point, for field use an outfit was not complete unless it had its own machinery for producing electricity. A small oil motor for driving the dynamo was suggested.

A Three-phase Lighting Scheme.

The local authorities in East Middlesex are combining to carry out a \$2,000,000 three-phase high tension lighting and power scheme. With a 4,000 kw. plant capacity at Edmonton, energy for 500 arc lamps, 100,000 8cp. incandescents, and 500 kw. for motors, would be distributed to sub-stations for the supply of the districts of Edmonton, Enfield, Southgate, Tottenham and Woodgreen. The consulting engineers are Mr. Robert Hammond, and Mr. Wm. W. C. Hawtayne of London. A two-phase system was first thought of, but a three-phase is thought to meet the conditions better.

Two Important Patents Declared Invalid.

The General Electric Company has just had two of its important magnetic blow-out patents declared invalid, and its Knight interlock patent declared not infringed. The United States Circuit Court of Appeals for this circuit has just handed down opinions declaring invalid the two patents, known to the trade as the magnetic blow-out patent, which were granted on the inventions of Elihu Thomson, No. 283,167, dated August 14, 1883, and No. 401,085, dated April 9, 1889. The cases were prosecuted by the General Electric Company, and were defended by the Lorain Steel Company, a sub-company of the Federal Steel, and the decision marks the end of a long litigation and throws the subject matter of the patents open to the public. The first patent, No. 283,167, was broadly for the application of a powerful magnetic field to the contact surfaces of an electric switch in order to blow out or disrupt any arc that might tend to form between those contact surfaces upon the operation of the switch. It was a combination which was found practically necessary to be used in devices for switching or breaking the enormous currents involved in modern trolley service and its use has been widespread. The patent was almost universally respected by the trade, to a degree probably unique among our litigated electrical patents, in consequence of which the litigation in respect to it came only in the last year or two of the term of the patent. The patent came first before Judge Thomas, of the Eastern District, in *Thomson-Houston Electric Company vs. Nassau Electric Railroad Company*, and was by him declared invalid. It came next before Judge Wheeler in *Thomson-Houston Electric Company vs. Bullock Electric Company*, who followed Judge Thomas. Both of these decisions have just been affirmed on appeal. The second magnetic blow-out patent, No. 401,085, was for the combination of insulation with the magnetic blow-out of the earlier patent and was also widely and necessarily employed. It came first before Judge Wheeler in the *Bullock* case, where it was upheld as valid and as infringed. The present decision on appeal reverses this holding and declares the patent invalid like the first. Both patents are held invalid on the general and common knowledge of the art. The Knight interlock patent, which is not of such general interest or importance, is for a two handle regulator or controller and has been narrowly construed and so rendered practically valueless.

THE BERLINER PATENT VOID.

Judge Brown so Decides in the Suit of the American Bell Telephone Company vs. the National Telephone Manufacturing Company.

DECIDED VICTORY FOR THE INDEPENDENT TELEPHONE COMPANIES.

On Wednesday last in Boston Judge Brown, of the United States Circuit Court, decided against the American Bell Telephone Company in the famous Berliner patent case. The suits were the Bell Company against the National Telephone Manufacturing Company and others and the same against the Century Telephone Company, brought to restrain respondents from selling, using or making telephones or telephonic apparatus with the microphone attachment, and to account to the Bell Company for past use, manufacture and sales, upon the ground that such use, manufacture or sale was an infringement of patent.

The cases were argued before Judge Brown a year and a half ago, and as they related to the same patent—the microphone—were put in together and were tried as if they were one case.

The Berliner patent has been considered one of the most important held by the Bell Company, and it does not expire until November 17, 1908.

In February, 1893, the Attorney General of the United States brought a suit against the American Bell Telephone Company in behalf of the United States. It was argued in June, 1894, before Judge Carpenter, of the United States Circuit Court for the District of Massachusetts. Judge Carpenter ordered the cancellation of the patent on the ground of fraudulent delay in the Patent Office and a previous patent issued to Berliner, which disclosed and claimed the identical apparatus claimed in the patent in suit. The case was appealed to the Circuit Court of Appeals which overruled Judge Carpenter, and the United States then appealed to the Supreme Court.

The patent in question was applied for June 4, 1877, by Emile Berliner, and was held in the Patent Office until November 17, 1891, before it was issued to the American Bell Company. More than a year prior to Berliner's application the Government granted to Alexander Graham Bell the fundamental patent on telephony. He claimed "the method of, and apparatus for, transmitting vocal and other sounds telegraphically, as herein described, by causing electrical undulations, similar in form to the vibrations of the air accompanying the said vocal or other sounds, substantially as set forth." He also claimed "the method of producing undulations in a continuous voltaic circuit by gradually increasing and diminishing the resistance of the circuit as set forth." This covered Bell's magneto telephone, which is now, and has been from the first, universally used as the receiver. It has been held that this claim covers the method of all microphones, and that Bell's original patent having expired in 1893 the right to use a microphone for the electrical transmission of speech is open to the world.

Just prior to the expiration of this patent of Bell's, however, the Berliner patent was issued to the Bell Company. It had slumbered in the Patent Office for more than fourteen years, and under it the Bell Company hoped to extend its monopoly for seventeen years longer, or a total period of thirty-two years. The similarity of its claims to those of the original Bell patent will be obvious, viz.: "the method of producing in a circuit electrical undulations similar in form to sound waves by causing the sound waves to vary the pressure between electrodes in constant contact, so as to strengthen and weaken the contact, and thereby increase and diminish the resistance of the circuit substantially as described." This is evidently a distinction without a difference. The second claim covers the transmitter as an apparatus for thus transmitting speech.

The argument of the Bell Company's counsel was that the patent was secured under the rules of the Patent Office, and that it was absolutely impossible for them to have hastened its issue. On the contrary, the United States claimed that the delay was not only unnecessary, but that it amounted to bad faith toward the public on the part of the Bell Company. It also claimed irregular procedure in the Patent Office and the insertion of new material subsequent to the filing of the application; that the original application did not describe the constant contact, variable resistance transmitter as the patent was issued, but that it did describe a "make-and-break" transmitter; that the original application and drawings were twice erased and stricken out and new ones substituted containing the constant contact device, also that the Berliner invention in question was described and disclosed and claimed in combination with the identical apparatus used as a receiver in the patent of November 2, 1880, granted to Emile Berliner.

On May 10, 1897, Justice Brewer of the United States Supreme Court affirmed the decision of the United States Circuit Court of Appeals, thus leaving the Berliner patent unprejudiced before the law, and in exactly the same condition as any other adjudicated patent issued from the Patent Office.

The American Bell Company then brought suit against the National Telephone Manufacturing Company and the Century Telephone Company for infringement. The actions were tried together and this is the suit that has just been decided. Judge Brown in handing down his decision says:

"The decree in this case must be for the defendants. I find the Berliner patent invalid because, at the date of the application, June 4, 1877, Berliner had not made the invention covered by the patents issued to the American Bell Telephone Company on November 17, 1891. It is conclusive that Berliner had not

invented and did not intend to apply for a patent for a constant contact speech transmitter. I find, as a matter of fact, that Berliner did not before June 4, 1877, succeed in transmitting speech; but on the contrary was convinced by his experiments that speech could not be transmitted by the apparatus of the patent in suit.

"I find also that he did not at that date intend to describe or claim the apparatus as a speech transmitter. In view of the original application the complainant's case cannot be established without proof of successful experiments by Berliner. The invention set forth in the patent lay in experiment. In inventions of this class, the true date of conception is the date at which the experiment succeeds.

"The second ground of the decision is that the invention described in the patent is radically different from the invention described in the application. The original application by changes, purporting to be amendments, has been completely transformed into an application for a distinct invention. This transformation is of the most remarkable character and was made after Edison's carbon constant contact speech transmitter was invented and described in a printed publication. Such amendment is illegal, even if Berliner had made the invention before June 4, 1877.

"The third ground of the decision is to the effect that the invention was previously patented by Berliner. Berliner in 1880 took out a patent which covered the speech transmitter of the patent in the suit, applied to its appropriate use in a system, i. e., with a receiver. The effect of claim four of the 1880 patent was to give a monopoly of this instrument applied to its appropriate use without additional invention in making this application.

"By granting the patent of 1880 the Commissioner exhausted his power to issue a second patent whereby the patentee could control all use of this instrument as a transmitter. Having been protected for seventeen years in the use of this transmitter with one receiver, Berliner was not entitled to further protection for use with any and all receivers.

"The fourth ground is that Edison was the prior inventor. August 8, 1886, is the earliest date of Berliner's amendment affecting this controversy. Berliner's amended application is anticipated by Edison's application of July 20, 1877. The defendants owe nothing to Berliner."

The importance of this decision to independent telephone interests cannot be overestimated, as the independent movement was greatly handicapped by the fear that eventually the courts might decide in favor of the Bell Company.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended February 28:

Antwerp, 5 packages motors, \$700; 4 packages motor vehicles, \$850; 51 packages, \$5,554; Australia, 94 packages, \$6,221; Belfast, 1 cable, \$125; Bilbao, 1 package, \$23; Brazil, 8 packages, \$597; Bremen, 2 packages, \$146; British Possessions in Africa, 110 packages, \$5,056; British West Indies, 66 packages, \$563; Central America, 25 packages, \$667; Cuba, 67 packages \$2,072; Ecuador, 14 packages, \$1,320; Glasgow, 81 packages, \$9,034; 69 reels cable, \$24,763; 2 cases auto vehicles, \$2,500; Hamburg, 4 packages,

\$851; 99 cases, \$8,959; Havre, 20 packages, \$2,754; Hull, 45 packages, \$8,462; Liverpool, 75 packages, \$13,353; London, 74 packages, \$11,440; Mexico, 471 cases, \$10,474; Milan, 36 packages, \$3,119; Munich, 1 case, \$500; Naples, 1 case, \$512; Newcastle, 8 cases, \$829; Newfoundland, 7 packages, \$683; Nova Scotia, 3 packages, \$274; Peru, 61 packages, \$5,335; Ramsgate, 1 case, \$100; Reval, 3 cases, \$780; Santo Domingo, 23 packages, \$389; U. S. Colombia, 2 packages, \$60; Venezuela, 36 packages, \$1,306.

PERSONAL MENTION.

Mr. J. Nelson Kelman, formerly of the Stanley Electric Company, has accepted the position of superintendent of the Bay County Electric Company of Colgate, Cal.

Mr. Henry Gordon Stott, who built and equipped the great transformer station in Buffalo, N. Y., has been appointed superintendent of motive power of the Manhattan Railway Company of New York.

Mr. C. W. Sponsel has been elected superintendent of the Eddy Electric Company of Windsor, Conn.

Mr. George Hewes, for ten years manager of the Faribault, Minn., Consolidated Gas & Electric Company, now has a position with the Edison Electric Company at Des Moines, Ia.

INCORPORATIONS.

The W. G. Nagle Electric Company, Toledo, O. Capital stock, \$50,000. Incorporators: W. G. Nagel, S. R. McLaren and R. B. Chane.

The Compton Land, Water & Electric Company, Los Angeles, Cal. Capital stock, \$500,000. Directors: J. G. Compton, North Ontario; G. W. Cox, G. D. Sanford, Los Angeles; O. T. Sutton, Cucamonga, and R. W. Dawson, Azusa.

The People's Electric Light Company, Bowling Green, Ky. Capital stock, \$15,000.

The Meridian Electric Light & Railway Company, Meridian, Miss. Capital stock, \$25,000. Incorporators: J. Kamper, R. W. Stoutz and W. Ambrecht.

The Electric Insurance Company, Trenton, N. J. Capital stock, \$100,000.

The Sanborn-Marsh Electric Company, Indianapolis, Ind. Capital stock, \$15,000. Directors: Gerry M. Sanborn, Ashley M. Sanborn and Harry B. Marsh.

The Traction & Light Company, Trenton, N. J. Capital stock, \$1,000,000. Incorporators: Samuel Thomas and Samuel B. Lawrence, New York, and James C. Young, Jersey City.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 26, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

668,680. Electric Attachment for Railway Scales. Matthew H. Reed, Pittsburg, Pa. Filed March 30, 1900.

668,710-668,711-668,712. Electric Railway. George H. Davis, New York City, assignor to Frank R. Ford, George W. Bacon and George H. Davis, same place. Filed Sept. 15, 1900.

668,781. Electric-Traction System. Silvanus P. Thompson and Miles Walker, London, Eng. Filed Oct. 22, 1897.

668,819. Railway Signaling Apparatus. Washington Hume, New Broad Street, County of London, Eng. Filed Oct. 6, 1898.

668,903. Electric Bond for Railway-Rails. Harold P. Brown, Montclair, N. J. Filed April 7, 1900.

668,909. Electric Switch. Christopher J. Doran, Jersey City, N. J. Filed Sept. 11, 1900.

668,931. Trolley-Catcher. Francis W. Powers and Martin L. Snyder, West Lafayette, Ind. Filed Jan. 8, 1900.

668,977. Car-Fender. Adolph G. Carlson, Chicago, Ill. Filed March 29, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

668,630. Electric Lamp Protector. Edward Eckl, Milwaukee, Wis. Filed March 31, 1900.

668,658. Junction-Box for Electric Lighting Systems. Montgomery Waddell, New York City, assignor to the Electric Axle Light & Power Company, same place. Filed Jan. 31, 1900.

668,868. Alternating-Current Series Arc-Lamp. Malcolm H. Baker, New York City, assignor to the Manhattan

General Construction Company of New York. Filed Sept. 5, 1890. Renewed Oct. 4, 1900.

668,880. Electric-Arc Lamp. Peter H. F. Spies, Mount Vernon, N. Y., assignor to himself and Jacob Norden, same place. Filed June 5, 1900.

668,904. Incandescent Electric Lamp. Charles A. Chase, Chicago, Ill., assignor to the General Incandescent Lamp Company, Cleveland, O. Filed Dec. 8, 1900.

668,905. Automatic Circuit-Closer for Arc-Lamp Circuits. George R. Davison, Newark, N. J., assignor to the Manhattan General Construction Company, same place. Filed July 24, 1900.

669,015. Electric-Arc Lamp. Gustav Rasmus, New York City. Filed Nov. 30, 1900.

669,055-669,057. Electric Arc Lamp. Malcolm H. Baker, New York City, assignor to the Manhattan General Construction Company, same place. Filed Sept. 5, 1899, March 12, 1900.

669,058. Inclosed Arc Lamp. Malcolm H. Baker, New York City, assignor to the Manhattan General Construction Company, same place. Filed March 12, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

668,662. Electric Switch. John H. Spangler, Pittsburg, Pa. Filed Feb. 21, 1900.

668,690. Electric Accumulator. Paul F. Ribbe, Charlottenburg, Germany. Filed April 30, 1900.

668,798. Electric Switch. James Jones and James Jones, Jr., Brooklyn, N. Y. Filed Feb. 20, 1899.

668,887. Electric Switch. Peter H. F. Spies, Mount Vernon, N. Y., assignor of one-half to Jacob Norden, same place. Filed Aug. 2, 1900.

668,940. Electromagnetic Separator. Guy H. Waring, Tyrone, Pa. Filed Jan. 30, 1900.

668,963. Motor-Grouping System. Francis H. Shepard, New York City, assignor to the Sprague Electric Company of New Jersey. Filed Jan. 21, 1901.

668,978-668,979. Controlling Device for Electric Motors. Adolph G. Carlson, Chicago, Ill. Filed May 19, 1899.

669,052. Attachment for Static Electrical Machines. Gustavus Werber, Washington, D. C. Filed April 24, 1900.

669,058. Electric Amalgamator. Louis H. Barricks, San Francisco, Cal., assignor of one-half to Jesse G. Tunnicliffe, same place. Filed Aug. 6, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

668,658. Telephone Signaling Device. William O. Meissner, Chicago, Ill., assignor to Peter C. Burns, same place. Filed July 5, 1898.

668,702. Telephone-Transmitter. David H. Wilson, Chicago, Ill., assignor to Jay Morton, same place. Filed April 29, 1899.

668,907. Selective Signaling Apparatus. John A. Barrett Summit, N. J., assignor to the American Telephone and Telegraph Company of New York. Filed Sept. 20, 1900.

MISCELLANEOUS.

668,622. Secondary Battery. William R. Bowker, Waltham, Mass. Filed Feb. 15, 1900.

668,639. Motor Road-Vehicle. Charles E. Hadley, Hartford, Conn., assignor to the Columbia and Electric Vehicle Company, same place and Jersey City, N. J. Filed July 8, 1899.

668,661. Electric Bathing Apparatus. Oscar Echnelder, New York City. Filed July 12, 1900.

668,664. Storage-Battery System for Signaling Circuits. Nathan H. Suren, Needham, Mass. Filed June 19, 1899.

668,667. Charging System for Secondary Batteries. Montgomery Waddell, New York City, assignor to the Electric Axle Light and Power Company, same place. Filed Feb. 15, 1900.

668,708. Electric Cigar-Lighter. Charles A. Bernhardt, Detroit, Mich. Filed Jan. 15, 1900.

668,781. Apparatus for Connecting Storage Batteries with Charging-Lines. Nathan H. Suren, Needham, Mass. Filed June 29, 1899.

668,789. Automobile. Joseph Break, Spokane, Wash. Filed May 21, 1900.

668,779. Apparatus for Controlling Connections of Storage Batteries with Charging Circuits. Nathan H. Suren, Needham, Mass. Filed June 29, 1899.

668,791. Process of Electrical Separation of Conductors from Non-Conductors. Lucien I. Blate, Lawrence, and Lawrence N. Morscher, Neodesha, Kans. Filed March 16, 1899.

668,889-668,890. Telautograph. George S. Tiffany, Evans-ton, Ill., assignor to the Gray National Telautograph Company, New York City. Filed Oct. 19, 1900.

668,891-668,892-668,893-668,894. Telautograph. George S. Tiffany, Brooklyn, N. Y., assignor to the Gray National Telautograph Company, New York City. Filed Nov. 20, 1900, Dec. 20, 1900.

668,895. Method of Telautograph Transmission. George S. Tiffany, Brooklyn, N. Y., assignor to the Gray National Telautograph Company, New York City. Filed Dec. 21, 1900.

668,914. Power Transmitting and Reversing Gear. Oratus S. French, Fremont, Ohio. Filed Nov. 12, 1900.

THE TELEPHONE WORLD.

Telephone Companies to Combine.

A movement has been inaugurated in York, Pa., having in view the organization under one management of all the independent telephone lines in Pennsylvania, Maryland, Virginia and West Virginia. A committee of officials from the various lines of Pennsylvania has been appointed to work out the basis on which the different companies will be admitted to the new organization. The new company will be capitalized at \$27,000,000.

At the last meeting of the city council permission was granted the Memphis, Tenn., Telephone Company to begin the construction of its telephone plant. It was ordered, however, that underground construction should not begin until April 15, after all danger from frost had passed. The rates fixed in the contract between the city of Memphis and the company are \$48 per annum for business 'phones and \$36 for residence. The company is required to execute a bond in the sum of \$10,000 for the faithful performance of the contract. The contract further provides that the company shall furnish 15 free 'phones for the use of public offices. It is estimated that the construction work and equipment of the new plant will require the expenditure of about \$500,000. The number of employees required to operate the new system after completion will be close to 100.

A new telephone line about 550 miles in length is being constructed from Point Richmond, the terminus of the Santa Fe Railroad on San Francisco Bay, through Stockton by way of Bakersfield to Los Angeles, Cal. The line will follow the Santa Fe road and quite a number of new stations will be opened as the towns along the new trans-continental road have not been supplied with telephone communication heretofore. Several gangs of men are employed on the new system and it is being rushed to completion as fast as possible, but it will probably be two months before it is finished.

The management of the Detroit, Mich., Telephone Company, which was absorbed by the Michigan Company some time ago, but whose exchange is still in operation with a few hundred subscribers, announces a reduction of rates to \$32 for business and \$20 for residence 'phones, thus cutting under the rates which the new People's Telephone Company intends to charge. This is the first step in the war against the new company. When the People's Company plant is finished next fall Detroit will have three telephone systems.

Waterford, Me., must be connected with the rest of the world by a telephone line. This was the unanimous opinion of B. G. McIntire, Dr. C. M. Coolidge, C. D. Morse and about fifteen other business men of Waterford, who met to talk over the matter recently. The proposed line will be about 25 miles in length, connecting the villages of East Stoneham, North Waterford, Waterford and South Waterford with Paris and Norway.

A dispatch from Ottawa states that there is evidently good ground for the report published some days ago regarding the intention of the Canadian Government to nationalize the Canadian telegraph and telephone systems. The report is most insistent that negotiations are already well advanced looking to the acquisition of the great Northwestern telegraph system, the Canadian connection of the Western Union.

At a recent conference between citizens of Burwell, Neb., and representatives of the Broken Bow Telephone exchange it was decided that the exchange would extend its line from Taylor to Burwell, and from Comstock to Ord, giving Burwell connections with both places, as well as with Kearney and Broken Bow, Neb.

It has been authoritatively announced that the Sunset Telephone Company has decided to establish a telephone system between Bellingham Bay and Lynden and Sunas City, Wash., and other intermediate points, including Wier, Everson, Clearbrook and Nooksack, Wash.

The Southern New England Telephone Company, operating under a Bell license in Connecticut, and in which the American Telephone & Telegraph Company owns a 35 per cent interest, has filed a certificate of increase of capital from \$5,110 to \$7,600 shares.

A telephone company has been organized at Moulton, the county seat of Lawrence County, Ala. A telephone system will be put in there at once and the town will be connected with the Decatur and all surrounding towns.

The Denison & Choctaw Telephone Company has sold its line and exchange at Durant, I. T., to Captain Hughes of Bonham.

Annual Meeting of the Iowa Telephone Association.

The fifth annual meeting of the Iowa Telephone Association will convene in the club rooms of the Savary Hotel at Des Moines, Ia., on Tuesday, March 12, at 2 o'clock P. M., for a two days session. One of the most important questions to be discussed at this meeting is the matter of checking reports and making settlements between companies for inter-line toll business. Another very important subject which will be discussed at this meeting is "Farmers' Lines," their construction, equipment and the rates to be charged them, etc.

A large number of farmers and others interested in the extension of rural telephone lines met in New Castle, Ind., a short time ago and organized the Henry County Telephone Company. The capital stock is to be \$10,000 in shares of \$25 each. The purpose is to unite under one general management all the rural and small independent telephone systems of the county for purpose of co-operation in service and rates. The system will be extended to include all the larger towns of Henry County.

From St. Paul, Minn., comes the report that the first of April will see a reorganization in the present tangled affairs of the Mississippi Valley Telephone Company. The company because of insolvency is now in the courts, and the time for filing claims has practically expired. The receiver, E. E. Webster, of Minneapolis, is engaged in preparing his report for the court, and it will probably include a proposition for reorganization. Minneapolis and St. Paul financiers are desirous of getting control of the plant, and if the project goes through the reorganization will follow. No construction work of any kind is being done.

The Union Telephone Company of Alma, Mich., with lines reaching Saginaw and Northwestern Michigan, and the National Company of St. Johns, with lines to Lansing, Owosso, Pawamo and Ithaca, and connections with a large portion of the State, have decided to unite forces. The Union Company has \$73,000 paid in, and the National about \$20,000, and this will be the basis of union. The stock of the Union Company is held in dozens of villages in which the company does business, while the National stock is nearly all owned by John H. Fildew and John T. Millman. Both companies have earned good money.

The telephone competition, for which the citizens of Camden, N. J., have longed for many years, will within a few weeks be a reality. The superintendent of the Eastern Telephone & Telegraph Company reports that the central station equipment is entirely completed, and that the work of drawing the underground cables through the conduits and of stringing the overhead cables is nearly completed.

News from Whitefish Point, Mich., states that the steel "storm-warning tower" is now in place, and the light station will be connected by telephone with Grand Marais in the spring. All but 18 miles of the 50-mile line is now strung. There will be five life-saving stations, and the Whitefish Point lighthouse on the line.

Clark Grier, manager of the Macon and Dublin, Ga., Telephone Company, has petitioned the city council of Dublin for the right to establish and maintain a telephone exchange in that city. For several years Mr. Grier has operated a long distance line from Dublin to Macon, but has not attempted to compete with the Dublin telephone exchange for local business.

Although the ordinance regulating telephone rates in Kansas City, Mo., at \$45 and \$30 has been a law for several weeks no public attempt has been made to enforce it. R. B. Middlebrook, city counselor, is studying telephone legislation in other cities and is making a thorough investigation of legal tests that have been made, in an effort to decide how best to proceed under the new ordinance.

The common council of Battle Creek, Mich., has adopted a resolution instructing a committee to investigate and report upon the advisability of amending the city's charter so that it may own its municipal telephone plant. The citizens appear to be greatly in favor of the project.

An independent telephone company is preparing to put in an exchange at Hillsboro, Tex. Four hundred and fifty subscribers are announced. It will put in the Stromberg Carlson central flash light system.

William Gest & Co. of Cincinnati were recently awarded the contract for the construction of a new telephone and conduit system for the city of Memphis. The contract amounts to \$250,000.

At the annual meeting of the City & Suburban Telegraph Association (the telephone company) of Cincinnati, O., the old board of directors consisting of Capt. G. N. Stone, Henry Hanna, C. H. Kilgour, George Bullock, John Kilgour and C. J. French, was re-elected. The directors organized as before. President Stone's annual report showed that the company had handled 281,071 messages during the year, or an average of 637 a day. The following annual treasurer's report for the year ending December 31 is included: Capital stock outstanding, \$3,465,000; gross earnings, \$590,064.08; gross expenses, \$377,365.71; available for dividends, \$221,798.37.

At a recent meeting held at Alsen, S. D., a telephone company was organized to be known as the A. B. and F. Telephone Company. The shares of stock were taken principally by farmers in the vicinity of Alsen. The new company promises to run a line via Emmet to Beresford from Alsen and there connect with the long-distance telephone. The following officers were elected: C. B. Jacobson, president; A. Hendrixson, vice-president; Andrew Anderson, secretary; Rev. Father Traynor, Peter Lass and C. B. Thompson, board of directors.

L. W. Bailey, who is raising the money for the telephone line between Casper and Lander, Wyo., reports success in the enterprise and states that he will soon have \$9,000 worth of stock subscribed in Casper, after which he will go to Lander for the remainder. The line will run through Roades' road ranch, Hobert, Keg Springs, Walton, Buck camp, Muskrat, Golden Lake and the agency to Lander.

The directors of the Racket River Telephone Company of Potsdam, N. Y., have decided to raise the rates on commercial 'phones to \$15 a year. Formerly they were \$12. The rates for residences will remain \$12. The company has made many improvements to its system since it was first installed and gives excellent service with an all night service and Sunday hours.

The directors of the Troy, N. Y., Telephone & Telegraph Company met a short time ago for organization. The following were elected: President, George P. Ide; vice president, W. C. Humstone; second vice-president, Alba M. Ide; secretary, H. J. Richmond; treasurer, J. J. Fitzsimmons; general manager, Henry E. Hawley.

J. T. Hays, of Tallahassee, Fla., and associates are asking a city franchise to establish an independent telephone system in Pensacola of that State. The indications are that the franchise will be granted.

A telephone line is being built from Laurel Blumery Tenn., to Cut Laurel Gap, N. C. With the completion of this line, Johnson County, Tenn., will have very good telephonic connection.

The Sedgwick County, Kan., telephone bill has reached the Senate. It was introduced by Senator Tapp and authorizes Sedgwick County to construct and maintain a local and long-distance telephone system.

The Carthage, Mo., Electric Telephone Company has completed its new line to Oronogo and now has direct connection with Oronogo, Neek City, Quaker Mills and Mansur.

The Independent Telephone Company is quietly going about the establishment of its system in Binghamton, N. Y., and before many months it will be in operation.

A. Ross has completed arrangements for instituting a telephone exchange in Webster, S. D., as soon this spring as the poles can be set.

Geneva, N. Y., may install a telephone fire alarm system.

TELEPHONE INCORPORATIONS.

The Telephone Directory Publishing Company, New York City. Capital stock, \$3,000. Directors: J. G. Quigley, J. P. Howard and L. W. E. Ianes, New York City.

The Farmers' Exchange Telephone Company, Camp Point, Ill.—to operate a telephone line. Capital stock, \$2,000. Incorporators: J. E. Simmonds, Leonard G. Hoke and Rufus McVay.

The Davilla Telephone & Improvement Company, Davilla, Tex.—to construct and operate a telephone system in Milam, Bell and Williamson Counties. Capital stock, \$10,000. Incorporators: J. C. Cronk, Robert P. Kerr, E. H. White and others.

The Globe Automatic Telephone Company, Chicago—to do a manufacturing and telephone business. Capital stock, \$25,000. Incorporators: John E. Norling and others.

GENERAL ELECTRICAL NEWS.

Lighting.

Amherst, Wis.—This village contemplates the erection of an electric light plant.

Ashton, Ill.—A movement has been started to erect an electric light plant in this city.

Belfry, Pa.—Worcester farmers are contemplating the erection of a township electric light and power plant at this place with a local telephone system.

Berryville, Va.—The question of establishing an electric light plant in this town is being agitated.

Breese, Ill.—The village council has decided to establish an electric light plant. F. Burhorn, H. Niemann and B. Ess are on the committee.

Canton, Ga.—Capt. T. M. Brady will install an electric light plant for his place of business, and probably the plant will be large enough for lighting the town.

Carsonville, Mich.—The question of bonding for electric lights will be voted on this month.

Collinwood, O.—This place will be bonded for the sum of \$22,000 to establish an electric light plant and \$40,000 to extend the waterworks system.

Cooperstown, N. D.—Wm. Brueske is figuring on putting in an electric light plant here.

Fort Valley, Ga.—Crandall & Gray contemplate establishing an electric light plant.

Grantsburg, Wis.—A. P. Nelson is here investigating with a view to building an electric light plant.

Holstein, Ia.—A municipal electric light plant is being talked of in this town.

Hot Springs, S.D.—Messrs. Parks & Mueller, owners of the electric light plant here, contemplate the purchase of new machinery soon.

Jonesboro, Ind.—It is proposed soon to erect an electric light plant here.

Mayville, Mich.—The proposition to bond this village for an electric lighting plant will be voted on by the citizens at the spring election.

Mediapolis, Ia.—The city council is preparing to erect an electric light plant.

Minneapolis, Minn.—The Donaldson Glass Block of this city will erect a new addition to its lighting plant.

Nashua, N. H.—A resolution will be presented at the next council meeting, calling for the appointment of a committee to look into the cost and advisability of building an electric light plant under municipal ownership to furnish lights for the streets of this city. Ed. Everett is at the head of the movement.

Pine Bluff, Ark.—The city council has granted to the Pine Bluff City Lumber Company a franchise for building an electric street railway and lighting plant here. It proposes to erect a \$150,000 lighting plant.

Port Deposit, Md.—The Jacob Tome Institute has purchased the plant of the Port Deposit Electric Light Company, and will enlarge the same by installing new dynamos, etc.

Reading, Mich.—The citizens will vote on the proposition to light this village with electricity at the approaching spring election.

Rutland, Vt.—The following question is to be inserted in the warrant for the coming city election: Shall the city of Rutland build, or purchase, equip and manage an electric light plant for the purpose of furnishing light for the city and its citizens?

Sauk Rapids, Minn.—The village council has passed an ordinance granting to the Light, Heat, Transit & Public Service Company the right to erect and maintain an electric lighting plant.

Silverton, Col.—The Silverton electric light plant has been purchased by a company headed by F. C. Adams and J. J. Henry. The new company will enlarge the plant.

Tampa, Fla.—This city contemplates the erection of an electric light plant.

Valentine, Neb.—S. F. Gilman, who owns the flouring mill here, which is propelled by water power, is going to employ the surplus power in supplying an electric light plant for street and domestic lighting.

Wallowa, Ore.—This place will be equipped with a new electric lighting plant.

Street Railways.

Cassville, W. Va.—James A. Milholland, of Cumberland, has lately been here looking after the interests of the Cassville & Morgantown Railroad, a big electrical enterprise that will run 15 miles through this district.

Charles City, Ia.—S. L. Kern of this place and G. W. Dawson of Waterloo have asked for a franchise to operate an electric street car line in this city, and the question will be submitted to the voters at the March election. They propose to build a line from this city to Greene in Butler County, a distance of 20 miles.

Chicago.—If the extension of the franchise of the Chicago City Railway Company for a term of years on terms reasonable to both the company and the municipality is granted, President D. G. Hamilton says that the traction company stands ready to expend nearly \$9,000,000 on the construction of a new plant and the purchase of an entire new equipment.

Frankfort, Ky.—An electric railway is to be constructed between here and Lawrenceburg, Ky. Surveyor A. C. Parker has completed a survey of the proposed route, together with an estimate of the cost.

Georgetown, Del.—There is talk of building an electric railway from Seaford to Bethany Beach, by way of this town.

Lexington, Ky.—The Lexington Railway Company has decided to add considerable machinery to its power plant, also to build an extension in the suburbs. R. L. Williams of Richmond, Va., is president of the company.

Monterey, Mex.—G. K. Wright of Chicago has been granted a concession for the construction of a system of electric street railways here.

Monticello, N. Y.—The Monticello, Fallsburg & White Lake Railroad has been organized to build a new sixteen-mile trolley road through Sullivan County, to carry passengers, freight and dairy and farm products between here, Fallsburg and White Lake.

New Coeln, Wis.—If citizens of this place meet certain conditions, the Milwaukee Street Railway Company will extend its Howell avenue car-line here, which is a distance of about two miles.

New York City.—The plans to connect this city and Philadelphia by trolley via Somerville, N. J., are fast progressing. The tracks of the Philadelphia & New Jersey Railroad and the Philadelphia & Bristol Railroad Company will be used. Heavy tracks will be laid. The single-trip fare between Philadelphia and this city will, it is stated, be \$1.

Philadelphia, Pa.—The stockholders of the Carbon County Electric Railway Company, of which I. A. Sweigard is president, recently voted to increase the present capital stock of \$60,000 to \$300,000. The increase will be used to improve the present line and to make extensions through Lehighton to Millport, and from Lehighton to Stroudsburg, and the Delaware Water Gap, the surveys of which have already been made and the right-of-way practically secured.

Port Clinton, O.—The Lakeside, Napoleon & Western Electric Railway was organized here last week by Eastern capital, and will run from Napoleon to Bowling Green and Fremont, thence to Port Clinton, Lakeside, Piccolo, and Marblehead. The route will be 50 miles in length.

Schenectady, N. Y.—The right-of-way has been secured for an electric road from here to Ballston where it will connect with the road to Saratoga.

Toledo, O.—The county commissioners recently granted J. L. Yost and F. V. Collins a franchise for an electric road on the Holland road to Delta.

Williamston, Mich.—The village council has granted a franchise for an electric railroad, which it is proposed to build from Detroit to Lansing.

Company Matters.

Indianapolis, Ind.—The Sanborn and Advance Electric Companies have been consolidated, and the obligations of both are assumed by the new company under the name of the Sanborn-Marsh Electric Company.

Manufacturing.

Adrian, Mich.—James Gilliland has completed negotiations with the American Electric Fuse Company and the American Specialty Company, both of Chicago, and both manufacturing electrical specialties. F. G. Jones is president, and the two plants will be moved here to be run in conjunction with the Gilliland Electric Company. The concerns have ample financial backing. Mr. Gilliland stated that the removal will be effected by May.

Newark, N. J.—The Electric Insulation Company, capitalized at \$400,000, will manufacture electric supplies. Elijah Woodward, C. H. S. Woodward and Louis A. Ziegler, all of this city, are connected with the concern.

Penn Yan, N. Y.—The manufacture of the device recently patented by Fred Carroll, of this place, for the automatic turning of switches on electric lines will shortly be begun.

Portland, Me.—The Safety Electric Switch Company, capitalized at \$150,000, proposes to manufacture, buy, sell and lease all kinds of machinery used in electricity. J. F. Fanning and A. C. Percy, Portland; A. C. Dresser, Standish; A. A. Bohn, H. A. Greenough and E. P. Hughes, Providence, R. I., are the promoters.

Trenton, N. J.—The Weber Self-Playing Piano Company has been formed lately for the purpose of manufacturing self-playing pianos to be operated by an electrical apparatus. Henry C. Holton, August Wartman, Adam J. Osterle, Wilmot L. Moorehouse and Joseph Weber are all interested in this enterprise, which is capitalized at \$200,000.

Utica, N. Y.—The Johnson & Morton Company has purchased property in this city, and as soon as the frost is out of the ground will begin the erection of a factory building for the manufacture of electrical supplies.

Power and Transmission.

Augusta, Me.—A. O. Lombard is now at work on the plans for a new log hauler, which will be run by electricity. This will necessitate the establishing of a power plant in the woods and the running of a trolley line, but it is believed that it can be done successfully and economically.

Halltown, W. Va.—A syndicate, of which ex-Governor Lloyd Lowndes, of Cumberland, Md., is interested, proposes to harness the Shenandoah River near here to generate for the lighting of the towns of Charlestown, Shepherdstown, Winchester, Martinsburg and Berryville, Va., and also to furnish motor power for any industries in said towns that may desire it.

Spokane, Wash.—The Big Bend Power Company was lately organized for the purpose of establishing plants for the generation of electricity for power, illuminating and other useful purposes. The capital stock is fixed at \$300,000. William E. Eldridge and William T. Stoll of Spokane, David Wilson of Davenport, Wash., C. A. Hamilton of New York City, and E. S. Miller of Jersey City are interested in the scheme.

Automobiles.

Amesbury, Mass.—A representative of a New York motor vehicle company has bought all the motor vehicle bodies now in stock in the local carriage factories, and has placed orders with the builders here amounting to \$500,000 for future shipment. The local firms will ship the bodies finished and trimmed, all ready to hang on the gear part. The firms will ship the orders as fast as turned out, and it is expected that the employees will be kept busy until July.

New Orleans, La.—G. Herbert Condict, of New York, consulting engineer for the Electric Vehicle Company of Hartford has recently been in this city looking over the field with a view of reporting to the company on the advisability of establishing a line of electric cabs and delivery wagons here.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 16½@17c.; casting, 16½@16¾c.

Thomas F. Ryan was elected a director of the Chicago Union Elevated Railroad Company on Saturday.

The Chicago City Railway Company has declared a dividend of 3 per cent. payable March 30. Books close March 14 and reopen March 22.

Stockholders of record on the books of the Columbus Edison Company to-day have the right to subscribe for 6¼ per cent. additional preferred stock at par. "Rights" expire March 15.

The Electric Storage Battery Company of Philadelphia has declared quarterly dividends of 1¼ per cent. each on its common and preferred stocks, payable April 1. Books close March 26 and reopen April 2.

The Chicago Telephone Company has declared the regular quarterly dividend of 3 per cent., payable March 30. Books close March 27 and reopen April 9.

A movement is said to be on foot for consolidating the independent telephone companies of Western Maryland, Pennsylvania, Virginia and West Virginia, and for establishing a long distance service to New York, Philadelphia and Baltimore.

The annual report of the General Electric Company will be ready about the middle of April. Directors will presumably meet for dividend early this month when it is expected they will declare something better than 2 per cent. for the quarter.

At the annual meeting on February 28 of the Chesapeake & Potomac Telephone Company, which operates in Washington, Baltimore and other Southern cities, the retiring board of directors was re-elected. No financial statement was issued.

At a special meeting of the stockholders of the New York & New Jersey Telephone Company in Brooklyn last Friday it was voted to increase the capital stock from \$8,000,000 to \$15,000,000. The new stock will be offered to present shareholders as it is needed for the improvements of the company.

A special meeting of the stockholders of the International Automobile & Vehicle Tire Company will be held at 243 Washington street, Jersey City, N. J., to-day to take action toward reducing the capital stock. It is proposed to reduce the preferred stock from \$1,500,000 to \$500,000, and of the common stock from \$1,500,000 to \$500,000. Stockholders will also consider the issue of mortgage or debenture bonds.

The annual meeting of the Canadian Bell Telephone Company was held at the head office of the Company at Montreal on the 28th of February. The item of particular interest in the annual report was the fact that an increase of capital, from \$5,000,000 to \$10,000,000, is contemplated. The present capital has all been issued and additional money is required for construction and general extensions. An additional bond issue of \$2,550,000 has also been authorized, and these bonds will be placed upon the market as the funds are required.

The Twin City Rapid Transit Company reports for the year ended December 31 last: Receipts—Passenger earnings, \$2,814,205; miscellaneous, \$25,151; total earnings, \$2,839,356. Expenses—Maintenance, way and structure, \$61,086; maintenance of equipment, \$159,835; operating power plant, \$170,662; car services, \$641,196; general expenses, \$156,472; legal expenses, \$23,000; injuries and damages, \$82,949; insurance, \$9,489; total operating expenses, \$1,304,689. Net earnings, \$1,534,667; interest and taxes, \$624,326. Balance, \$910,341; total dividends, \$655,050; surplus, \$255,291.

The report of the International Power Company for the year 1900 shows that there had been expended during the year in the development of the automobile truck and electric vehicle business \$55,100, from which no profits had been derived, but a very large and lucrative business is anticipated in orders already in prospect. The net surplus over current liabilities amounts to \$190,572, to which is added \$388,755 for betterments, etc., making the gross assets over all liabilities, \$579,327. The profit and loss account as of December 31, 1900, shows a total surplus of \$424,136.

The Lake Shore Electric Railway Company, of Cleveland, O., capital, \$4,000,000, has been formed by the consolidation of the Lorain and Cleveland, the Sandusky Interurban and the Sandusky & Norwalk Southern roads. By this deal a chain of electric roads will extend from Buffalo to Detroit, paralleling the Michigan and Lake Shore Railroad. The entire line will be completed this summer. The equipment of the road will be of the highest standard, and the cars will have a speed of fifty miles an hour over a seventy-pound rail. It is said that none of the stock will be put on the market.

There is some doubt in the minds of the stockholders of the Westinghouse Electric Company as to the manner in which the \$10,000,000 of new stock issue will be allotted. It was felt that the stockholders would be given the privilege of subscribing for the new stock at par, but from the statement made subsequent to the meeting it appears that there is no such intention on the part of the management. The statement in reference to the stock issue is as follows: "To meet the already increased capital requirements of the company, which cannot be cared for from the earnings without hardship to the stockholders, \$3,000,000 of stock, sold at the best possible price, but not less than par, will suffice." As yet the Westinghouse Company has not published the terms of the issue, and the stockholders are anxiously awaiting these terms. In connection with this matter George Westinghouse, president of the company, makes this statement: "If some stockholders should be surprised that more complete statements have not been previously submitted to them, it can only be said that the directors, as well as the stockholders who own the largest amounts of stock, have believed that in view of the existing keen competition and the general attitude toward industrial enterprises, the interests of all would be served by avoiding, to as great an extent as possible, giving undue publicity to the affairs of the company."

ELECTRICITY.

VOL. XX.

NEW YORK, MARCH 13, 1901.

NO. 10.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4091 Cortlandt.

SUBSCRIPTION RATES:

EDITORIAL NOTES.

The Brooklyn Transit Problem.

It is only necessary to be
unfortunate enough to
have to cross from Man-
hattan Island to Brook-
lyn by way of the bridge during the so-called
rush hours to have it most forcibly impressed
upon one the great need of better transit
facilities.

When the great football games between the
leading colleges were played on Manhattan
Field a few years ago the crowds that had to
be handled were something enormous and
taxed to the utmost the carrying capacity of
the elevated roads, yet this condition of affairs
had only to be met once or twice during the
autumn, whereas the mass of workers who
travel to and from their Brooklyn homes by
way of the bridge, has to be handled twice a
day. The only surprising thing is that, under
the circumstances, very serious accidents have
not occurred.

That something will have to be done to
alleviate this congestion of traffic is only too
apparent, and the position that the Chamber
of Commerce has taken is therefore a most
laudable one. Referring to this subject former
Mayor Abram S. Hewitt in an interview says:

"I imagine that what the Chamber of Com-
merce wishes to bring about is a pressure of
public opinion, which will force the authori-
ties at the City Hall to take some action.
There is usually an apathy at the City Hall
which leads those in power to do nothing until
they are forced to act.

"What I suppose is needed at the bridge is
more terminal facilities. That has always
been the case there—partly, I suppose, because
the city was unwilling to pay the price to get
the land."

That better terminal facilities are sorely
needed goes without saying, but what is also
needed is a tunnel under the East River to
Brooklyn.

When the Brooklyn Bridge was first built
the population of Brooklyn was in the neigh-
borhood of 600,000, whereas to-day this figure
has risen to almost 1,200,000. In the same way
the population of Manhattan Borough has in-
creased from 1,000,000 to over 2,000,000. As a
well known writer aptly puts it, the people
have outgrown their bridge, and something
therefore ought to be done. London is admit-
tedly behind New York in many things, but
not in its means for transportation from one

portion of the city to another. The River
Thames, for instance, is spanned by fourteen
street bridges, and in addition has under its
bed four street railways, two operated by elec-
tricity. Against this, progressive New York
has but one bridge to Brooklyn—although it is
true another is in course of construction—and
several antiquated ferry-boats by means of
which almost 100,000 persons are expected to
journey to and from their places of business
and homes in the short space of a couple of
hours. The new East River Bridge when com-
pleted will probably improve the situation
somewhat, but at best but slightly, as it is too
far up-town to relieve the Brooklyn Bridge to
any great extent. What is needed is a tunnel
under the East River to connect with the un-
derground rapid transit system now in course
of construction, and it is to be hoped that the
Rapid Transit Commission will be empowered
to order its construction.

* * *

An Invention for Testing Thermostats.

At the present day in-
numerable buildings are
equipped with ther-
mostats, which give an
alarm usually by the

ringing of a bell, when the temperature rises
above a certain point. There are various
types of thermostats which operate on dif-
ferent principles, although in every case an
electric circuit is completed, usually when the
temperature rises forty degrees Fahrenheit
above the maximum temperature of the
premises. In the early days of thermostats the
principle in which they were made to operate
was through the expansion of metals. For in-
stance, the rise in temperature to a predeter-
mined degree would cause the free end of a
spring to move by expansion and come in con-
tact with a screw point, thereby closing an
electric circuit. Among other principles
made use of in the construction of thermostats
are those employing volatile fluids, fusible
solder and mercury. The last named type is
probably made use of to a greater extent than
any other, and much resembles in general ap-
pearance a thermometer, excepting that at a
given point above the mercury is placed metal-
lic points connected with one pole of a battery
while the mercury itself is connected to the
other pole. Thus when the mercury rises in
the tube and touches the points, the circuit is
completed and the alarm sounded. Heretofore
it has been more or less of a difficult matter to
test these thermostats in order to ascertain if

they are in working order. With a view to facilitating this work an English engineer by the name of Heaphy has perfected a system whereby a source of heat is provided at the thermostat. For this purpose, according to the London "Electrical Engineer," a third wire is run from the indicator board to each thermostat in a building. This wire ends in a coil of high resistance material placed near the bulb of the thermostat. At the indicator board a multiple-way switch enables a six-volt battery to send a current to the resistance coil of any thermostat. The resistance of the circuit is such that the resistance wire is heated only slightly above the temperature at which an alarm is given. With the apparatus in question it only takes about half a minute for the current to bring the mercury in any thermostat up to the alarm temperature, and to complete the circuit. Commenting on the invention our contemporary says:

"We think the idea is an exceedingly good one, and there should be absolutely no difficulty in making the details exceedingly durable. The great advantage of the apparatus is that it not only proves that the mercury contacts within the thermostats are working satisfactorily, but that the wires from the thermostat to the indicator board and alarm bell are also in good condition."

* * *

American Capital in England.

It seems strange that London, the money center of the world, should require American capital to give it up-to-date rapid transit. Such, however, seems to be the case and, according to the N. Y. "Herald," Albert L. Johnson, brother of Tom L. Johnson of street railway fame, is endeavoring to put through two transit projects for the English metropolis, involving respectively \$15,000,000 and \$7,500,000 of American capital.

One of the projects, the first named, is that of the Baker street underground road, which is to run from the Elephant and Castle, in London, to Paddington Station, and be about six miles long. The other plan is for an underground road near the Bank of England to St. George's Circus, which is not far from the Elephant and Castle.

Mr. Johnson, who is now in this city, in a recent interview is reported as saying:

"The franchise for the Baker street road, was one of the assets of the London and Globe Finance Corporation, and the directors some time ago let me have an option on the franchise and the portion of the road which they have built. This option expired one day last week and I have had it renewed for sixty days.

"A syndicate consisting of some of the strongest financial interests of this city, has been formed and is ready to put in the necessary money. My partner, former Representative Benjamin Cable, of Illinois, is now in London looking after our interests, and will probably sail for this country in a few days. When completed, the route will represent a total investment of about \$15,000,000 of capital.

"The starting point of this route is the Elephant and Castle. Thence the road will run northwest to Waterloo Station and under the Thames in the neighborhood of the Charing Cross rail and foot bridge, and then to Charing Cross Station. At the Strand it will turn under

Trafalgar Square and Pall Mall to the Haymarket.

"It will run under the Haymarket to Piccadilly Circus, then under the Quadrant and Regent street, in which the fashionable retail shops are located, and under Langham Place and Portland Place, northwest to Marylebone Road, crossing Baker street, and run as far as the Paddington station, passing Edgware Road Station on the way.

"At one terminus—the Elephant and Castle—we connect with many horse car lines. At the other terminus—Paddington Station—we connect with several steam railway lines. If the horse cars are ever replaced by trolley cars we may tie them up into trains of five cars each at the Elephant and Castle and send them through the tube to Paddington. The route should get all the theater traffic, and carry an army of shoppers and of clerks going to and from their work.

"There are to be two tubes, each eleven and a half feet in diameter. The London and Globe has already completed one of these tubes and has put in several sections of the other. We plan to use electric cars, and carry passengers for twopence a fare. Our stations, besides the terminals, will be at Waterloo Station, Charing Cross, Piccadilly Circus, at Oxford Circus, Baker street and Edgware Road.

"That is one road. Now, I have just received final advices to the effect that I can purchase an option for another underground route from the neighborhood of the Bank of England, in Threadneedle street, S. W., under the Thames just west of the London Bridge to a place called St. George's Circus, which is a very short distance from the section of the other route from the Elephant and Castle to Waterloo Station.

"To purchase this franchise and build the road would cost about \$7,500,000. If we do it we shall aim to get the right to connect both routes below St. George's Circus. The original plan of this second route was to extend it out about four miles beyond St. George's Circus in the direction of Brighton."

It is understood that Mr. Johnson is working independently of Mr. Yerkes, whose underground road however also touches at Charing Cross. If both of these gentlemen succeed in carrying out their ideas and plans, it would seem as though the rapid transit systems of London would be pretty well under American control. No wonder England and European countries are startled by what has been termed American trade and financial invasion!

SANTOS DUMONT is busily conducting experiments with a new airship at Nice, France. He says that he has already built and tried two machines, but neither of them obtained that measure of success for which he hoped. This year the young aeronaut has had a much more powerful machine constructed. The balloon itself is cigar-shaped and is made of the strongest silk. Underneath is suspended the machinery, which rests upon a long and very stout bamboo. The aeronaut sits in the center on a bicycle saddle and pedals the machine bicycle fashion. In front of him is a wheel by turning which he manoeuvres the aluminum screw placed in the front of the machine. As in many other inventions of this nature the motive power is electricity generated by the pedaling, storage batteries being located in front of the steering wheel.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE auditorium and drawing rooms of the University of Wisconsin will shortly be lighted by electricity with lamps so placed as to be invisible to persons in the rooms. This is the result of interesting experiments. The lamps will be arranged around the sides of the rooms with opaque reflectors to project the light evenly over dead white ceilings. The ceilings will reflect the light through the rooms, thus furnishing a reflected light of uniform intensity everywhere in the rooms.

It is reported that Signor Marconi is to undertake important electrical experiments in the United States. In an interview last week before he left Liverpool he said his journey had nothing to do with any attempt to establish wireless telegraphy across the Atlantic, but admitted, however, that he expected to meet officials of the Bureau of Equipment of the United States Navy, and that the meeting would perhaps result in some experiments on an American warship.

A DISPATCH from Cleveland, O., says that a funeral procession of trolley cars moved through the East End streets Sunday afternoon, bearing the body of Frank A. Heinline, the dead paymaster of the Consolidated Railway Company, to the Lake View Cemetery. The dispatch says it was in many respects the most remarkable funeral that city has ever seen.

CHRISTOPHER LYMAN MAGEE died at his home in Pittsburg, Pa., last Friday afternoon. Mr. Magee represented Pittsburg in the Pennsylvania Senate and was president of the Consolidated Traction Company of Pittsburg. He was 53 years old and before his illness he had his life insured in favor of his wife for one million dollars.

THOMAS A. EDISON's representative was in Buffalo, N. Y., recently arranging for space to make an exhibit of electrical novelties at the Pan-American Exposition. The display will be made in the Electricity Building and will show all of the recent inventions of Mr. Edison.

FARMERS in the country adjacent to Chicago are taking up the automobile fad. Orders received from rustic purchasers indicate that the country roads in Illinois and Wisconsin this summer will be filled with horseless vehicles.

IN recognition of his achievements in ocean telephony the Columbia University trustees of this city recently promoted Michael Idvorsky Pupin, formerly adjunct professor of mechanics, to a full professorship in electro-mechanics. The office was created especially for him. President Seth Low announced he had selected Prof. Pupin to represent Columbia at the celebration of the 450th anniversary of the University of Glasgow in June.

ELECTRICAL power continues to supersede other power for the operations of yards and works, says an English contemporary. One of the most useful and convenient applications of electricity has been in drilling. Mr. T. Anderson, M. I., M. E., of Liverpool, England, some-

time ago invented a portable drilling machine for electrical power, which has come into large use. The advantages of the machine are its convenience and the speed with which boring is done when the machine is in position. Holes of any size can be drilled or enlarged by the use of it, though the work to be bored be in difficult and almost inaccessible places, such as the tunnels of propeller shafts or in confined engine rooms. Some remarkable boring has recently been done with Anderson's patent boring bar, the appliance for heavy work. Among other things cylinders in position in the White Star steamers Oceanic and Majestic have been bored out by means of it.

PLANS for the conversazione of the American Institute of Electrical Engineers, to be held at Columbia University on April 12, are being developed very vigorously by the committee in charge, and a number of novel and interesting exhibits are promised, as well as some of the first importance. While the affair will be scientific in character, the lighter social side will not be neglected, as provision has already been made for music, collation, etc. The most encouraging feature next to the active interest shown by the members is the desire evinced by prominent inventors and the leading electrical companies to contribute items of intrinsic merit to the list of attractions, and it has been found necessary to impose a limit both as to space and as to time of entry. Lecture rooms 301 and 302, in the Electrical Engineering Department, will be occupied, as well as 306 and 308 in the Mechanical Engineering Department. The elevators will be in service and cloak and dressing rooms provided on the upper floors. It has been decided by the Council and Committee to issue gratis to each member a ticket for himself and lady, on application, and a limited number of extra tickets at \$1 each. Invitations will be extended to a select list of guests.

A PLAN has been submitted in Kansas City, Mo., to equip the police with electric dark lanterns. The lamp contains a storage battery and is attached to the policeman's hat.

THE Bossert Electrical Construction Company recently shipped to the new United States Mint at Philadelphia one of the largest isolated electrical switchboards ever manufactured. The switchboard is entirely constructed of marble, copper and steel, and is 6 feet high and 36 feet long. There are 18 slabs of pink Tennessee marble, each 1½ inches thick. There are 42 double and triple pole switches, which range from 100 to 1,600 amperes. There are 78 circuit breakers and many meters, all of which combine to make the board an example of mechanical construction. The copper required to connect the generators or dynamos with different switches and current breakers weighs over two tons and the board complete as it will stand weighs ten tons. The board will carry 5,000 amperes at 110 volts, equal to 10,000 sixteen candle power lights. The switches have been arranged so that each will turn on either light or power, as may be desired. This was necessary, as there will be no other power aside from electricity used in the new Mint Building.

THE Rapid Transit Commissioners met March 7th in this city and appointed Dr. Louis Duncan and Cary T. Hutchinson as electrical

experts to assist Chief Engineer Parsons. These two engineers will have charge of all the electrical work to be done in the tunnel. Heins and La Farge were appointed advising architects to assist Chief Engineer Parsons in designing all the stations needed on the Rapid Transit routes.

ACCORDING to the "Elektrotechnische Zeitschrift," at the end of the past year there were in operation in Germany about 1,900 miles of electric railways, having a total length of track of 2,800 miles, as compared with 1,430 miles and 1,980 miles respectively for the previous year. The rest of the figures given are only up to September 1, 1900, when the aggregate output of the generators installed for working 2,660 miles of track amounted to 75,608 kw. as compared with 52,509 kw. for 1,760 miles of track in the previous year, or an increase of 44 per cent. On the other hand, the number of station batteries installed up to the same date showed an increase of only about 25 per cent., as against 164 per cent. for the previous year, the total capacity of the accumulators amounting to 16,890, compared with 13,532 kw. on September 1, 1899.

A HARTFORD, CONN., inventor has brought out a call box telephone, which resembles in general appearance a fire alarm box. The door can be unlocked by dropping a cent in a slot. Inside the box is the mechanical pay station telephone with slots for dimes and nickels.

THE old gas lamps along the Victoria Embankment in London have been replaced by modern electric arc lights. The total number of lamps to be erected under the present scheme is 147, of which 67 are on the parapets, and 80 on the kerbs and on Westminster Bridge. The former only are as yet installed. The lamps are all of the long-burning open type, the parapet lamps burning 40 hours without re-trimming, while those which are to be erected on standards along the kerb will run for 60 to 80 hours without attention. The parapet lamps are in series of 10, taking 6 amperes; it is said to be the first time that such small current arc lamps have been successfully used for public lighting in this manner. The kerb lamps will be of the 12-ampere type, containing 6 feet of carbon, and are to be arranged to lower for trimming. Although such a great length of carbon is used, the lamp is only the same length as the arc lamps now generally in use.

PROF. FESSENDEN, the Weather Bureau's wireless telegraphy expert, has been on the North Carolina coast, where he erected stations between Roanoke Island and Hatteras. The tests so far have been entirely satisfactory, and he has gone to Washington to report in person to Chief Willis Moore. It is proposed to erect stations at Cape Henry and Norfolk, so that weather reports can be disseminated to ships at sea, which, in case of approaching storms, would greatly lessen the danger of ships being driven ashore at dangerous Hatteras.

EXPERIMENTS with Becquerel rays are being conducted in great secrecy at Berlin, according to a communication received at the State Department from Consul-General Guenther at Frankfort, Germany. These experiments are said to have disclosed the fact that an entirely new element is responsible for the Becquerel

rays, and that they render almost every transparent substance luminous in the darkness. Consul-General Guenther says that the rays make it possible to tell genuine diamonds from artificial ones in the dark, which would prove of great practical importance in testing. The experiments, it is said, also have demonstrated that rays emanating from a large quantity of the new element make the air such a conductor of electricity as to promise that the property can be utilized in wireless telegraphy. The results of the experiments, it is said, will be laid before Emperor William, "which," says the Consul-General, "seems to indicate that the discovery is regarded as one of great importance."

Mr. J. B. Charleson, who is superintending for the Dominion Government the construction of the all-Canadian telegraph line to the Yukon district, has arrived in Vancouver, B. C., with his party, and will start at once to exploit a route for 100 miles of telegraph between Fort Simpson and Hazelton. The line is regarded as of the greatest importance, as it will place the large fleet of northern vessels, passing Fort Simpson, in telegraphic communication with the outside world, as well as all the northern canneries, and wrecks and casualties will thus be reported promptly.

Card From the Ericsson Telephone Company.

Editor ELECTRICITY.

SIR: The attention of the writer was called to a little note in your issue of February 6 with relation to the Syracuse, N. Y., exchange of the Syracuse Telephone Company. While appreciating the reference made therein to the telephones used by the Syracuse Telephone Company as a type of the L. M. Ericsson telephone of Stockholm, we wish to say that you do us too much honor, as the instruments are neither the L. M. Ericsson make or our make, but are what we consider a rank imitation. The switchboard is not even an imitation of the Ericsson switchboard.

In this connection it might be just for us to say that the goods made by L. M. Ericsson & Co., Stockholm, Sweden, have been sold outright for nearly a quarter of a century, and they stand on their merits and hold their own in the markets of the world solely because of their superiority. It is not strange that imitations of such superior goods are sold, and not only sold but are sometimes confounded with the genuine by those who do not know the difference. Would merely say that the supreme test of all things, good or bad, is "time," and whether the goods are the genuine or the imitation we are quite willing to have time and use prove. Very truly yours,

ERICSSON TELEPHONE COMPANY.

Francis O. Matthiessen.

Mr. F. O. Matthiessen died in Paris, France, on March 8. Francis O. Matthiessen was born December 23, 1833, in the Dutchy of Holstein, Germany, and was educated in the City of Altona, near Hamburg. He came to this country when about 26 years old, and engaged in the sugar refining business. Mr. Matthiessen at the time of his death was interested in a number of enterprises, such as the Goubert Manufacturing Company, the North Jersey Street Railway Company, and the Weston Electrical Instrument Company of Newark, N. J., of which he was president.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 18.

HINTS FOR THE DYNAMO TENDER.

An attendant for electrical machinery should understand the elementary principles of electricity, the units of measurement and how to apply them, the laws and phenomena of induction, the principle involved in the different styles of dynamos, and have an intelligent knowledge of the electrical science in all its branches.

The following consists of suggestions covering some of the more important features with which a dynamo attendant should be familiar.

CLEANLINESS I place first in the list, for I believe it is the most important feature in the operation of a central station. What a story the appearance of a dynamo room and the machines tell to the close observer.

It is unnecessary to comment, to any length, on this point, because the fact has been so well established, that the greatest enemy to the successful operation of electrical machinery is dirt. The fact that a generator may be nicely painted and well finished does not increase its efficiency, but it certainly will act as an incentive for the operator to keep it clean and of a good appearance, and that of itself is of considerable importance.

Machines should always be cleaned immediately after they are shut down. Better results can be accomplished then than if allowed to cool, as it is then much more difficult to remove the oil and grit.

If convenient a suitable canvas cover should be provided and placed over a machine after it has been cleaned to prevent dust settling on it.

INSTALLATION.—The location selected for the placing of a dynamo should be cool and dry and in such a position if possible that the machine will be easily accessible on all sides. Do not place it in such a way that it would be impossible to remove the armature without moving the entire machine. This is a mistake that is often thoughtlessly made. In placing dynamos of considerable size, a foundation of brick or stone should be provided, constructed if possible separate from the walls of the building. In any case a level and firm foundation ought to be provided.

In placing the parts of a machine together and mounting the apparatus the greatest possible care should be taken to thoroughly clean each part and all connections. The shaft and bearings must be thoroughly wiped before putting the armature in place.

BELTING.—The kind of belting to be used is to a great extent a matter of opinion. The standard light weight, double leather belt is however applicable in most cases and as a general rule satisfactory. Use endless belts by all means as it is not advisable to operate a high speed machine of any description by laced belts.

In estimating the size of belt required to do a certain amount of work, it may be taken as a guide that a single belt will transmit approximately one hp. for each inch in width when

running at a speed of 1,000 feet per minute. If the speed is greater, the power transmitted will be correspondingly increased, and if it be less the power will be correspondingly decreased.

Always operate a leather belt with the smooth surface next the pulleys and the slack (running) side on top if possible.

On new belts an allowance for stretching should be made, in placing the machine, of $\frac{1}{4}$ of an inch to the foot in its length. In calculating for speed it is advisable to allow one per cent. for slipping, as it is certain to occur to this extent when doing work. Endless belts can be made without the use of rivets; use specially prepared cement for splicing and avoid the use of rivets.

DIRECTIONS FOR STARTING.—Make a careful examination of the entire machine to see if the connections are all right and also to make sure that no tools have been left carelessly lying about. This sort of an examination becomes a second nature to attendants who have been operating machines for some time and they unconsciously perform this very important proceeding without thinking that they are doing it. Note if the brushes are all set and have the proper tension. It is often customary to bring dynamos to their full speed before lowering the brushes into contact with the commutator. This is not at all necessary, in fact it is much better to place and set all the brushes before starting at all unless there is some danger of the machine being turned backwards, which would injure copper brushes. The main switch connecting a dynamo into the circuit should not be thrown in until the dynamo is "built up," that is, operating at the required voltage indicated by a voltmeter or pilot lamp; however this does not apply if a dynamo is operating an independent circuit, for then it does no harm to have the circuit on and allow it to build up with the machine. Never throw a heavy load on a generator suddenly if it can possibly be avoided, but gradually build up its load by means of circuit switches, or if operating in multiple with other machines, the shifting of the load should be done gradually.

DIRECTIONS FOR RUNNING.—If a machine is new and is being run for the first time, special attention should be paid to it for a while, and for a short time it is advisable to run it at less than full load if at all convenient to do so. Fresh oil should be added to the bearings quite often and the old run off. Be on the alert for excessive heating of the bearings, field coils or armature, and if any is discovered no time should be lost in finding the cause and applying a remedy.

Excessive heating of the armature can be discovered while a machine is running by placing the hand in the current of air that is set in motion by its force.

Special care should be taken in handling generators which are operating at an EMF. of 500 volts or over. "Keep one hand in your pocket" is an old saying; however this is not always convenient to do, but it serves to illustrate the impression we wish to convey.

Do not overload a dynamo, as this is the direct cause of probably as much trouble as any other individual thing.

Keep all iron or steel tools away as they might be drawn into the machine by the magnetism and be the cause of entirely ruining it. Copper or brass oil cans should be used for this same reason.

DIRECTIONS FOR STOPPING.—If a generator

is operating in parallel with others gradually remove the load until its ammeter indicates little or no current, then open the switch. Under no circumstances allow the speed to be lowered or the magnetism weakened (except enough to regulate the EMF.) before disconnecting. If this were done the machine would probably run as a motor, taking its current from the main circuit, which might cause no end of damage.

If a machine is operating alone on a circuit, gradually decrease the speed and allow it to stop without touching either the brushes or switches. Do not switch out a dynamo at full or partial load except in a case of emergency.

Never lift a brush while a dynamo is generating current, except when there are other brushes on the same side to remain in contact.

As soon as a dynamo is "shut-down" clean it thoroughly and raise the brushes, taking care to wipe all the copper dust from the commutator, brushes and brush-holders, after which it should be covered, if a cover is provided.

SPARKING AT BRUSHES.—The causes resulting in this trouble are very different in different types of machines. Most all arc dynamos spark considerable while operating, but that is not objectionable as they are designed to stand it.

A few of the more common causes of this trouble in direct current multiple machines are brushes not set at the neutral point, current overload, rough commutator, open coil in armature, short circuited coil, leak from coil to frame, weak or uneven magnetism, bad brushes or unnecessary vibration of the machine.

If the sparking occurs from the brushes not being set at the neutral point it can be readily overcome by shifting the rocker arm either backwards or forwards until the neutral or non-sparking point is found.

An overload will produce sparking as probably the capacity of the commutator and brushes may not be sufficient, and in this case there is no remedy except to reduce the load.

It is not a difficult matter to keep a commutator, which has no inherent defects, in good condition if attended to properly from the start; but if allowed to get rough and full of ridges it takes considerable care and work to bring it right. It is very damaging to a machine to run it with the commutator in bad condition.

An open coil can be detected by a spark that will appear to travel almost around the commutator. The defective coil can be found by noticing which plate is most damaged by the spark. If there is not time to repair it the dynamo may be operated for a short while without damage by connecting the two plates together between which the open coil exists. An open very seldom occurs in the coil itself but more generally where the wire is connected to the commutator plate. This is easily found and remedied.

A short-circuited coil will heat much more than any of the others and is very liable to burn out entirely. It may be detected by holding a piece of iron between the pole pieces and in such a way that it will be influenced by the magnetism, and if the pull varies suddenly at a point in each revolution it demonstrates that a defective coil exists. Of course this test must be made while the machine is generating current.

A leak from the windings to the frame may

be detected by testing with a magneto bell or by the use of a battery and telephone receiver.

Weak or uneven magnetism will cause sparking and also result in the dynamo not generating its full EMF. when running at the required speed.

The brushes should set on the commutator in such a way that the intended contact surface shall all be in contact, and also they should have no ragged edges but ought to be kept properly trimmed.

It may be said that excessive heat exists if the armature or field coils get too hot to keep the hand on for a short time.

Article No. 19 will be entitled "Rules, Tables, and Formulae."

[NOTE.—In the future an article will be devoted to explaining how to test for trouble in dynamos.]

IV.—POLYPHASE ELECTRIC RAILWAYS IN EUROPE.

BY FRANK C. PERKINS.

Stansstadt-Engelberg Three-Phase Railway.

The three-phase adhesion and rack railway operated between Stansstadt and Engelberg is of interest to the reader in connection with the preceding polyphase roads, described during the last month in *ELECTRICITY*. The highest potential used on any of the roads was that be-

FIG. 1.—SUB-STATION AND FEEDER CONNECTIONS FOR STEP-DOWN TRANSFORMERS ON POLYPHASE ELECTRIC RAILWAY.

tween Burgdorf and Thun, described and illustrated in the second serial on February 27, pages 122-124, No. 8 of *ELECTRICITY*. The high potential of 16,000 volts was used upon the transmission line, the working contact line using however only 750 volts. In obtaining this high potential step-up transformers were required as the generators only supplied a three-phase current of 4,000 volts potential directly from the armatures.

While the potential of the power transmission line on the Jungfrau Polyphase Railway was not as high as on the Burgdorf-Thun Railway still it was high enough for economy and has one advantage worth considering. The

high tension used is generated directly by the machines without the use of step-up transformers and cheapening the first cost of the road by that amount, as well as the loss in operation of those static transformers. Against this, however, must be figured the additional saving on account of the use of 16,000 volts as against 7,000 volts, the former potential being perfectly feasible with the step-up transformers. This polyphase road was fully illustrated and described in the third serial, on March 6, pages 137-139 of No. 9 of *ELECTRICITY*. Step-down transformers are necessary in any of the designs, and these are usually placed in sub-stations at various points on the route.

A diagram is shown in Fig. 1 of the connections for the step-down transformers used on the Jungfrau line and the connections to the

cars are longer than the locomotives, as will be seen in the one above on the track. Each car is fitted with two motors of about 35 horse power each. There are in operation on this line 8 of these motor cars and three locomotives. The locomotives are equipped with three-phase motors, as shown in illustration, Fig. 3. Each motor has a capacity of 75 horse power making the total capacity of the locomotive 150 hp. The working potential used on the contact line is 750 volts.

The Outlook for Copper.

The consumption of copper during the year 1900 has been abnormally large, and shows a great increase over that of the previous year. In England the increase has been nearly 21,000

FIG. 2.—STANSSTADT-ENGELBERG POLYPHASE ELECTRIC RAILWAY.

feeders and contact conductors which supply the low tension current to the locomotives. Two overhead trolley wires are always necessary, the track acting as the third conductor.

The electrical equipment of the Jungfrau Railway was supplied by the Maschinenfabrik Oerlikon and the firm of Brown, Boveri & Cie, while that of the Stansstadt-Engelberg Road was installed by the latter firm.

This polyphase railway is 22½ kilometers long and is equipped with three-phase motor cars as well as three-phase locomotives.

The energy for operating this road is obtained from a water power near at hand. The generating station is supplied with turbines and generators of a total capacity of 600 horse power. The turbine plant consists of three horizontal wheels of a capacity of 200 horse power each. The alternators are directly connected to these wheels and are of the three-phase type built by Brown, Boveri & Cie and previously illustrated in one of the former serials.

The gradient on this road as well as those already described is very great, as will be noted by the illustration, Fig. 2, showing a train on a steep grade. This view gives a very good idea of the type of motor car used and the style of the polyphase locomotive operated on most of these lines. The polyphase motor

tons, and in Germany 15,000 tons, while Italy, Austria and Russia have taken 4,000 tons more from the United States than in 1899. The total European increase is about 38,500 tons, and it would appear from the statistics supplied that American consumption has increased 23,500 tons (that of 1899 over 1898 having increased 52,000 tons), making the total increase of Europe and the United States about 62,000 tons. This is mainly due to the development in the use of electricity, especially for traction and power purposes. The requirements for ammunition have also been exceptionally large; while the manufacture of sulphate has absorbed considerable.

Exports from Europe have diminished 20,215 tons, but from the United States they have increased 42,334 tons.

Production has increased 18,640 tons, or 7.3-16 per cent., in the United States, and the import into the United States about 7,500 tons, chiefly from Canada and Mexico. Supplies to Europe, exclusive of the United States, have decreased 690 tons, or one-half per cent. The total increase of production on the North American continent is about 25,500 tons.

The public stocks in England and France have increased 6,918 tons during the twelve months; but if the returns of stocks in the United States at the end of 1899 and 1900 re-

spectively are correct, American stocks have decreased 24,608 tons, making the total reduction in English, French and American stocks 17,690 tons, which represents the extent to which it would appear that consumption has exceeded production. That consumption is likely to continue large during the present year appears most probable. A contract has already been concluded for the Pacific cable of 8,800 miles, and the French and other Governments propose to largely extend their cable connections. Electric tramways and lighting are ex-

A PROPOSED ELECTRIC CONDUIT RAILWAY FOR LONDON.

An electric conduit street railway is about to be built in London, a short length of the proposed line having been recently constructed and inspected by electrical engineers and other persons interested. For the following description and criticism of the system we are indebted to the "Electrician," London. The system was devised by the London County Council's engineers for use on the routes between West-

FIG 3.—THREE-PHASE LOCOMOTIVE ON STANSSTADT-ENGELBERG ELECTRIC RAILWAY.

tending in all the large towns and their suburbs; the use of telephones is increasing, while the necessity for more telegraph wires is apparent; and steam is being steadily supplanted by electric current for power purposes. The use of sulphate for combating vine and potato disease is on the increase, fully 25,000 tons of copper being consumed annually for this purpose. For steamships, marine engines and locomotives the demand promises to be good; considerable quantities will be required for ammunition, and India is expected to take more than during recent years.

Whether production will keep pace with the promised increase in consumption seems doubtful. Except in Canada, Mexico and Australia no new mines of much importance are being opened up, or are likely to be large producers for some time to come. The older mines show no signs of much increase, the increase in the production of the United States coming from the smaller mines. The Spanish and Portuguese mines do not materially increase, and the same may be said of the Cape mines and Boleo, the official returns made of the output of the principal mines under European management showing practically no change. Japan, however, may send larger supplies to Europe, and some further increase may be expected from Peru.—"Mining Reporter," Denver.

ELECTRIC street railways have been instituted at last at Cardiff, Wales, Mannheim, Germany, and in Auckland, New Zealand, according to the United States Consuls at those points, in reports to the Department of State at Washington. A modern service of this sort already has been put into operation at Mannheim, and a New York concern is arranging to build the road in Auckland at a cost of about a million dollars. The innovation at Cardiff is hailed with delight.

minster Bridge and Tooting, Kensington Gates and Blackfriars Road, St. George's Circus and Waterloo Road. Continuous current will be supplied at 500 volts from the generating station at Camberwell Green and from a sub-station at the Balham depot. The cars are to be double-decked on bogies, similar to that

FIG. 1.—GENERAL VIEW OF PROPOSED LONDON COUNTY COUNCIL CONDUIT.

shown in operation on the Westinghouse track recently. The seating capacity is to be 64 to 70, and the speed within a 4 miles radius of Charing Cross, is to be 10 miles an hour. In accordance with the London County Council's Act of 1900, a description and drawings have been submitted to the Board of Trade for approval, and also to the metropolitan boroughs of Lambeth, Southwark, and Wandsworth. The last-named borough suggested some modifications, and these having been made, has intimated to the Board of Trade its approval of the system. The other road authorities have been informed of these modifications, and it is expected that they also will signify their approval.

Fig. 1 gives a general view of the conduit,

and Figs. 2, 3 and 4 are line drawings, showing sections through the insulator pit, through the concrete tube, and across the cast-iron yoke respectively. The tramways will be double track throughout, the gauge being 4 feet 8½ inches, and the track rails, of steel girder section, weighing 102 lbs. per yard, will be laid in the same position as those which now exist. The slot rails are of steel, Z section, weighing 50 lbs. per yard, with a drip lip along the inner edge of the slot. The width across the heads of the two rails will be 4½ inches. The rails are bolted to the yoke jaws, and further fixed by wooden wedges, the width of the slot being kept as near ½ inch as possible.

The conductors are two in number, of soft steel tees weighing 23 lbs. per yard, and carried on insulator supports at 15 feet intervals, the supports being arranged midway between the yokes (see Fig. 1). The insulators are of glazed brown earthenware, with double petticoat (see Fig. 5), mounted on cast-iron stems, which are cemented into the concrete. The curved brackets down to the conductor rails are of gun-metal, and the insulators are fixed by a nut and washer at the top of the stem, leather washers being provided to pinch against. A bell-shaped pot cover is placed over all to deflect any drippings clear of the insulator.

The cast-iron yokes are spaced 5 feet apart, the depth from the top of the slot rail to the bottom of conduit tube being 1 foot 9½ inches, and to the base of the yoke where it bears on the concrete 2 feet 1½ inch. The greatest width of the yoke measured across the track is 26 inches, and the section at the bottom is as shown in Fig. 6. The conduit tube is of concrete.

The covers over the insulator pits give an opening 1 foot square, and will be filled in with artificial granite, or whatever material is used as paving between the track rails.

Wherever the conduit is drained, a larger box

with opening 19 inches by 12 inches gives access to both insulator and drain pit, and a similar size of box will be employed wherever a section insulator is used, the conductor tees being divided into lengths of about half-a-mile.

Having now described the proposed conduit, we feel it our duty to criticise it, and we may say at once that, unfortunately, the remarks we have to make will be mainly of an adverse nature. There has been more trial and error in electrical conduit design than with anything else in connection with electric traction, and those conduits which are now successfully at work in Washington, New York, Paris, and elsewhere are the outcome of an immense amount of actual experience. It seems a pity,

therefore, that the designers of the London County Council conduit should have departed so considerably from what has almost come to be considered the standard method of laying such tracks. Dearly bought experience has proved that, before all else, every legitimate effort should be taken to prevent the closing in of the slot from lateral pressure due to traffic, changes of temperature, etc. This has

FIG. 2.

Section through Insulator Pit and Road Box.

been effected in central slot conduits now successfully running electrically by extending the yoke outwards to the bases of the track rails, and so rigidly connecting the whole together that widespread settling or spreading of track rails and conduits is entirely prevented. Of course, if the yoke stands by itself, as in the case of the Brussels conduit* for example, where the slot is in one of the track rails, then the yoke-casting must be made extra strong to withstand the pressure. This is the condition of the London County Council conduit, except that it is midway on the track, and yet we find that the dimensions of the yoke-casting are smallest where one would have expected them

FIG. 3.

Section through Concrete Tube.

to be greatest. Thus, from Fig. 6, it will be seen that the depth from the bottom of the tube to the bottom of the yoke-casting is only 4 inches, whereas in the Westinghouse yoke (see Fig. 7) the dimension is 7½ inches, besides being wider in a direction parallel to the track. Quite independently of the strength to resist closing of the conduit due to its being extended under the track rails, the Westinghouse yoke is many times stronger than the London County Council yoke, and the New York and Paris yokes are also stronger than the London County Council yoke.

Experiments are to be made to see exactly what pressure is required to break the London

FIG. 4.

Section through Yoke.

County Council yokes as they now stand. We feel sure that no electric conduit in successful work could be found which would exhibit such scanty yoke dimensions, and we cannot help

*It may be mentioned that the engineers at Brussels did not attempt to make the width of the slot so small as is proposed for London, the dimension being 1½ inches. There is, further, very little traffic on those boulevards where the conduit is used. Obviously the London conditions—that is, comparatively narrow roads and exceedingly heavy traffic combined with the narrow ¾ inch slot—call for a much more solid construction.

thinking that it is taking unnecessary risk to depart so much from recent and proved practice in this respect. We understand that on no account is wood pavement to be used between the track rails, so that there will not be the difficulty from wood expanding when wet. We take it that the various authorities interested clearly understand this, and that they agree to granite sets, but we have some doubts as to whether the shopkeepers in the Westminster Bridge-road and elsewhere will like noisy sets being re-introduced.

The one thing to be said for the London County Council conduit is that as the yoke is only 26 inches wide the excavation will be less than if the yokes spanned right across the track. Seeing that the track rails have to be relaid, however, it is doubtful whether there will really be much saving, for the extended yoke need not be rectangular, as shown in Fig. 7, but can be of the more commonly employed

FIG. 5.

Sketch of Insulator in London County Council Conduit.

FIG. 6.

Section at Bottom of London Co. Council Conduit.

triangular shape as made use of in New York.

Practically all mistakes in the past have been traceable to attempted economy in first cost—either the conduit was skimpy, concrete too shallow, badly drained, or else the yoke castings too light.

Having pledged themselves to the conduit system of electric traction we do not think the London County Council is justified in considering too nicely the expense of constructing the

FIG. 7.

Section of Westinghouse Conduit.

conduit. They must face the drawback of expense properly as becomes the representative body of the leading city of the world.

One More System of Wireless Telegraphy.

THE latest proposition has been broached by the Department of Agriculture. Secretary Wilson, hearing that the Navy was casting about for a serviceable system of telegraphy, has written Admiral Bradford, Chief of the Equipment Bureau, to notify him that the Agriculture Department has been experimenting for some time with wireless telegraphy, and has attained remarkable results. His experts assert positively that they have evolved a system radically different from Marconi's, and of far greater efficiency. For obvious reasons the details of the process are kept secret, but it is probable that within a short time a practical exhibition will be made on board of a naval vessel. The outcome will be watched

with the greatest interest by all naval men, particularly in view of the announcement that not only Great Britain, but Germany and the other European maritime powers already have ordered the installation of wireless plants in their navies.

PARIS LETTER.

Special Correspondence of *ELECTRICITY*.

A Combined Voltmeter and Ampere Meter With an Adjustable Field.

M. Pellat has lately presented to the French Society of Physics, in the name of M. Menges, a galvanometer of the Deprez D'Arsonval type, which may be used as an ampere meter, or as a voltmeter in which the magnetic field is capable of regulation. To accomplish this result the movable parts turn about a horizontal axis; both of the two soft iron armatures are joined together by blocks of copper, which also oscillate to a slight extent in a horizontal arc, the axis is far from passing through the center of gravity for it is placed in such a way that both the armatures lean slightly to one side under the influence of the weight of the magnet which is placed horizontally above, but not having sufficient force to raise it; above the pole pieces the magnet is placed in magnetic derivation and formed of a piece of soft iron which by a screw may cause it to approach or move to a more or less extent from the poles.

It may be understood that in regulating the position of the piece of soft iron that it becomes possible to arrange the iron armatures to just that critical position where their weights are counterbalanced by the attraction of the magnet. In this position whatever may be its magnetic intensity, the magnetic induction which crosses the armature is always the same, for the lifting force depends solely on the induction. The magnetic induction is then always of the same intensity in the inter iron space of the field.

Wireless Telegraphy in Connection With the Human Body and Metals as Screens.

M. Guarini and F. Poncelet have just made a series of experiments on this subject, which they have presented to the Parisian Academy of Sciences; they employed a Wimschurst electro-static machine provided with the usual condensers for the production of electricity of high potential.

At some distance from the transmitter they placed an ordinary Marconi receiver.

The electric undulations, generated by sparks produced between the ball terminals of the Wimschurst machine, radiated in all directions. Considering their effects on the coherer these waves could be classified under three divisions: the first act directly upon the coherer, the second effect the coherer only by reflection, while the third does not effect it at all.

As a result of these experiments it was found that only the direct waves effected the coherer, for it remained inactive when they intercepted them by interposing a screen between it and the Wimschurst machine.

The human body perfectly fulfilled the functions of a screen; the bell of the receiver remained silent each time such an interposition was made.

A sheet of tin of small area did not prevent the radiations, but from the time the face of

the plate, which was turned towards the transmitter, was connected to earth, the coherer ceased to operate, for in this instance the radiation traveled through the soil. The conclusions were that, isolated, the tin plate became a new radiator operating by induction from one pole to the other. The Hertzian waves are therefore susceptible of being governed by inductive action, which may be prevented by interposing a metallic screen and conducting it to earth. The result of these experiments are of great importance in preventing the reverberations of signals from one relay to the other, as employed in the Guarini system, and also to prevent the action of transmitters on the coherer at the same station.

Terrestrial Magnetism and Sun Spots.

At the last meeting of the Parisian Academy of Sciences, held the 4th of February, M. Mascart, Director of the Central Bureau of Meteorology, presented a communication from M. Angot, summing up a work undertaken by him with the purpose in view of determining the influence of sun spots on the earth's magnetism, taken from observations made during a period of several years at the Parc St. Maur, near Paris, and at Greenwich, England, and he found that the mean variations comprised two terms, one being independent of, and the other proportional to the number of sun spots, that is to say in conformity with the sun's activity.

Coal in France.

Coal from the North and from the Calais section maintains a firm price. All the coal producers who are in the market keep the rates high. Manufacturers who have bargained for their coal supply will regret doing so for the price will be much lower. In the North the prices actually vary from 21 and even 19 francs to 30 francs per ton according to the quality.

The central coal mining districts have shown indications of making the price still higher, but protestations are unanimous and the Lyons Chamber of Commerce has just asked the Minister of Public Works to be kind enough to again study the tariff question of the Paris-Lyons Mediterranean Railroad, in order to provide for the transportation of American coal from the port of Marseilles.

ELECTRIC LIGHTING FOR RAILWAY CARS IN GERMANY.

The deplorable railway accident at Offenbach-on-Main, writes Consul General Frank H. Mason in a report to the State Department at Washington, has led to a sharp and thorough inquiry into the danger which may attach to the illumination of railway passenger cars by means of gas and the greater comparative safety of electric lighting. The accident referred to was a collision between the rear car of a vestibule express train backing to repass a block signal which had been overrun in a thick fog and the engine of a local passenger train which was following the express. The engine crushed its way through nearly half the length of the car, killing many of the passengers in the five rear compartments, of which the car comprised ten, all opening into an aisle or passageway along the side of the carriage.

In this crush, the chimney of the engine was cut away and the front of the boiler so broken in that the smoke and flame from the flues poured out into the wrecked car.

The passengers in the front sections of the

car escaped by the door and windows, but before aid could reach the survivors in the rear ones there was a loud explosion, which tore the wreck to splinters, set the interior on fire, and sealed the fate of those who still remained alive. This was the original and generally accepted account of the affair, although the railway officials have claimed, and the official report tacitly admits, that the explosion occurred later and when the whole interior of the wrecked car had been set on fire by the engine and was all ablaze, the point of contention being that the explosion did not of itself increase the loss of life.

However this may have been, the explosion did occur, and its nature and origin are thus explained: The car was lighted by what is known as the Pintsch system, and the supply of gas was carried in two cylinders of galvanized-iron plate about 12 feet in length which hung lengthwise beneath the floor at the middle of the car. In the collision, both these cylinders were torn loose from their fastenings and thrown into transverse positions across the track, still beneath the car. Neither cylinder exploded, but the gas from their torn connections rushed out and filled the car above, forming in a few moments a mixture of gas and air which, being ignited by fire from the engine, exploded, with the result above described.

The question of the moment is whether the Pintsch system of gas lighting for passenger cars, which has been during recent years practically universal on the State railways of Prussia, should not be replaced by electric apparatus, and this theme the technical press is now discussing with great energy and earnestness. Under this system rich coal gas, rendered still more luminous by a 25 per cent. admixture of acetylene gas, is compressed into cylindrical reservoirs and burned in specially devised lamps by burners which automatically adapt the flame to the varying pressure in the cylinders. In itself this enriched gas is not explosive, but it naturally forms an explosive mixture when combined with a certain percentage of atmospheric air. The system has been recognized as a great improvement over the stearin candles, colza oil, kerosene, and other lamps which had been previously used, and was regarded as satisfactory until electric lighting came into general use in streets and buildings. About ten years ago experiments were begun on the express trains, Frankfurt-Bebra and Stuttgart-Halle, with an electric system in which a small dynamo, placed in the baggage car and geared to an axle of the running gear, generated electric current at a voltage sufficiently above the point of utility to give a surplus, which charged a small storage battery that supplied the lamps when the train was not in motion. This worked so satisfactorily that in 1893 electric lights were adopted for the postal cars, of which there are about three thousand in use in Germany.

A postal car requires for ordinary service the illumination afforded by about fourteen full gaslights, which not only consumed rapidly the oxygen in the car, but in summer heated it to such a degree that with heat, vitiated air, and varying light supply the comfort, health, and eyesight of the employees were seriously compromised. For this reason, the electric light has become all but universal in the postal cars of Germany, each of which either carries its small dynamo and accumulator, and thus operates independently, or is

provided with storage batteries that are charged from an outside source before the car begins its journey. The storage battery used for this purpose is of a type known as the Bosc accumulator, four of which, each containing eight cells, carry sufficient energy to supply nine to eleven 12-candle incandescent lights during two nights.

Although this system, as well as the self-generating apparatus used in the two express trains above cited, has worked satisfactorily, it is recognized that the general substitution of electricity for gas in railway lighting throughout Prussia would involve not only large expenditures, but several important technical difficulties. To discard wholly the Pintsch system would mean throwing away an immense store of costly apparatus and the purchase of an entire new outfit, in which no part of the old material could be used. During the period of transition, when part of the cars in a train would be equipped with gas and part with electricity, difficulties would occur which would be serious in Germany, where so many trains do not make their entire run intact, but are cut into sections for branch lines at one point and reassembled or added to at another. In the management of postal cars, which are loaded at the point of departure and make a uniform through run without change, the loading and unloading of charged and exhausted storage batteries involves no difficulty, but this is not the case with passenger cars.

Experiments are now being made on a train between Berlin and Cologne with the Stone system of electric lighting, in which each car carries a small dynamo geared to a wheel axle and an accumulator, both hung beneath the floor of the car. This system has proved successful in England, but it is claimed here that the varying speed and stoppages of the train causes variations and unsteadiness in the light, which the accumulator does not successfully correct. Finally, the instances where gas has proved a source of actual danger in accidents have been so rare and its use has been on the whole so satisfactory that, in view of the cost and technical difficulties which a general substitution of electrical lighting would involve, expert opinion is still divided as to the wisdom or necessity of such a change.

Cost of Electric Current in Massachusetts

The Board of Gas and Electric Light Commissioners of Massachusetts have submitted to the House a communication in response to the order which was passed by that body recently. The order asked the Commissioners to state the cost of manufacturing and distributing electric light, and what, in their opinion, is a fair and reasonable price for consumers to pay for the same. In answering they say the order as passed presents peculiar difficulties in the way of a clear and specific reply. "As we understand it, it is general in character and does not apply to any particular company or locality, and requires a statement of the cost per kilowatt hour, the unit in common use. There is necessarily a considerable variation in the different companies under different conditions, in the class of both manufacture and distribution, and there is no standard of cost in either of these departments which is applicable to companies generally.

"The cost of generating varies materially, according to whether water power or steam power is used. If the latter, the pipe or steam plant in use, the cost of fuel and ample

water supply, the relation of the ordinary to the maximum demand and the conservative steadiness of the daily station load, are important factors affecting the generating cost. Using the term distribution in its strictest sense, the variable factor of most importance affecting the cost is probably the relation of the volume of business to the area in which the electricity is supplied. If the term distribution be used in the wider sense to include all the cost outside of the station, such as management and taxes, the volume of business and the value of the plant and the relation of these two to each other are important in determining the cost per unit. When the fair and reasonable price to the consumer is to be determined, not only these variables to the cost of production and distribution are to be considered, but the necessary charges for such depreciation as may not be provided otherwise together with interest or dividends upon the investment.

"The last named is frequently of more importance than any of the others and may vary more than the others according to the relation of the volume of business to the investment. From data in the annual returns it appears that the cost at the station or cost of manufacturing varied during the year, ended June 30, 1900, in different companies from less than 2 or more than 7 cents per kilowatt hour; the cost of distribution, including management, from 1 to nearly 6 cents, while the dividend cost varied more widely.

"These facts indicate the difficulty of applying to companies generally any definite statement of costs and the necessity for a careful analysis of local conditions before attempting to determine the fair and reasonable cost per unit of these items in any particular company. These suggestions, we trust, explain our inability to reply to the inquiry as specifically as we would wish and as may have been expected when the order was passed."—The "American Gas Light Journal."

ELECTROLYSIS OF WATER MAINS IN READING, PA.

Mr. A. A. Knudson, E. E., was recently called upon to examine the water mains of Reading, Pa., with a view to determining what effect, if any, the stray electric currents from the street railway systems were having upon them. The result of Mr. Knudson's investigation is embodied in an interesting report in pamphlet form. After stating at what points of the city the current in the pipes is positive to the rails, Mr. Knudson concludes as follows:

It has been intimated to me by officers of both railway companies in Reading that any changes suggested in their systems for the better protection of the water mains would be carried out. As one expressed it, "such changes would revert to their advantage in the saving of fuel."

In making the following recommendations, therefore, more freedom is felt in specifying methods than would otherwise be the case, and those made are considered only as absolutely necessary to protect the water piping system of the city from further damage.

We will first consider the points of danger on the lines of the United Traction Company.

It is respectfully recommended that where old and practically unbonded rails exist, as has been shown, and are the admitted cause of

current escape to the water mains, that such tracks be relayed with new rails as soon as such work can be arranged for.

If the U. T. Co. are not immediately prepared to relay such tracks, then the present rails should be newly bonded without delay. This applies to the Mountain road; Mineral Spring road and at the car barns; Schuylkill avenue, Perkiomen avenue and on Center avenue.

It would also be in the line of more permanent protection if on the long lines, such as Mineral Springs, Perkiomen avenue, Schuylkill avenue and the Mountain road, overhead return track feeders be placed with tap connections to the rails at intervals of from 300 to 500 feet. Few track feeders have been noticed on the lines in Reading. Few are needed on the U. T. Co.'s lines in the busiest section of the city, owing to the many intersecting tracks well jointed and well bonded, as the tests indicate, in a large measure taking the place of feeders. This unusually favorable condition has already been referred to; on some of the longer lines, however, the case is different, and such lines should receive as much care and attention in this respect, if the water mains are to be protected, as lines in the central portion of the city.

The track crossing at Fourth and Franklin streets show differences of potential at every joint, ranging from .2 of a volt to .6. This crossing shows evidence of wear and the entire crossing should be renewed, as such conditions cause a diversion of the current from the rails to the water mains; also the crossing at Sixth and Franklin streets, both of these crossings should receive early attention.

Several tests in the city on the U. T. Co.'s lines have been made at other street crossings, and at switches on the turnouts, and at railroad crossings, but with the above exception those that have been examined are found to be in good order.

READING & SOUTHWESTERN RAILWAY.

The light rails on Franklin street with inefficient bond result in a poor return to their power station for the railway current, and causes much of it to be diverted to the water mains under the street.

I am not aware what the intentions of this company are as to relaying these rails with new and heavier ones in the near future, but if they are to remain for any length of time, it is recommended they should be rebonded without delay. Further than this an auxiliary track return wire should be placed on the poles, running from the negative of the power station to and through Franklin street to Ninth and connecting both rails of the track at that point and at intervals along the line of not less than 400 feet. There should also be cross bonds between the two rails at about midway between the tap connections; the most important point on this line, and one that should receive first attention, is the Chestnut and Canal street railroad crossing. As the conditions at this crossing are peculiar and such as to require special attention, I have under the head of Supplementary, which is attached to this report, recommended a method which is specified and which I believe, if well carried out, will greatly lessen the escape of current to your water main and materially reduce the rate of damage to same in this vicinity, as well as preventing liability to accident.

In reference to these recommendations as a

whole, covering defects discovered on the lines of both companies operating in Reading, it should be said that they can only be regarded as a temporary and partial remedy for electrolysis. Large escapes of current and immediate damage to mains can be modified, but a single overhead trolley system, with grounded returns, is always more or less a menace to water mains.

There is one certain cure for electrolysis, however, and although well known it may be mentioned here. I refer to the double trolley, overhead or underground. The overhead being the least expensive to construct of the two, is more desirable, except for large cities. The overhead method has been in successful operation in Cincinnati for about ten years, and also in a somewhat improved construction in the District of Columbia for about two years under acts of Congress. The difference in appearance between the two is scarcely noticeable. There being no electrical connection with the rails; the return currents are kept out of the ground and consequently there is no escape to the water mains.

No bonds are needed at the rail joints, nor auxiliary track returns (heavy insulated wires) on the poles.

The saving in fuel which such change would effect, particularly on the lines of the R. & S. W. road, would, I feel sure, in a comparatively short time, equal the cost of making such change.

It should always be borne in mind that so long as the single trolley system, using the rails and ground for a return, is in use, there can be no complete relief from electrolytic damage. The recommendations made in this report, if carried out, will only be palliatives; and the city, in seeing that they are carried out by the railway companies, should so protect itself that hereafter it cannot be claimed by the railway companies that they, having complied with the city's requirements, are not responsible for subsequent injury.

It behooves the city to proceed carefully in this matter, in order that it may not by appearing to accept as sufficient the partial remedies herein recommended, relieve the electric railway companies from responsibility for the injuries which must ultimately result if the single trolley system is continued.

Safety to life, as well as safety to water mains, however, demand that the railway crossings at Chestnut and Canal streets, herein mentioned, receive immediate attention.

Respectively submitted,
(Signed) A. A. KNUDSON.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Grand Trunk Railway has under consideration a plan to run electric cars of its own over the Victoria Bridge, across the St. Lawrence at Montreal. The cars will connect with other electric lines on both sides of the river.

It is reported that arrangements are nearly completed for securing electric power for the city of Toronto, Ont., from Niagara Falls by the end of the coming summer at a great reduction of the present cost of power. Preliminaries for the production and delivery in Toronto have been worked out. It is said that the specifications, as prepared, show that the power can be delivered in the city at a sum amounting to about \$600,000.

LEGAL NOTES.

Last week the Bullock Electric Manufacturing Company filed in the U. S. Circuit Court of Cincinnati, O., a demurrer to the Westinghouse Electrical Manufacturing Company's bill of complaint on an alleged infringement on three patents.

The Electric Storage Battery Company, March 5, brought suit in the United States Circuit Court, through its counsel, John R. Bennett, against the Gould Storage Battery Company, doing business in New York City and with its works located at Depew, N. Y., for the alleged infringement of the H. Ward Leonard patent for the improvement in systems of electrical distribution, praying for an injunction and claiming \$50,000 in damages.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended March 6:

Antwerp, 11 packages, \$1,571; Argentine Republic, 111 packages, \$6,031; Australia, 78 packages, \$16,995; Brazil, 971 packages, \$39,404; Bristol, 1 package, \$100; British East Indies, 1 case, \$100; British Possessions in Africa, 200 packages, \$19,482; 19 crates auto vehicles, \$4,288; British West Indies, 64 cases, \$500; Brussels, 12 packages, \$163; 8 cases, \$900; Central America, 337 packages, \$2,951; Chili, 25 packages, \$1,371; Copenhagen, 1 case motor vehicles, \$1,500; Cuba, 59 cases, \$6,480; Dundee, 3 crates trolley wagons, \$350; Dutch West Indies, 13 packages, \$462; Ecuador, 73 cases, \$774; French West Indies, 1 box, \$15; French Possessions in Africa, 1 case, \$38; Genoa, 1 case, \$64; Glasgow, 97 packages, \$1,021; 3 cases motors, \$182; 7 cases \$1,500; 128 reels electric cable, \$44,901; Hamburg, 7 packages locomobiles, \$4,200; 108 packages, \$8,058; Havre, 105 packages, \$6,405; Hayti, 2 packages, \$38; Liverpool, 313 packages, \$20,550; 3 packages motor vehicle parts, \$275; 4 packages auto registers, \$150; London, 192 packages, \$12,564; 34 packages motor vehicles, \$14,700; Manchester, 4 packages, \$895; 4 crates trolley wagons, \$5,750; Marseilles, 1 case, \$40; Mexico, 90 packages, \$1,017; 11 cases, \$110; Milan, 3 cases, \$220; Naples, 1 case, \$2,391; New Castle, 10 packages, \$1,000; New Zealand, 1 package, \$700; Peru, 31 cases, \$2,391; Rotterdam, 1 package, \$75; Sheffield, 2 cases, \$138; Siam, 41 packages, \$1,641; Southampton, 13 cases, \$489; Stockholm, 2 cases, \$61; U. S. Colombia, 2 packages, \$20; 1 case, \$562; Venezuela, 181 packages, \$1,331.

PERSONAL MENTION.

Gen. Nelson A. Miles was recently chosen president of the National Capitol Automobile Club of Washington, D. C.

Mr. Thomas E. Mitten of Milwaukee, Wis., has accepted a position in the operating department of the International Traction Company in Buffalo, N. Y., and will assist in executing a system for the rapid transportation of crowds during the Pan-American Exposition.

Mr. Thomas H. McLean, manager of the Toledo (O.) Traction Company, died of pneumonia a short time ago.

Capt. George E. Stone, head of the local telephone system in Cincinnati, O., died March 8 from pneumonia, following an operation for appendicitis.

INCORPORATIONS.

The Iola Electric Railway Company, Iola, Kan. Capital stock, \$50,000.

The Radiant Incandescent Light Company, Rochester N. Y. Capital stock, \$10,000. Directors: I. W. Paul, E. F. Craggs and J. A. Begy, all of Rochester.

The Bucyrus Gas & Electric Light Company, Bucyrus, O. Capital stock, \$150,000. Incorporators: Wilson C. Lemert, James B. Gormley, John W. Gwynne, Isaac C. Baxter and F. P. Kaler.

The New Jersey and Pennsylvania Power & Electric Company, Newark, N. J.—to furnish electricity for light, heat, etc. Capital stock, \$100,000. Incorporators: Howard Mutchler, Charles L. Hemingway, both of Easton, Pa.; Robert A. Montgomery of Lambertville, N. J., and Irvin W. Schultz of Phillipsburg, Pa.

The Standard Electric Company, Danville, Va.—to operate electrical engineers and contractors and to buy and sell supplies. Capital stock, \$5,000. Officers: James G. Penn, president; R. L. Dibrell, vice-president; James M. Williams, secretary and treasurer, and W. Drummond Marrow, manager.

The Lancaster County Railway & Light Company, Trenton, N. J.—to construct and operate electric light, gas and power plants, and railways outside of New Jersey. Capital stock, \$2,000,000. Incorporators: Samuel R. Shipley, William W. Griest, William B. Given, Philip B. Shaw and Lindley M. Garrison.

The Lyons & Sodus Bay Railway Company, Lyons, N. Y.—to build an electric road from Lyons to Sodus Point. Capital stock, \$400,000. Directors: Daniel B. Platt, Ira M. Ludington, Charles Van Voorhis, Stephen G. Hollister, Rochester; Sanger W. Case, Sodus; James D. Bashford, Calvin Hotchkiss, Charles P. Williams and Daniel Parton, Lyons.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 5, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

669,218. Electric Railway. Hugo Hirst, London, Eng. Filed Jan. 29, 1901.

669,459. Electric Railway. Charles E. Fournier, New London, Conn. Filed June 7, 1900.

669,477. Electric Time-Switch. Henry J. Cogswell, Hartford, Conn. Filed July 20, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

669,151. Electric Lamp Socket. John H. Trumbull and Henry Trumbull, Plainville, Conn. Filed Dec. 16, 1899.

669,306. Incandescent Lamp. John W. Howell, Newark, N. J., assignor to the General Electric Company of New York. Filed Nov. 25, 1896.

669,357. Construction of Carriers for Globes or Glasses of Electric Gas or Oil Lamps. Eadley Stanley, London, Eng. Filed Oct. 22, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

669,102. Combined Switch and Rheostat. Henry E. Reeve, Brooklyn, N. Y. Filed July 2, 1900.

669,238. Electric Igniter for Explosive Engines. William F. Davis, Milwaukee, Wis. Filed Jan. 2, 1900.

669,299. Dynamo-Electric Machine. Norman C. Bassett, Lynn, Mass., assignor to the General Electric Company of New York. Filed Dec. 12, 1899.

669,438. Magnetic Blow-Out Brush-Holder. Arthur C. Eastwood, Cleveland, O., assignor to the Electric Controller & Supply Company, same place. Filed Dec. 3, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

669,072. Telephone Apparatus. Peter C. Burns, Chicago, Ill. Filed July 31, 1899.

669,094. Telephone Apparatus. William O. Meissner, Chicago, Ill., assignor to the American Electric Telephone Company, same place. Filed May 2, 1898.

669,114. Support for Telephone Receiver. John J. Hartl, Chicago, Ill. Filed Oct. 26, 1900.

669,366. Telephone System. Clarence Malthaner, Minneapolis, Minn. Filed March 16, 1900.

669,471. Telephone Key. Ernest E. Yaxley and Charles C. Cadden, Chicago, Ill., assignors to the Victor Telephone Mfg. Company, same place. Filed Sept. 22, 1899. Renewed Jan. 5, 1901.

MISCELLANEOUS.

669,085. Battery Electrode. Gustavos Heidel, St. Louis, Mo. Filed March 21, 1900.

669,100. Physician's Electric Lamp. Purdy M. Randall, New York City, assignor, by mesne assignments, to the Unique Electrical Device Company, same place. Filed May 16, 1900.

669,130. Manufacture of Electrical Heating Appliances. Adolf Vogt, Westminster, Eng., assignor to the Electrical Resistance & Heating Company, Ltd., London, Eng. Filed May 23, 1900.

669,149. Capillary Electrometer for Relay Purposes. Albert

C. Crehore, Tarrytown, N. Y., and George O. Squier, Washington, D. C., assignor to the Crehore-Squier Intelligence Transmission Company, Cleveland, O. Filed Oct. 20, 1899.

669,155. Lightning Arrester. Herbert C. Wirt, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed April 30, 1897.

669,240. Electrode Plate for Electric Accumulator. Heinrich F. Hobel, Berlin, Germany, assignor to Akkumulatoren und Elektricitätswerke Aktiengesellschaft vorm. W. A. Boese & Co., Berlin, S. O., Germany. Filed Oct. 20, 1900.

669,291. Current-Interrupter. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Dec. 26, 1899.

669,310. Electric Metering System. Eustace Oxley, Lynn, Mass., assignor to the General Electric Company of New York. Filed Oct. 12, 1899.

669,336. Method of Local Applications of Electric Treatment to the Human Body. Herman Behrendt, Worms, Germany, assignor to Wilhelm Schmidt, same place. Filed Sept. 18, 1900.

669,338. Electric Clock. Sigismund Fischer, New York City, Filed Jan. 8, 1900.

669,358. Insulated Electric Conductor and Method of Making Same. Charles P. Steinmetz, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed July 30, 1900.

669,429. Coin-Controlled Electric-Circuit Closer. William H. Paine, Providence, R. I., assignor to the Automatic Tire Inflator Company, same place. Filed March 14, 1900.

669,439. Electrolytic Apparatus for Recovering Metals. Hans A. Frasch, Hamilton, Can. Filed July 30, 1900.

669,440. Method of Recovering Metals by Electrolysis. Hans A. Frasch, Hamilton, Can. Filed July 30, 1900.

669,441. Method of Producing Alkali by Electrolysis. Hans A. Frasch, Hamilton, Can. Filed Aug. 16, 1900.

669,442. Process of Recovering and Separating Metals by Electrolysis. Hans A. Frasch, Hamilton, Can. Filed Sept. 15, 1900.

669,486. Secondary Battery. Henry C. Porter, Chicago, Ill., assignor to Owen H. Fay, same place. Filed Dec. 27, 1899.

669,487. Battery Plate or Grid. Henry C. Porter, Chicago, Ill., assignor of one-half to the Owen H. Fay Livery Company, same place. Filed Feb. 5, 1900.

REISSUE.

11,893. Process of Operating Two Liquid Primary Batteries and Regenerating Element Thereof. Henry K. Hess, Albert J. Shinn and Carl Hering, Philadelphia, Pa., assignors to Herman J. Dercum, trustee, same place. Filed Jan. 24, 1901. Original No. 649,841, dated May 15, 1900.

DESIGNS.

34,173. Contact-Base for Incandescent Lamp. Irving E. Brown, Providence, R. I., assignor to the Providence Gas Burner Company, same place. Filed Feb. 7, 1901. Term of patent 14 years.

34,174. Contact-Ring for Incandescent Lamp Bases or Caps. Frederic H. Manchester, Providence, R. I., assignor to the Providence Gas Burner Company, same place. Filed Feb. 7, 1901. Term of patent 14 years.

COMMERCIAL PARAGRAPHS.

J. J. Reidy of New Haven, Conn., who handles the Donnelly Improved Steel Climber, which has been adopted by the leading telegraph and telephone companies in the country, writes that he is having an unusually large trade this year and that the Manhattan Electrical Supply Company of New York City alone has sold over 300 pairs of these climbers during the past two months.

The Sprague Electric Company reports an increase of sales over the corresponding month last year, and that the outlook for this year is exceedingly bright. Among recent orders are one 75 hp. and four 80 hp. motors for the Cooke Locomotive and Machine Co., Paterson, N. J.; 35 motors for the Central Lard Co., New York, who placed the order through their electrical engineers, Messrs. Floy & Carpenter; one 400 kw. generator, one 125 kw. generator, one 100 hp. motor and six 80 hp. motors, in addition to a number of small motors for the Wellston Portland Cement Co.; an order placed by Mr. George Hill, 150 Fifth avenue, New York, for the Dunmore Iron & Steel Company, Dunmore, Pa., consisting of one 62½ kw. generator, one 100 kw. generator and 25 motors of assorted sizes; one 75 kw. generator, one 25 hp. and one 30 hp. motor for the National Distilling Company, Milwaukee; one 125 kw. generator for the Big Muddy Coal & Iron Company, Murphysboro, Ill.; one 100 kw. generator for the Keystone Leather Company, Camden, N. J.; seventeen motors for the Norfolk Navy Yard; one 50 kw. and one 75 kw. engine type generators for the new Windsor Arcade Building, New York; two 75 kw. engine type generators for the new City Prison, Blackwell's Island; two 100 kw engine type generators for the Manhattan State Hospital, Central Islip, and two 300 kw. 500 volt street railway generators for the Central States Construction Company, Chicago.

THE TELEPHONE WORLD.

Taxing Telephone Companies

In Louisiana the plan followed by the State Assessor in telephone taxation appears to have been to tax the Bell interests \$100 per mile for lines having copper wire and \$50 per mile for lines with common wire, and to let the taxation of the independent lines range from \$8.33 to \$90 per mile, all this in addition to the taxation of plants, etc. In Arkansas telephone companies are assessed by the county assessors in the respective counties in which their lines are built, and there is no State tax. This is the custom in Florida, though in the latter State telegraph lines are assessed by the State, and the last assessment on nine telegraph companies shows an aggregate value of \$259,317.40. The aggregate value of all the telephone lines in Florida assessed by county assessors during the year 1900 is \$4,000.

In Georgia, prior to the meeting of the present Legislature, telephone companies were required to make returns of their property to the local tax collector in each county in the State. But under the new law telephone companies are now required to make sworn returns to the Controller General. All laws levying State taxes apply equally to resident and non-resident telephone companies, and the property of both are taxed the same as the property of individuals. No report has yet been made covering the assessment of telephone companies in Georgia. In Colorado all telephone companies are assessed by the State board of equalization, and are required by law to file annual reports with the board.

The Postal District Messenger Company, with a capital of \$10,000, filed articles of incorporation last week in the office of the county clerk of Hudson County, N. J. The articles provide that the business of the concern may be conducted in every State, territory and colony of the United States. The company is incorporated to include the business of a common carrier and construct telegraph and telephone lines. The capital stock is fixed at \$10,000, and the local agent of the company is Aaron C. Ackerman of 99 Montgomery street, Jersey City. The incorporators are W. H. Baker, Charles P. Brush and John O. Stevens, all of the Postal Telegraph & Cable Company.

An automatic device threatens to take work away from the telephone operators, says a daily paper. A new apparatus, the invention of a Providence, R. I., electrician, is being built in Forestville, Conn., and if efficient, will enable every telephone subscriber to make his own connection. New York and Boston capitalists are behind the enterprise. Every telephone is to be fitted up with a miniature exchange, and only when longer distances are wanted will central have to be called upon. The new device is called the auto-commutator. Connection is made by setting the hands of a dial until they point to the number wanted. Then a plug is inserted, and the connection is made.

For some years there has been a small local telephone line doing business in Monrovia, Cal., but of late the Sunset line, which covers all of Southern California, has been cutting rates in a contest with the local line. The latter, known as the Juvinall system, is now being reorganized, with a view to covering a number of small towns in that section, and it is reported that considerable capital has been interested in the building of extensions of the line.

The farmers of Lake View, Ia., have organized a telephone company because of the difficulty with the Bell Company. Several of the farmers will have phones in their residences. No charge will be made to the public for the use of the exchange, which will be located at Lake View. Connection will be made with Odebolt, Sac City, Early and Wall Lake. Charles Irwin has been elected president and B. Broughton secretary.

Secretary of State Morton recently granted a charter to the Union Telephone Company of Macon County, Tenn., with \$5,000 capital stock. The incorporators are: H. C. Smith, H. N. Donoho, John B. Dalton, A. W. Wakefield, E. K. Lamb, L. L. Simmons and H. H. Carter.

The Southwestern Telegraph & Telephone Company of Hallettsville, Tex., is making extensive improvements in its system. A new and large switchboard is being put in and the wires are all being placed in lead cables.

The people in Cartersville, Mo., want to be connected with the rest of the world by long distance telephone.

The De Kalb County Telephone Company of Sycamore, Ill., has increased its capital stock from \$15,000 to \$50,000.

A. C. Moore of Tampa, Fla., desires to correspond with manufacturers of equipment for a telephone exchange.

Combination of Independent Companies.

In connection with the proposed consolidation of the independent telephone companies of the country, it is asserted that York, Pa., is to be the headquarters of the concern and that several capitalists of that city will be among the officials.

It is proposed to erect there an Eastern plant of the American Electric Company of Chicago for the manufacture of telephone supplies. Inasmuch as the Chicago plant cannot supply the demand and because York is practically the center of the Eastern group of independent companies and one of the largest of them, it is believed the plant will be secured for York.

It will be a big concern and employ probably 1,500 hands. Already ground has been offered for the purpose free of cost. Consolidation is expected to take place in a very short time.

The Hudson River Telephone Company, which operates in Albany and the cities and villages of the Hudson River and Mohawk valleys and of Northeastern and Southern New York and Southern Pennsylvania, on March 7, filed with the Secretary of State a certificate of increase of capital stock from \$3,000,000 to \$4,000,000. The additional capital will be employed in extensions and improvements. The amount of capital stock of the company actually paid in is \$2,854,200, and the amount of its debts and liabilities is \$200,000. At the annual meeting of the company, Walter C. Humstone of New York, superintendent of the Western Union Telegraph Company for the Eastern district, was elected a director of the company to fill a vacancy.

A telephone system, with common barbed wire fences as the means of conducting the voice of the patrons, was placed in use at Pullman, Wash., a short time ago, and is said to work nicely, conversation being held easily over any long-distance telephone line. This entire line, nine miles in length, with four telephones, costs less than \$100. The telephones cost \$12 each in Chicago. The chief expense of building the line was encountered in town, and for two miles out, there being no wire fences that distance. The poles of the electric light company were used for stringing the wire in town.

Articles of incorporation have been drawn up and filed for a local telephone exchange at Callaway, Neb., with John Moran, H. H. Andrews, W. E. Shupp, A. L. Mathews and J. D. Weiland as the incorporators. Mr. Andrews, chief promoter of the enterprise, has already received applications for forty-five telephones and there will be more as soon as the exchange is installed. The extension of the line for 12 or 15 miles into the country in different directions is also contemplated with stations at convenient intervals, placing the farmers in close touch with the market reports, and will be a benefit to them in many ways.

What is apparently the opening of a long contest between the Southern New England Telephone Company and New Britain, Conn., occurred recently. The city has a telephone instrument in the old city building and asked the telephone company to remove it to the new city building. The company declined to do so on the ground that it would have to put its wires into the subway. To this the company is opposed. The telephone company has kept very quiet throughout the subway agitation, but is understood to be opposed to taking the step, which the city will insist shall be done.

An effort is being made by some of the business men in Delhi, N. Y., to establish a free telephone service between Delhi and the station, a distance of two miles. The instruments, material and other work are estimated not to cost more than \$50.

Amended articles were lately filed by the Tri-City Telephone Company of Clinton, Ia. The capital is increased from \$35,000 to \$90,000.

Arrangements are nearly completed to put in a telephone exchange at Cass Lake, Minn., which will be connected with the long distance system.

The Iowa Telephone Company has lately placed an order for \$50,000 worth of copper wire for use in repairing its long distance lines throughout the State.

Last week the Northwestern Ohio Telephone Company increased its capital stock from \$30,000 to \$40,000. P. J. Lenhart is the president and F. J. Spencer, secretary.

The Ravenna Home Telephone Company of Ravenna, O., has increased its capital stock from \$10,000 to \$20,000.

R. B. Middlebrook, city counselor, in Kansas City, Mo., has finished his examination of the various telephone laws of the country and is now prepared to bring proceedings to enforce the new Kansas City law which allows the telephone company to charge only \$48 and \$30 for its service. Mr. Middlebrook declined to make known just what policy he would pursue in bringing action against the telephone company, but he said that he was ready to begin at any time. It is not known whether the proceedings will be in the nature of a mandamus or a common arrest through the channels of the police court. The question of cheap telephone rates will undoubtedly go to the Supreme Court before the litigation is over. The telephone company holds that the law cannot be enforced and will consequently contest it.

At a recent meeting all arrangements were completed for placing the independent telephone companies of Western Maryland, Pennsylvania, Virginia and West Virginia under a single management. Later the plans will be extended to include all the Western States, and the committee expresses the belief that the result will eventually be a telephone service able to compete with the Bell system. The capitalization will be at least \$2,000,000. There will be a long distance service to New York, Philadelphia and Baltimore.

News from Deadwood, S. D., states that the Harrison Telephone Company will extend its line to the Southern Hills towns this spring. At present it reaches all of the towns in the Northern Hills, and as far south as Rapid City. It will be extended to Keystone, Hill City, Custer and Hot Springs, which will give it the same circuit that the Black Hills Telephone Company has. The latter company has put in a station at Oreville. The Black Hills, it is claimed, has the most complete telephone service in the West.

The People's Independent Telephone Company, which has plants in Niagara Falls, Tonawanda, Medina, Albion, N. Y., and other places, has applied to the village trustees for a franchise in Warsaw of this State. It names \$16 as the top price for residences and \$30 for business places, all service to be on single metallic circuits.

A new telephone line is being built from Farber to Hutchinson, Mo., a distance of 11 miles. The company was organized by electing R. E. Sisk, president; W. J. Crow, vice-president; C. A. Davault, secretary, and William Lake, treasurer, and is known as the Farber Telephone Company.

The Home Telephone Company of Cortland, N. Y., has ordered two new sections for its switchboard to make room for 200 more phones. The plant was originally intended for 400, but the large number of subscribers has already made an increase in the plant necessary.

At a recent meeting of prominent citizens of Alnsworth, Neb., it was decided to organize a telephone company to construct a line from Alnsworth to Springfield and Norden. Over \$1,500 was subscribed and the work will begin at once.

E. W. Coleman has completed the payment of \$10,000 for a telephone franchise in Louisville, Ky., and the general council will authorize the construction of an independent system.

The Astoria, Ore., council has passed an ordinance to place a license of 10 cents per month on each telephone operated in that city.

Oliver Springs, Tenn., has a telephone exchange completed and in operation.

TELEPHONE INCORPORATIONS.

The Union Mutual Telephone Company, Union, Ia. Capital stock, \$2,000.

The Houston Telephone Company, Golden, Ill. Capital stock, \$2,500. Incorporators: T. J. Downing, E. J. Hedrick and others.

The Southwestern Telephone Company, Beaumont, Tex. Capital stock, \$50,000. Incorporators: Lawrence Harrison, T. C. King and S. E. Chapan.

The Preston Bend Telephone Company, Preston, Tex. Capital stock, \$5,000. Incorporators: A. G. Noble, Hamp Willis, R. A. Owen and J. T. Watkins.

The Farmers & Merchants' Union Telephone Company, Griggsville, Ill. Capital stock, \$2,500. Incorporators: Angus N. Orr, Adam Zimmerman and J. W. Orr.

The Gladbrook Telephone Company, Gladbrook, Ia. Capital stock, \$10,000. Incorporators: Samuel B. Montgomery, J. A. Davis, Aldine R. Kroh and Fred W. Browne.

GENERAL ELECTRICAL NEWS.

Lighting.

Algood, Tenn.—This place is making an effort to secure an electric light plant.

Bolivar, Mo.—The citizens have decided to erect an electric light plant.

Brigham, Utah.—Articles of incorporation of the Brigham Light & Power Company were lately filed. The object is to establish and operate an electric light and power plant here. The capital stock is placed at \$20,000. H. M. Ogle is president and treasurer of the company.

Brownsville, Tenn.—The Brownsville Electric Light Company will rebuild its power house lately destroyed by fire. J. Clinton, secretary.

Canton, O.—The Canton Light, Heat & Power Company of Canton has increased its capital stock from \$150,000 to \$225,000. Extensive improvements are to be made to the plant so as to increase its capacity and efficiency.

Cartersville, Ga.—The Eyowah Milling Company of this place contemplates the erection of an electric light plant.

Clayton, Ala.—This city will issue bonds for an electric light plant.

Clear Lake, S. D.—This town is preparing to erect an electric light plant.

Concord, N. H.—A movement has been started to erect an electric light plant here.

Cove, Ore.—The citizens of this place are discussing the question of erecting an electric light plant.

Culpeper, Va.—This city will erect an electric light plant. Address the mayor.

Edinborough, Pa.—At the next meeting of the council Hon. F. L. Hoskins and Hon. P. A. Gibson will ask for a franchise to erect an electric light plant here.

Emporia, Va.—W. F. Deal has been granted a franchise to erect an electric light plant here.

Fairfax Va.—R. C. L. Moncure and others have chartered a \$5,000 company to establish an electric lighting plant.

Hagerstown, Ind.—S. Shafer, representing Muncie capitalists, is here to establish a new electric light plant, providing a sufficient number of subscribers can be secured.

Hearne, Tex.—The Planters' Oil Company is in the market for a 125-light dynamo.

Holly, Mich.—The electric light company has announced a reduction of 33 $\frac{1}{3}$ per cent. in the price of electricity.

Huntington, Ark.—The Huntington Electric Light & Power Company, with a capital of \$8,000, has been chartered here by M. Hayes, H. F. Rogers and others.

Kokomo, Ind.—Twenty of the leading business men of this place have organized an independent electric light company and will at once begin the erection of a new plant here.

Mansfield, O.—The question of the issue of \$65,000 bonds to provide funds for the establishment of a municipal electric lighting plant in connection with the sanitary plant now in process of construction here will be voted on at the coming election.

Marion, Ala.—Messrs. Lide, Wilbourne & Hurt is the company that received a franchise to put in an electric light plant here. Address J. Hurt.

Plainfield, Ill.—The citizens are agitating the question of erecting an electric light plant.

Oxnard, Cal.—This place is to have an electric light and power plant.

Paragould, Ark.—This city wants proposals for the erection of an electric light plant. J. A. Morgan is chairman of the committee that has the matter in hand.

Roanoke, Ala.—This city will issue bonds for the erection of an electric light plant.

Sabetha, Kan.—The citizens contemplate the erection of a new \$10,000 electric light plant.

Sandersville, Ga.—Holt & Bro. of this place want estimates on an electric light plant.

Stillwater, Okla.—An electric light plant will soon be built here.

Suffolk, Va.—N. M. McAnge, chairman of the com-

mittee of Suffolk, will open bids March 15 for the municipal lighting of the streets and buildings.

Trenton, Mich.—The question of erecting an electric light plant here is being discussed.

Wapella, Ill.—The question of erecting an electric light plant is being agitated by the citizens of this place.

West Nashville, Tenn.—The West Nashville Light & Power Company, with a capital of \$15,000, has been chartered by M. G. Cockrill, L. H. Davis and others to build a light and power plant.

Street Railways.

Annadale, N. Y.—The Richmond Beach Railway Company was lately incorporated with a capital stock of \$30,000, to operate a steam or electric line from Arbutus Lake to tracks of the Staten Island Rapid Transit Railroad near this station.

Ashmore, Ill.—The project of constructing an electric railway from Oakland to this place via Spring Lake and Newman is being promoted by Coles County capitalists headed by State Senator S. C. Pemberton, Judge Winkler and others.

Auburn, Me.—An electric road is projected between here and Canton, a distance of 22 miles. It would pass through Turner, North Turner and Britton's Mills.

Belleville, Mich.—This village has granted a franchise for an electric railroad through this township to George H. Waldo of Detroit.

Buffalo, N. Y.—The machine shop of the International Traction Company was completely destroyed by fire last week. The loss is about \$50,000, including \$40,000 worth of valuable electric machinery which was in the structure.

Dowagiac, Mich.—The city council has granted a 30-year franchise to the Lake Michigan & Eastern Railway to build and operate electric lines in and through this city, the same to be in operation within two years.

Dundee, N. Y.—The project of an electric road from here to Bradford by way of Crystal Springs, Keuka, Wayne, Weston and Tyrone is being agitated.

Flushing, N. Y.—It is authoritatively stated that the Jackson avenue trolley line of the New York & Queens County Railroad is to be built during the coming spring.

Lawrence, Kan.—This city has granted a franchise to L. M. Erb of New York for an electric street railway.

Marysville, O.—The Richwood, Marysville & Columbus Electric Railroad Company was lately incorporated for \$10,000 by F. G. Fullington, W. King and R. L. Woodburn. The company will build an electric railway from Byhalia to Columbus.

Montgomery, Ala.—The proposition to build an electric railway from here to Selma is a go, says Frank Baltzell, one of the promoters in this city.

Olivet, Mich.—Application has been made to the council to grant a 30-year franchise to D. D. Ford to build an electric railway through this village. The road will connect Battle Creek with Lansing.

Painesville, O.—C. W. Goodrich and P. W. Tuttle of Geneva and L. B. Stanley of Collinwood, promoters of the Painesville-Geneva electric line, have been granted a franchise through Lake County by the county commissioners.

Warren, O.—It was learned recently that several men are at work getting the right-of-way for an electric line between here and Garrettsville, by way of Leavittsburg. The line will be the last link in a Cleveland-Pittsburg connection. It is believed that Cleveland and Youngstown men are back of the movement.

Washington, Ind.—Z. F. Graham, owner of the street railway system in this city has announced that he would build an electric line to Loogootee, 17 miles east of here. It will pass through two towns. Several Cincinnati capitalists are interested. The estimated cost of building the line is \$120,000.

Xenia, O.—The council has voted in favor of an ordinance giving the J. P. Martin traction line the right of way through this city.

Manufacturing.

Anderson, Ind.—The Anderson Tool Company of this city, has lately been incorporated with a capital stock of \$50,000. The new company will manufacture tools, lamps, electrical tools and small machinery. Charles Eastman, C. W. Hooven, J. A. Van Osdol, T. N. Stilwell, Edward S. Lea, George Lilly, J. E. Johnson and F. W. Makepeace are the directors.

Birmingham, Ala.—The Hardie-Tynes Foundry & Machine Company is in the market for a 65 kilowatt generator, one 20 horse power electric motor and two 5 horse power motors.

Cleveland, O.—A number of sanitariums will be established in various cities, where patients can be treated for consumption. This city will be the headquarters. The Brush Electric Company will manufacture the apparatus.

Company Matters.

Brooklyn, N. Y.—At the meeting of the newly-elected directors of the Edison Electric Illuminating Company of this city, held last week, the following officers were elected for the ensuing year: President, A. N. Brady; first vice-president, A. M. Young; second vice-president, William Berri; secretary, W. W. Freeman; treasurer, A. W. Dater; assistant treasurer, A. N. Nielsen.

Toronto, Ont.—The annual general meeting of the shareholders of the Holmes Electric Protection Company of Toronto, Limited, was held recently. The report presented by the directors to the shareholders was a very satisfactory one, showing marked progress for the past year.

Power and Transmission.

Duluth, Minn.—The Highland Canal & Power Company has filed its papers in condemnation proceedings for a water power canal 50 miles long, designed to deliver at the head of the hill above this city water that will generate 100,000 horse power electrical energy every 24 hours at the meters of consumers in the city and at Superior.

Salinas, Cal.—It is reported that the Slack Canyon Coal Mining Company will soon put in a power plant. This plant is designed to furnish power and light to this city and all towns south as far as Santa Barbara. It is the intention of the company to put up an immense power plant at the mines and use compressed coal dust for fuel.

Automobiles.

Chicago.—The Illinois Electric Vehicle Company, operating 100 auto cabs, has decided to go out of existence. According to one of the officials of the company, the affairs of the organization will be wound up at the next annual meeting of the stockholders on April 6. Among the directors of the company are John J. Mitchell, Robert T. Lincoln, C. K. G. Billings, P. A. B. Widener, Harry Payne Whitney and E. L. Brewster.

San Juan, Porto Rico.—Boston men with capital recently formed a company called the San Juan Transportation & Trading Company. It is the purpose of this concern to operate an automobile line from the port of Ponce to the city of Ponce, a distance of three miles, and also a city line from San Juan to Morro Castle and the various resorts. It is expected that the tourist travel to the island will be greatly increased, and that this will add to the business.

Toledo, O.—Articles of incorporation were lately filed with the secretary of state by the Toledo Automobile Company, with a capital stock of \$25,000. F. E. Southard, E. P. Hubbell, E. G. Eager and C. M. Hall are among those interested. The business will be confined solely to automobiles and repairing of machines. Steam, electric and gasoline vehicles will be carried in stock, also electric hansom, carriages and opera wagons.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½¢@16¾¢; Lake, 16¼¢@16½¢; casting, 16½¢@16¾¢.

Directors of the Commercial Cable Company have declared a quarterly dividend of 1¼ per cent., payable April 1.

The regular semi-annual dividend of \$2 per share has been declared on Philadelphia Traction stock, payable April 1 to holders of record March 9.

The annual meeting of the Centennial Copper Mining Company, will be held April 2, at 12 m. in Boston. Transfer books close March 11 and open April 3.

The General Electric Company has declared a quarterly dividend of 2 per cent. on its common stock, payable April 15 to stock of record March 30.

The Bronx Gas & Electric Company has given a mortgage to the Continental Trust Company for \$500,000 to secure an issue of 50-year 5 per cent. gold bonds for the same amount.

The Jamestown (N. Y.) Street Railway Company reports for the quarter ended December 31: Gross earnings, \$21,685; net income, \$1,282; cash on hand, \$137; profit and loss surplus, \$20,775.

The Twin City Rapid Transit Company has declared the regular quarterly dividend of 1¼ per cent. on its preferred stock, payable April 1. Books close March 26 and reopen April 2.

A franchise has been granted to the Clyde Electric Railway to construct a direct line through Clyde, N. Y. This is part of a Rochester syndicate's plan for an electric road to connect all villages between Rochester and Syracuse and to light all the towns.

It is reported that the New York, New Haven & Hartford Railroad Company will make an effort to purchase the trolley lines operated by the Old Colony Street Railway Company, and that it is preparing to complete its service of electric cars from Newport to Providence and Boston.

The Metropolitan Elevated Railroad Company of Chicago has issued a circular to stockholders announcing the desire of the management to issue \$1,400,000 additional bonds for the purpose of completing the extensions to the road recently outlined by the president of the company. A special meeting of the stockholders has been called for April 8 to authorize the issue of these bonds.

The negotiations for the purchase of the Suburban Railway Company by the Metropolitan West Side Elevated Railway Company of Chicago are reported as having been consummated. The money to cover the purchase will not be provided for until the special stockholders' meeting on April 8. It is unofficially stated that the price agreed upon was slightly in excess of \$1,000,000.

The Chicago Edison Company's fiscal year ends with this month and the annual meeting is held in June. Officials of the company decline to discuss earnings of the periods. Interests usually well posted on Edison affairs say that the net earnings of the year will approach the \$1,000,000 mark, and after meeting bond interest and dividends on the stock, there will be a sum of some size applicable to surplus account.

The Union Traction Company, which was incorporated at Trenton, N. J., on the 6th inst, with an authorized capital of \$1,000,000, on Saturday increased its capital to \$15,000,000, of which one-half is preferred with 5 per cent. cumulative dividends. The papers were signed by Ashley T. Cole, of New York, president, and L. B. Grant, of Brooklyn, secretary. The purposes for which the company is incorporated are to construct bridges, buildings, machinery, engines, cars and other railway equipments, waterworks, gas works and electric light and power works.

The United Railways & Electric Company of Baltimore has negotiated with the Mercantile Trust & Deposit Company the sale of \$2,800,000 of its first consolidated mortgage 4 per cent. bonds to be issued by the company and paid for by the Mercantile Trust & Deposit Company as needed for the requirements of the railway company. The proceeds of these bonds will be used to retire maturing underlying 5 and 6 per cent. bonds and pay for the cost of the new central power house and other extensions made by the company. This sale will provide the railway company with all funds necessary to complete the proposed extensions and improvements as originally planned and modified. The only listed bonds of the company which mature this year are \$1,250,000 Baltimore Traction extension and improvement 6s. The improvements contemplated in arranging curves and making extensions, however, will require considerable money.

The management of the Illinois Electric Vehicle Transportation Company has issued a circular announcing that it has been decided to liquidate the company. The assets will be disposed of and the proceeds distributed among the stockholders. Of the capital stock of the company, there has been actually issued 158,620 shares, the amount received on subscriptions being \$793,700. There has been paid out on account of real estate \$50,000 and \$31,760 has been invested in improvement of the same. The expenditures on various other accounts up to February 1 aggregated \$642,588. The gross income to February 1 was \$137,106 and the total operating expenses, \$265,885, showing a loss of \$128,778, with additional loss in depreciation of vehicles and station equipments. The company on the date mentioned had \$205,488 in cash on hand or in bank and now owns 109 vehicles. The consent of the Electric Vehicle Company has been obtained to a cancellation of the contract between the two companies and a settlement of all existing claims and an exchange of mutual releases. A meeting of the stockholders of the Illinois Electric Vehicle Transportation Company has been called for April 4 to ratify such cancellation of contracts.

EDITORIAL NOTES.

Marconi's Object in Visiting This Country.

William Marconi arrived
in this country from Eng-
land last week. His ob-
ject in coming to the
United States—where he

will remain, however, only about three weeks—
is to do for this country what he has already
done for England, namely, equip a number of
stations along the coast with his wireless ap-
paratus, so that the approach of incoming
steamers may be announced long before the
vessels themselves are in sight. Stations of
this nature have already been erected on the
other side at Portsmouth, St. Catherine, Isle
of Wight, Haven Pool, Dorset, Portland and
other points. As is well known, these stations
are of the greatest utility during stormy or
foggy weather, by enabling vessels that are
equipped with Marconi's apparatus to be ap-
prised of their exact location. As yet, however,
but few of the trans-Atlantic liners are pro-
vided with the necessary apparatus for re-
ceiving such information, although his instru-
ments have been installed on many warships.
Twenty-eight British war vessels are so equip-
ped, four Belgian ships, three of the German
Navy, and twenty Italian men-of-war. In this
connection it is Marconi's hope that on this
visit he will be able to reach some understand-
ing with the Navy Department in Washing-
ton looking to the installation of his appar-
atus on ships of the United States Navy. Re-
ferring in a recent interview to the principal
object of his visit, the Italian inventor says:

"I am here to establish signal stations along
the coast so that incoming vessels may be
reported more quickly than they are now.
Some lines are already fitted with my system,
but the North German Lloyd line is the only
one that I can name. With this service com-
munications from vessels 200 miles out to sea
can be received on shore. In England wireless
telegraphy is taken as a matter of course.
It receives no more comment now than the
telephone system. It is in very general use.
About forty English warships are fitted with
the instruments, and good results are obtained.
I hope to induce the United States Navy De-
partment to adopt wireless telegraphy. It is
just as useful in fog and stormy weather as it
is at any other time. I do not think the in-
struments taken to South Africa by the Brit-
ish soldiers yielded many results, for the

reason that the British in the hurry of un-
packing broke or lost them."

Such signaling stations as Marconi proposes
to erect would unquestionably prove of great
advantage to the merchant marine, and it is
therefore to be hoped the matter can be car-
ried in the near future to a successful issue.

* * *

Our English Cousins on the Steel Combination.

Our attention is ar-
rested by an editorial
in the London "*Elec-
trician*," which com-
ments on the late
American combination
of capital and manufacturing interests known
as the "Steel Trust," which has a capital
of \$1,110,000,000. Our esteemed contemporary
is not concerned regarding the probable effect on
American home markets, but is anxious regard-
ing the influence of this "bold combine" on the
British and its Colonial engineering markets,
and fear is expressed that should the "trust"
be sustained it will use the British and other
outside markets "as a convenient dumping
ground for their surplus products, at prices
which will seriously handicap local manufac-
turers." It is also stated that "history shows
that the artificial stability of these enormous
combines is not easily or long maintained."

Without commenting on the effect of Mr. J.
P. Morgan's combination in any way, except its
bearing on the English and other European
markets, we must agree with the "*Electrician*"
that these markets have much to fear for
their former prestige, for these as well as other
combinations are along the direct economic
lines of manufacturing advancement, which
will eventually make the United States su-
preme in international trade, and Europe has
justly much to apprehend from these Ameri-
can combinations, for they will be able to fur-
nish better products, with quicker deliveries,
regardless of the intervening Atlantic and Pa-
cific Oceans, and at a much less price than
foreign manufacturing firms can offer.

European nations have only just commenced
to feel the influence of our manufacturing en-
terprises; this influence is destined to become
more and more pronounced with time and it
will be hopeless for Europe to expect to success-
fully compete except by adopting our methods,
which are the direct outgrowth of restless en-
ergy, superior patent laws, universal free edu-
cation for the masses, untrammelled speech
and action, freedom of the press and political

equality, without a specially favored class rule.

Europe will not give up class precedence, she must therefore suffer the consequences.

Regarding the stability of these combinations we must beg to differ from our esteemed contemporary. Their stability, and consequently our national success, rests on the universal intelligence of the masses who recognize their universal utility. The English workingmen in their trade unions discourage modern improved economical methods, and by so doing they are driving from England her manufacturing supremacy; thus the country must suffer from the lack of foresight and the lack of liberality of its ruling element.

England has not yet thoroughly recognized that the brotherhood of man is the true foundation of national success in this era.

Our Morgans and Carnegies know full well that if their methods are not in conformity with public utility, and that if they are not just in their dealings with the public and their employees, that there is a higher court than the Supreme Court—even though all its judges should be selected by or be in their employ—that would wipe their despotism out of existence.

The United States allows each man free reign to develop his talents for the benefit of the public, and also educates its people to recognize the public utility of these individual talents, consequently all work in harmony for the public good—and it is also well recognized that class or individual selfishness, intolerance or despotism are contrary to public utility.

* * *

Proposed Customs Tariff for the Philippines.

A Commission appointed in Washington to recommend customs tariff for the ports of the Philippine Archipelago has reported. The recommendations relating

to electrical apparatus and machinery are especially interesting, and should be studied by electrical manufacturers interested, as the War Department will be pleased to receive suggestions regarding the proposed tariff up to April 15 next.

It is provided among other things that articles not enumerated in the tariff shall, for the application of duty, be assimilated to those which they most closely resemble, and shall, in the first instance, be so classified by the Collector of the port of entry into which the articles are brought.

When an article presented for customs clearance is not included in the tariff, and when doubts arise as to its assimilation, the interested party or the importer may request the Collector at the port of entry to indicate the number according to which such article is dutiable, and clearance shall be affected in accordance therewith.

When articles are composed of two or more materials, or of different parts, the duty for total weight shall be taxed upon component material of chief value.

Common packing, packages, receptacles and coverings of imported merchandise in use and imported with such merchandise, unless otherwise expressly provided for, shall be admitted free of duty; if any articles so used are in fact imported as merchandise, and have an appreciable value, full duty is to be collected on same; and whenever such articles are of higher value than their contents, they are

always dutiable according to the number of the tariff to which they belong.

Gross weight includes all coverings of whatever nature, without any allowance for tare. Net weight, it is explained, is the weight of the articles exclusive of any and all covering.

When the same package contains two or more articles dutiable on gross weight and paying different rates of duty, the articles most highly taxed shall be dutiable with all their separate packing and with the weight of all exterior packages. The other articles shall be dutiable separately.

The proposed rates of duty on some of the material—of interest to the electrical fraternity—are as follows:

Ampere meters, \$25 per 100 kilos, net weight. Electric batteries, \$3 per 100 kilos, net weight. Storage batteries, \$25 per 100 kilos, net weight. Cables for conducting electricity over public thoroughfares, \$5 per 100 kilos, net weight. Carbon, prepared for electric lighting, \$5 per 100 kilos, gross weight. Copper cables, for conducting electricity, \$5 per 100 kilos, net weight. Copper ingots, \$2 per 100 kilos, net weight. Dynamos, \$5 per 100 kilos, net weight. Electric apparatus and appliances, \$3 per 100 kilos, net weight. Electric arc lamps, \$3 per 100 kilos, net weight. Electric fans, \$3 per 100 kilos, net weight. Electric insulators, of common glass, \$1 per 100 kilos, net weight; of porcelain, \$5 per 100 kilos, net weight. Electric lamps, incandescent, glass or crystal, \$2 per 100. Electric lighting machinery, \$5 per 100 kilos, net weight. Electric power and heat machinery, \$5 per 100 kilos, net weight. Electric stoves, \$3 per 100 kilos, net weight. Galvanometers, \$25 per 100 kilos, net weight. Electric generators, \$5 per 100 kilos, net weight.

Manufacturers having any suggestions to make should forward same to Washington at as early a date as possible, and in any case not later than the date mentioned above.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

At a meeting of the Society of Arts last week in London, Mr. Fritz Behr read an interesting paper on the subject of his mono-rail system, which he is trying to establish between Manchester and Liverpool.

THE next meeting of the New York Electrical Society will be held on Wednesday March 27, when the society will visit the new factory of the New York Electric Vehicle Transportation Company, located at Eighth avenue and Forty-ninth street. It is the intention of the officers of the society to have the working and operation of the vehicles and apparatus explained in detail.

THIS country is to have a National Standardization Bureau, as the late Congress so decreed before final adjournment.

A NOVEL method of predicting the weather has been discovered by Prof. A. Tommasina, a French scientist. He uses for this purpose an instrument, which he has just perfected and which he calls an "electrical radiophone." By means of it he can ascertain the exact nature of the electrical currents in the air at any

moment, since the instrument is fitted with a clockwork arrangement, which registers the precise quality of each current. There are also several bells in the instrument, each of which is bound to ring whenever it is affected by a particular current. If the current is strong, a loud bell rings; if it is weak, only a slight tinkling is heard. Prof. Tommasina claims that this instrument will be found of great service, especially on vessels at sea, since it will prove much more reliable than the present method of ascertaining weather conditions, which is of hardly any use except near a coast. He claims indeed that a vessel, provided with an "electrical radiophone," can ascertain the approach of a storm far away at sea in time to enable the crew to make ample preparations for it. A full account of this ingenious discovery has been sent to the French Academy of Sciences.

A SPECIAL cable dispatch to the N. Y. "Sun," states that the London "Evening News" prints an interview with Mr. C. T. Yerkes in regard to his investments in London underground railways. Mr. Yerkes is quoted as saying: "I have not bought anything except the charter of the Hempstead & Charing Cross Tube Company, and I do not contemplate purchasing anything else. One railway is enough at present. Mr. R. W. Perks, M.P., our solicitor, is also counselor for the underground roads. Perhaps the story that I had purchased the entire underground system of London arose from that fact."

ADVICES from Washington, state that the Post Office Department is experimenting with an electrical registering device for mail boxes introduced to act as a check on carriers. Citizens continually complain that the carriers have not collected the mail regularly from boxes on their routes. By the new device every box is to be connected by wire with the central office, and every time one is opened a signal will be sent to headquarters.

LONDON's first automobile for service in the conveyance of passengers was started last week between Streatham and Clapham Junction. An attempt was made two years ago to run automobile 'buses between Victoria and Kensington. These vehicles were ordinary omnibuses with heavy broad tired iron wheels, but were so noisy and cumbersome that they were as unsuitable for London streets as so many steam rollers and quickly disappeared. The new service deserves to be called automobiles. The carriages are light, smart and comfortable, seating eight passengers inside and one by the side of the driver. This new service affords easy and rapid transit between two populous districts, where there was only a circuitous railway journey, taking twice as long.

Now that the British Government has admitted that it is building submarine boats, the Vickers' Sons and Maxim Company has given out the corrected dimensions of the boats and other particulars. Each will be 63 feet 4 inches long, have 11 feet 9 inches beam, and have a submerged displacement of 120 tons. The main engine, of the gasoline type, will be of 160 horse power. The boats will carry enough fuel to enable them to steam 400 knots. The maximum surface speed will be 9 knots. The main motor will be electric, giving a submerged speed of 7 knots. Means will be provided for expelling torpedoes under a variety

of conditions. The armament will consist of a single torpedo expulsion tube, located in the bow of the vessel. Each boat will be able to carry five torpedoes, each 11 feet 8 inches long.

THE People's Tramway Company of Killingly, Conn., controlled by the New Haven Steam Railway Company, began March 15 operating its great electric plant at Dyer's Dam in Killingly. The dam and works have been 16 months building, and are reported to have cost \$500,000. It is by far the largest electric-power plant in the State, and one of the largest in the country. Besides electric lighting, it will operate before long some thirty miles of trolley lines, including the laterals which are to be used to haul freight to the Norwich and Worcester Division of the New Haven Company.

THE harbor of Newport, R. I., is to be provided with powerful searchlights at each of the new fortifications and garrisons. The work already has taken definite form, and a gang of mechanics about Fort Adams is erecting a power house to contain two generators for the purpose of lighting the batteries, the post, and to supply the searchlights. An appropriation of \$20,000 is available for the work at Fort Adams. The manœuvres of the navy there last summer demonstrated one important fact, if nothing else, and that was the blinding effect of searchlights upon the crews of the ships. The men at the wheel were unable to steer their boats safely, and in these tests they were declared "put out of action" by the searchlights and captured. During the manœuvres next fall in New York Harbor and about the Narrows by the army and navy, tests will be made by the searchlights on the forts and those operated on the ships which will attempt to force an entrance into the harbor. Similar tests will be made in Newport next summer by the North Atlantic Squadron, carrying out some of the problems the War College will have arranged.

W. DUDDELL, an electrician of London, has discovered a method of producing musical sounds from the electric arc, and recently gave a lecture upon these investigations before the London Institution of Electrical Engineers. It is only the solid carbon, that which is homogeneous in its nature, that is capable of producing these unusual sounds. The cored carbons are absolutely silent. Not only is it possible to obtain musical sounds, but they may be varied so as to produce a tune, and to exemplify his thesis the inventor played a popular air. The variations in the sounds are accomplished by a by-pass or shunt placed across the carbons, and which have the same effect as the fingers and keys upon a flute. Mr. Duddell, in the course of his lecture, arranged four arcs in series to increase the intensity of the sound, and by varying the self induction and capacity in the shunt circuit by means of a keyboard, of two octaves, produced his tune. The keyboard may be placed at any distance from the lamps without depreciating the musical effects emitted by the arcs. The inventor has also requisitioned the electric-light arc for receiving telephonic messages transmitted from another point of the building.

With the return to Buffalo, N. Y., of Director General Buchanan from Washington,

the plans for opening the Pan-American Exposition are assuming definite shape. It has been decided that the Exposition shall be opened on May 1. At that time President McKinley and his Cabinet are expected to be on their way to the Pacific Coast. It is proposed to connect the President's train by telegraph with the Temple of Music. Direct telegraphic communication will also be established with the executive offices of the Presidents of all the republics of the Western Hemisphere and the Governor General of Canada. At precisely 2 o'clock, Buffalo time, they will all be requested to touch electric buttons, which will start a piece of machinery of the Exposition. At the same time it is expected they will transmit a message of greeting. President McKinley, from his special car, surrounded by his Cabinet, will then start the great fountain pumps, and will transmit over the wires a message of greeting to the people assembled on the occasion of the opening. The details connected with this novel and remarkable arrangement are being worked out.

The several London electric lighting companies had anything but a cheerful twelve months in 1900. They all added many new customers and did a greatly increased business, but the high cost of coal has troubled them all badly. The fuel bill has in some cases been higher by \$40,000 to \$50,000 for the year. Most of the companies have been spending large sums upon new plants. The Metropolitan Electric Supply Company, whose new station at Willesden was recently described in these columns, is operating its three large Westinghouse generators, and is now putting down two new ones of the same type and size, bringing the capacity of the station up to 12,500 hp. The year has been largely taken up changing over from alternating to continuous current supply to consumers. The outlay has been great but the economy will be greater. The Brompton and Kensington Electricity Supply Company has also been spending a good deal of money scrapping its old horizontal sets and substituting the most modern vertical sets. The old plant took up four or five times as much room as that of the same power which has been installed in its place. The Charing Cross Company, which is now supplying energy within the area of the City Company, has its mains laid in 55 city streets, so that the competition may be expected to grow somewhat keen between the rival concerns.

In an illustrated article contributed to the "Elektrotechnische Zeitschrift," Mr. F. R. Dietze describes in detail the construction of a type of starting switch which since its introduction by a German firm some two years ago has been largely adopted with satisfactory results. A mixture of graphite and carbon is used in this switch as a resistance, whereby exceedingly fine graduation is obtained, in virtue of which the apparatus is claimed to be especially suitable for elevator and crane installations, where the motors must necessarily be started up on load and frequently switched in and out of circuit. It is well known, says the London "Electrical Engineer," that the gradual and uniform withdrawal of resistance from the motor circuit obtained with a very finely graduated controller tends to minimize the sparking and wear at the commutator. The ingenious manner of employing graphite in the form of a

powder as a variable resistance is fully described. It may be mentioned that the switch contact passes through the powdered graphite. The variation, it is claimed, is effected as gradually and uniformly as with a liquid resistance; while the material is not liable, as in the case of a liquid, to either evaporation or decomposition. By adding a larger or smaller proportion of carbon with the graphite, the same apparatus may be adapted to any working pressure between 65 and 600 volts. The author suggests, in conclusion, that in virtue of its incombustibility and other desirable qualities as a variable resistance, graphite admixed with carbon may find further useful applications for switch gears.

ACCORDING to Dr. Eydam, a German physician, there are no more reliable weather prophets than telegraph wires. This novel discovery was made by him in the following manner: As he was waiting for a train at a country station he heard a shrill sound, which was made by the wind as it passed through a network of nearby wires. At once the doctor remembered that he had frequently heard a similar sound either immediately before or after a storm or a heavy fall of rain or snow, and it naturally occurred to him to try and ascertain whether there was any connection between the sound and such changes in the weather. As a heavy shower of rain fell within forty-eight hours after he had heard the sound at the railroad station, he concluded that there was such a connection, and he then determined to investigate the matter thoroughly. As a result he now maintains, first, that any unusual disturbance in the telegraph wires is an infallible indicator of bad weather, and, second, that the nature of the changes in the atmosphere may be learned from the sound which the wind makes when passing through the wires. Thus a deep sound, he says, which is of considerable or medium strength, indicates that there will be slight showers of rain with moderate winds within from thirty to forty-eight hours, and, on the other hand, a sharp, shrill sound is the sure token of a heavy storm, which will be accompanied by much rain or snow.

A GREAT telegraph case is before the Court of Appeals, in Toronto, Ont., and is occupying the attention of nearly all the prominent legal firms of the city. The plaintiff is George Morrow, a Boston broker, and he is suing to set aside a transfer of stock in the Montreal Telegraph Company to the Great Northwestern Telegraph Company, whereby the Western Union Telegraph Company secured control of both companies. He failed before the lower court. It is said that \$20,000,000 of securities are directly and vitally involved in the result of the action and appeal. It is claimed, incidentally, by the plaintiff that the Great Northwestern Company is not earning the 8 per cent. dividend it pays annually to the Montreal Telegraph shareholders, and that the Western Union is making up the deficit and charging it against the Canadian companies.

THE United States Coast and Geodetic Survey has organized a special bureau charged with a magnetic survey of the whole country, including Alaska, the Hawaiian Islands and Porto Rico. Some five hundred stations have already been occupied and the magnetic elements—declination, dip and intensity—have been determined.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 19.

RULES, TABLES AND FORMULÆ.

A workman should thoroughly familiarize himself with the rules and requirements of the National Board of Fire Underwriters before attempting to do any electrical construction.

If a good workman, who has a proper knowledge and understanding of the construction work he intends to do, will follow the dictates of his best judgment there will be no question of the work not complying with the underwriters' requirements. The rules are all based on good engineering practice and are a necessity for the prevention of unreliable and dangerous work.

The following are a few of the more important suggestions given in the code and are applicable to all electric light, heat or power construction.

In all electric work conductors, however well insulated, should be treated as bare, to the end that under no conditions, existing or likely to exist, can a grounding or short circuit occur, and so that all leakage from conductor to conductor, or between conductor and ground, may be reduced to the minimum.

In all wiring special attention must be paid to the mechanical execution of the work. Careful and neat running, connecting, soldering, taping of conductors and securing and attaching of fittings, are specially conducive to security and efficiency, and will be strongly insisted upon.

Wires must not be of smaller size than No. 14 B & S., except when used for wiring fixtures or by special permission. Wires must be separated from contact with walls, floors, timbers or partitions through which they may pass by non-combustible, non-absorptive insulating tubes, such as glass or porcelain. Bushings must be long enough to bush the entire length of the hole in one continuous piece.

Transformers must not be placed inside of any building, excepting central stations, unless by special permission of the inspection department having jurisdiction. They must not be attached to the outside walls of buildings, unless separated therefrom by substantial supports.

Switches must be placed on all service wires, either overhead or underground, in a readily accessible place, as nearly as possible to the point where the wires enter the building, and arranged to cut off the entire current. Knife switches must be so placed that gravity will tend to open rather than close the switch. They must not be single-pole, except where the circuits which they control supply not more than six 16 cp. lamps or their equivalent.

Automatic fuse cut-outs must be placed on all service wires, either overhead or underground, as nearly as possible to the point where they enter the building and inside the walls, and arranged to cut off the entire current from the building. They must be placed at every

point, throughout a system, where a change is made in the size of wire (unless the cut-out in the larger wire will protect the smaller). All cut-outs must be in plain sight, or inclosed in an approved box, and readily accessible. They must not be placed in the canopies or shells of fixtures.

Circuits or groups of incandescent lamps requiring more than 660 watts must not be dependent on one cut-out. Special permission may be secured for departure from this rule in case of large chandeliers, stage borders and illuminated signs.

No fuse must have a rated capacity exceeding the allowable carrying capacity of the wire it protects.

In open work wiring, supports must be placed at no greater distance than 4½ feet apart.

When wires are run in wooden moulding the moulding must have at least two coats of waterproof paint.

Flexible cord must not be used except for pendants, wiring of fixtures and portable lamps or motors. It must not be used as a support for clusters.

The following is a table showing the safe carrying capacity of conductors of different sizes in B. & S. gauge as given in the rules.

B. & S. G.	Rubber-covered wires.		Weatherproof wires.		Circular Mils.

SOME CONVENIENT FORMULÆ.

To measure resistance by the use of a voltmeter, connect the voltmeter across the terminals of any constant current, noting the reading; then connect the unknown resistance in series with the voltmeter across the terminals, which will then give a lower reading than the first. Now the following formula may be used. Divide the first reading by the second reading, then multiply by the resistance of the voltmeter, then from the result subtract the resistance of the voltmeter and the result obtained will be the ohms resistance of what is being measured. For example, suppose the first reading be 20 volts and the second after the resistance has been placed in series be only 10 volts, and the resistance of the voltmeter

$$20 \div 10 = 2 \times 1,000 = 2,000 \text{ ohms.}$$

which would be the resistance of that which is being measured.

To measure the amount of current flowing in a circuit by the use of a voltmeter, place a known resistance in the circuit and measure the difference of potential between its ends. The volts so indicated, divided by the known resistance, will give the number of amperes flowing. For example, suppose a known resistance of 5 ohms be placed in a circuit and the difference of potential between its two terminals is 20 volts, then the amount of current flowing in the circuit would be $20 \div 5 = 4$ amperes.

To measure resistance by an ammeter, place

the ammeter in series with the circuit to which is applied a known voltage, then divide the voltage by the number of amperes indicated, which will give the resistance. For example, suppose there be a voltage of 100 and a current flow of 2 amperes then the resistance must be $100 \div 2 = 50$ ohms.

To measure voltage by an ammeter, place a known resistance in series with the ammeter across the circuit then the current so indicated multiplied by the known resistance will give the voltage of the circuit. For example, suppose a resistance of 10 ohms be placed in series with an ammeter across a circuit and the current indicated be 3 amperes, then the voltage must be $10 \times 3 = 30$ volts.

By the use of properly calibrated instruments constructed with a sufficiently fine scale these rules will apply accurately enough for all practical purposes.

The following table will be found very useful to anyone designing switchboards.

Bus-bars are generally selected by the current which they have to carry.

Two copper bars bolted together will carry about 180 amperes per square inch of contact section. Copper will carry approximately 1,200 amperes per square inch of cross section.

DIMENSIONS, ETC., FOR COPPER BUS-BARS.

Size in inches.	Amperes Capacity.	Circular mils.	Square mils.	Ohms per foot.
1 x ½	433	318,310	250,000	.0000336 .97
1½ x ½	530	397,290	312,000	.0000269 1.21

Article No. 20 will be entitled "The Telephone and Telephone Practice."

Automobile Carriages in War.

Concerning the use of automobile carriages in war, the "Italia Militaire e Marina" observes that the report is most interesting which was recently presented to the French Minister for War by the officers to whom had been entrusted the duty of reporting upon the automobiles which had been employed during the grand army manœuvres. To begin with, they expressed themselves fully convinced of the utility of the new means of transport, of which the advantages may be summed up as follows: The automobile can, at a high rate of speed, convey officers of high rank, whose physical condition does not allow them to remain very long on horseback, from point to point wherever they may desire to personally give orders and superintend the conduct of operations. By means of the automobile general officers would thus be enabled to personally supervise a long line of troops. Equally useful are the services which the automobile can render in the rapid transmission of orders, plans, and things from one corps to another, especially with the petroleum tricycles of the general staff. The motors of the automobiles can also render no unimportant service as regards the dynamos of projectors used at night in the encampments, the automobile thus becoming a rapidly transportable lighthouse.

POLYPHASE POWER PLANTS IN RUSSIA.

BY FRANK C. PERKINS.

The introduction of polyphase alternating current apparatus in Russia has been very extensive during the past few years, as it has in all other parts of Europe, and one of the leading electrical manufacturing firms that has aided in the extensive introduction of this class of apparatus is the well-known Swiss and German firm of Brown, Boveri & Cie, of Baden. One of the largest installations in Russia is the great central station installed by this firm at St. Petersburg for the Société Russe pour l'Exploitation de la Force Electrique of that city. The accompanying illustration shows the engine and generator room of this station with the measuring instruments, generator and distribution switchboard in the background.

The central station at St. Petersburg has a

ing three-phase alternating current machines with great success for some time and is using a number of polyphase motors for driving conveyors, elevators, cranes and various other machinery. This generator room is supplied with 1,000 hp., consisting of four generators of 250 hp. each of the Brown, Boveri design. In Moscow, Russia, a large amount of three-phase apparatus is in use. At the Balischinskaya Works alone nearly 2,000 hp. is required. In this station direct connected engines operate two polyphase generators of 1,600 hp. and 200 hp. respectively, and the motors vary in capacity from 140 hp. and 70 hp. down to 5 hp.

The waterworks plant at Moscow is operated entirely by three-phase motors of the vertical type, directly connected to the pumps. There are twenty of these motors which are of special design for this particular purpose, each of which has a capacity of 20 hp. The waterworks generating plant is designed for a total

idea of the varied uses to which this class of apparatus is put in Russia, and then only a tithe of what one important firm has installed. Other firms have also made many important installations in Russia and the future should give American manufacturers an opportunity to introduce many American machines.

M. GUARINI'S WIRELESS TELEGRAPH EXPERIMENTS IN BELGIUM.*

M. Guarini is still carrying out miscellaneous experiments between Brussels and Malines (13½ miles), and Malines and Antwerp (14 miles). On February 8 he made some tests between the Colonne du Congrès, at Brussels, and the Cathedral of St. Rombaut, Malines, as before, but on this occasion he took the latter point as a transmitting station. He used the same apparatus as before, but his air-wires were different. Since his last experiment storms have broken these, and he now profited by this circumstance to make experiments with a different type of air-wire.

At the transmitting station (Malines) he used the ordinary air-wire with a single cable, but at the receiving point the cylinder of 50 metallic wires of 4 mm. diameter which formerly constituted the upper part of the air-wire was replaced by a cone whose apex was turned towards the ground and connected to earth by a single cable. The cone was formed by 50 wires of 0.4 mm. diameter. The single cable leading from the ground to the apex of the cone extended right through the cone axially to the top of the air-wire. This arrangement is sketched in Fig. 1. At first communication was bad. M. Guarini only receiving at Brussels a very small part of the signals transmitted from Malines, while communicating in the inverse direction he received at Malines all the signals transmitted at Brussels. An analogous effect, he says, had already been observed last year in Paris when telegraphing without wires between the Eiffel Tower and the Pantheon, when it was found that the tower acted very well as a transmitter but gave no results as a receiver. He attributes this to the presence of metallic masses on the monument—the bronze statue of Leopold I at the top, the metal balustrade round the platform, the bannister of the staircase in the interior of the column, the statues at the base, etc. Only on doubling the source of electrical energy at Malines and employing an extra sensitive Blondel coherer at Brussels could he obtain irreproachable transmission. He also found that, other things being equal, the maximum effect was obtained if the air-wires were so placed that the vertical plane connecting them or its prolongation did not meet the column and spire to which the wires were attached (see Fig. 4.) Other experiments show that the sensitiveness of a coherer for a particular wave increases on diminishing the local current in its circuit by using appropriate resistances.

Finally he made experiments to determine the importance of the earth connection. As might be expected, if neither of the stations were connected to earth, or if the receiving station only was connected to earth, no good signals could be transmitted, but with the ordinary earth connection at the transmitting station he found the results better when the receiving wire was not connected to earth than

*From the "Electrician," London.

ENGINE AND GENERATOR ROOM AT ST. PETERSBURG, RUSSIA.

total capacity of 7,540 hp. and is equipped with vertical compound engines, of 200, 300, 340 and 500 horse power capacity. There are thirteen of these units, each directly connected to a three-phase alternating current generator of corresponding capacity of the Brown, Boveri type. The exciters are continuous current machines of the bipolar type, each of which is directly connected to the end of the alternating current generator and engine shaft nearest the center aisle of the station. The power house of the Kew Tramways is also equipped with polyphase apparatus. This plant has a total of 1,800 hp., which consists of one three-phase alternator of 900 hp. and one 900 hp. continuous current traction generator, both of which are directly coupled to compound condensing engines.

The Tanbov Station of the Riazan-Ural Railway has been equipped with polyphase apparatus of a capacity of 720 hp. In this power house two horizontal compound steam engines are used, each delivering 360 hp., directly coupled to two three-phase flywheel generators. The current from this plant is used as well for operating polyphase motors, driving machine lathes, planers, etc.

The power station for the Port of Noworosisk of the Wladikawkas Railway has been operat-

capacity of 900 hp. and has one three-phase generator of 250 hp. for rope driving and two polyphase alternators of 325 hp., each directly connected to a steam engine.

In addition to the several lines of work just mentioned to which this class of alternating current apparatus has been applied, there are many other important plants, including the St. Petersburg tube rolling mills and the many spinning and weaving mills throughout Russia. Among the more important installations for the latter industry is that of Prochoroff at Moscow. This power station has a capacity of 2,600 hp., consisting of two three-phase generators of 1,000 hp. each and one generator of 1,600 hp. These are all directly connected to horizontal compound condensing steam engines and supply current for a large number of polyphase motors for single and group driving of self-actors, ring-spinning frames, card machines, etc. The St. Petersburg tube rolling mills plant above referred to has a station of 540 hp. capacity and is equipped with three three-phase generators and two continuous current machines each of 108 hp. for belt driving. These machines furnish direct and alternating current for lighting and operating motors for driving the rolling mills and machine tools. The above will give the reader a slight

when it was. M. Guarini thinks the explanation of this is that earthing one of the balls of the oscillator increases the potential of the ball connected to the air-wire, and determines the position of a point of maximum vibration at the summit of the transmitting

2 to 2½ amperes at the transmitting station, good results were obtained.

On removing the earth connection from the receiver, however, the results were not so good as those between Brussels and Malines. M. Guarini attributes this to the absence of the

In experiments in the inverse direction, from Antwerp to Malines, communication was, in general, less good. M. Guarini attributes this to two causes. First, a violent wind which deflected the transmitting air-wire at Antwerp to such an extent that parallelism between the two wires was quite destroyed, and, secondly, the enormous metallic masses about the Antwerp Cathedral. With regard to the first cause, in the Malines-Antwerp experiments, the relative positions of the air-wire were as in Fig. 7, that is to say, the receiving air-wire at Antwerp was entirely included between the two planes normal to the wire at Malines, and passing through its extremities; whilst from Antwerp to Malines the planes normal to the Antwerp wire only cut part of the Malines wire (Fig 8). Signals could also be received with the transmitter connection of Fig. 5. In this case it was an advantage to add a capacity at the top of the air-wire.

FIG. 1.—BRUSSELS.

FIG. 2.—MALINES.

FIG. 3.—ANTWERP.

wire, i.e., at the part most in sight of the receiving wire, while, on the other hand, by insulating the coherer one forms a maximum vibration at the point of the receiving air-wire where the coherer is inserted. He concludes that the earth acts as a large capacity and not as a conductor, this large capacity being advantageous to the transmitter, but harmful in the case of a receiver.

On February 12, M. Guarini experimented between Malines and Antwerp. The transmitting station at Malines was at the Cathedral of St. Rombaut, as before, and at Antwerp the tower of the Church of Notre Dame was employed. The same apparatus was used as in the previous experiments. Simple air-wires were adopted, without capacity at their upper ends. Figs. 2 and 3 show the air-wires at Malines and Antwerp respectively. In the latter case certain difficulties were encountered, owing to the more or less pyramidal shape of the tower of Notre Dame. M. Guarini made up a sort of fishing rod, composed of three pieces of bamboo cane, jointed with metal rings, and fastened this securely on the third gallery. At the extremity of this rod a ring of 7 wires of 0.9 mm. diameter was fixed, and descended in as nearly a vertical direction

FIG. 4.

as possible to the height of the roof, i.e., about 40 meters from the ground (the third gallery is 106 meters above the ground, or 112 meters above sea level). From this point the wire was slanting to the receiving apparatus, which was placed in a neighboring house. The coherer was of the Blondel pattern, and the earth-wire was formed by three metallic wires connected to a street lamp post.

Between the two air-wires were the groups of houses in Malines and Antwerp, some villages and castles, and undulations from 5 meters to 30 meters in height. With current from

capacity in the upper part of the receiving air-wire in the present case.

Another interesting observation is worth recording. The oscillator at Malines was removed and the air-wire connected to one terminal of the secondary of the induction coil, the

FIG. 5.

FIG. 6.

other terminal of the secondary being earthed. With these connections (Fig. 5) 12 signals were transmitted, three of which were clearly received at Antwerp. This, M. Guarini points out, constitutes wireless telegraphy in accordance with Edison's American patent 465,971 of 1891, with the difference that the receiving apparatus included a coherer. On removing the

FIG. 7.

FIG. 8.

earth connection from the coherer (Fig. 6) in this case also signals were still received.

ELECTRO-METALLURGY IN EUROPE IN 1900.

BY JOHN B. C. KERSHAW,
London.

ALUMINUM.

The number of factories producing this metal in Europe has now been increased to six by the completion of the new factory of the Société Anonyme pour l'Industrie de l'Aluminium at Lend Gasteln in Austria. The 5,000 hp. developed at this place is derived from the River Achen which here makes a fall of over 200 feet. About 46,000 hp. is available for aluminum production in Europe, the six factories being situated as follows: Foyers, Neuhausen, St. Michel, Le Pranz, Rheinfelden and Lend Gasteln. The power named above is equivalent to an output of 16,000 tons per year, but all the six factories utilize a portion of their power in manufacture of other products, and the output of aluminum in Europe in 1900 is believed by the writer to have been about 2,500 tons. However, as official information is refused, no very reliable estimate is possible.

The Herault process is employed at five of these factories and a modification of the Hall process is believed to be in operation at St. Michel. The Peniakoff process, which depended upon the substitution of aluminum sulphide for the oxide in the decomposing pots, has not proved economically successful, and only alumina and its salts are manufactured at the Peniakoff factories in France and Belgium.

The utilization of aluminum in Europe is only slowly extending, and this slow growth of the demand for the new metal is the chief reason for the comparative stagnation of production. The trials of the new metal for electrical purposes, have not been so successful in Europe as across the Atlantic. This outlet for the metal has therefore only absorbed a few tons, as compared with hundreds of tons in the United States. In a paper recently read before the London Institution of Electrical Engineers (see *ELECTRICITY*, January 30, 1901) the writer has given the results of independent investigations relative to the durability of aluminum under atmospheric exposure, and has explained the cautious attitude of English engineers towards this use of the metal.

Alloys of aluminum are now attracting more attention in Europe, and in France companies have been formed to manufacture special alloys for which a considerable sale is expected.

Partinium, albradium, and magnalium, are the best known of these.

Heraeus of Hanau in Germany has recently perfected a process of jointing aluminum, which it is hoped will facilitate the adoption of the metal for stills and similar vessels in chemical works. The new method depends upon the welding of the two edges or surfaces, at a temperature below 700°C ., it having been found that at a certain temperature the metal becomes plastic and can be kneaded. Joints made in this way have stood severe tests without failure.

The Goldschmidt process for reducing refractory oxides and for producing high temperatures by use of aluminum powder is now industrially operated in Germany and France, and this minor industry is likely to lead to an increasing demand for aluminum of third or fourth grade quality. In France a low grade metal containing only 90 per cent. aluminum

sumption of copper for electrical purposes, places it at 300,000 tons, or 64 per cent. of the total supply of the metal.

The output of electrolytic copper in 1900 is estimated to have been 210,000 tons, to which total America contributed 172,000 tons and Europe 38,000 tons. The European refineries are all hampered by difficulty in obtaining raw copper suitable for refining by the electrolytic method, and it is this fact which accounts for the comparatively small output of the 31 refineries on this side of the Atlantic.

Nothing has been published during 1900 concerning the Doumoulin and Cowper-Coles processes for depositing tubes and other hollow articles by electrolysis, and it would seem doubtful whether any of these processes when operated on an industrial scale are as commercially successful as the inventors hoped. The Hoepfner process for extracting copper and nickel

electric currents are now in operation in Europe and America. At Sault Sainte Marie, in Canada, ferro-nickel alloys containing 7 per cent nickel have been produced from the ores of the Sudbury district by direct smelting in the Clergue electric arc furnace. Krupp of Essen is said to be interested in the further industrial development of this process. At Hamilton, Ont., the Frasch electrolytic extraction process is receiving trial. In this process, the crushed ore is used as anode material in an electrolyte of sodium chloride. Solutions of sodium hydrate and of the chlorides of the metals present in the ore are obtained, and the latter solution is then electrolyzed with carbon anodes to separate the copper and other metals.

At Papenburg in Germany the Hoepfner process is being operated upon an industrial scale. The copper-nickel ores are roasted, crushed and leached with a solution containing copper and calcium chlorides. The resultant solution is then electrolyzed with carbon anodes and copper cathodes to remove the copper. When the nickel present in solution has risen to 10 per cent., the copper, iron and lead remaining are removed by chemical means, and the solution containing now only nickel chloride is electrolyzed with nickel cathodes in order to separate the nickel.

Nickel is refined electrolytically by T. Bolton & Sons in England, by G. Menne & Co. in Germany, and by Nikolajev in Russia. The method adopted is similar to that used in copper refining. The deposition of thick plates without foliation can be obtained by raising the temperature of the solution to 60°C ., or by using the process referred to in the January, 1901, issue of the "Elektrochemische Zeitschrift." The Mond extraction process, for the operation of which a large works is now being erected at Clydach in South Wales, is not an electrical process. The nickel is extracted from the ore as a gaseous product (nickel carbonyl) by passing carbon monoxide gas over the heated ore, after reduction of the nickel to the metallic state.

SILVER AND GOLD.

There is nothing new to report concerning the progress in the bullion refining industry, beyond the fact that a new factory is being erected by the Frankfort Gold-u. Silber-Scheide Anstalt in Sweden, presumably for the operation of the Rössler bullion refining process. Only three electrolytic refineries for the treatment of silver and gold alloys are known to the writer in Europe, namely, at Hamburg, Frankfort and Pforzheim, in Germany. The first uses the Wohlwill process, the second the Rössler process, and the last the Dietzel process. In the United States there are four refineries, at three of which the Moebius process is in use.

Though the industry of bullion refining is thus a very limited one, it is believed to be one of the most profitable of the electro-metallurgical industries, and it is difficult to explain why it should be confined to two countries.

As regards gold extraction from its ores, the progress of the Siemens & Halske process for obtaining the gold from cyanide solutions by electrolysis had been somewhat checked in the gold mining districts of South Africa before the outbreak of the war, by the adoption of improved methods for operating the older zinc process, and the war has of course entirely stopped all work at the mines in the rand.

GENERATING PLANT AT THE ELECTRICAL COPPER COMPANY'S WORKS, WIDNES, ENG.

is now being manufactured specially for use in this industry, and is sold at 17.4 cents per pound.

COPPER.

The year 1900 has not been characterized by any startling developments in the electrolytic copper industry. The price of copper in Europe has varied between \$346 and \$370 per ton for G. M. B.'s during the year, and an increasing demand for the metal for electrical purposes has assisted the Amalgamated Copper Company of New Jersey in keeping its control of the market. The new mining companies floated in London in 1899 and 1900 have not materially improved the situation, and the copper shipped to English and French ports from outside sources during the year 1900 has, according to Messrs. H. R. Merton & Co., only totalled 45,919 tons as against 46,868 tons in 1899. The very great activity now displayed in the United Kingdom as regards electric tramway and railway development is also playing into the hands of the copper financiers, and it seems improbable that any marked fall in the price of copper will occur during the present year. A recent estimate of the world's con-

sumption of copper for electrical purposes, places it at 300,000 tons, or 64 per cent. of the total supply of the metal. The output of electrolytic copper in 1900 is estimated to have been 210,000 tons, to which total America contributed 172,000 tons and Europe 38,000 tons. The European refineries are all hampered by difficulty in obtaining raw copper suitable for refining by the electrolytic method, and it is this fact which accounts for the comparatively small output of the 31 refineries on this side of the Atlantic. Nothing has been published during 1900 concerning the Doumoulin and Cowper-Coles processes for depositing tubes and other hollow articles by electrolysis, and it would seem doubtful whether any of these processes when operated on an industrial scale are as commercially successful as the inventors hoped. The Hoepfner process for extracting copper and nickel

NICKEL.

The year 1900 has been marked by considerable activity in connection with processes for the extraction of nickel from its ores. Nickel steel is now being used largely for armor plates, and the important changes which the addition of nickel brings about in the physical characteristics of iron and steel are also being made use of in the manufacture of alloys for various purposes. The world's output of nickel in 1899 was estimated to amount to 7,350 tons, and that for 1900 will no doubt exceed this total. The greater portion of this amount is still extracted and refined by the older metallurgical processes, but methods involving the use of

In Australia, however, the Siemens & Halske electrolytic process is receiving trial.

None of the methods for using electrolysis to assist the action of cyanide or other solutions, upon the gold bearing quartz or tailings, can yet be considered a practical success, although numerous patents have been taken out. The Pelitan-Clerici process is receiving trial in British Columbia, while the Riecken process is receiving trial in West Australia. Both processes depend upon the use of a solution of potassium cyanide and sodium chloride as electrolyte, with mercury as cathode. The writer has not seen any definite statements concerning the results of these trials.

ZINC.

The various processes for the extraction of zinc from its ores by aid of electrolysis have

improved process consists in the mixture of the pulverized ore with fused zinc chloride; the conversion of the metals into chlorides by pumping chlorine gas through the fused mass; and electrolysis of the fused metallic chlorides in a separate vessel after decantation from the insoluble residue. A small syndicate (the "Phoenix Process Syndicate," capital \$48,000) is carrying out these trials at Milton, and if success attends them, the future prosperity of the process would seem to be assured.

Two other processes for extracting the metallic constituents from mixed sulphide ores have recently been worked out in England, namely, the Fry and the Ellerhausen processes; but these as regards their primary reactions are ordinary metallurgical processes, and therefore not within the domain of this review. In each

seven hours to transmit the first signal through to the terminus station. By using the retransmitter Signor Guarini says that the first signal will be repeated automatically from one station to another and get through the whole distance in a few seconds, and the whole message in little more than the time required for transmitting to the first station.

The experimental Brussels-Paris line will cost about \$20,000. The retransmitter has been installed at Malines, and is working satisfactorily.

ALUMINUM MAINS IN PRACTICE.*

It may prove interesting to state observations taken on an installation of aluminum wires, as mains of an overhead system of distribution, used in the small town of Northallerton, in Yorkshire. This station, owned by the Northallerton Electric Light and Power Company, Limited, was inaugurated in the autumn of 1899, and to keep the first cost as low as possible, aluminum was adopted for the main distributors. From the generating station two aluminum wires, .75 inch in diameter, were erected overhead on both sides of the main street, which is very wide, the private consumers being directly coupled to these two mains, negative and positive respectively.

The public lighting of arc lamps was taken off the negative aluminum, and a positive switch wire of copper was taken back overhead to the station. When the arc lamps were switched out at a certain hour, incandescent lamps fixed on the same poles were switched on by another switch wire, one pole of the incandescent lamps being connected to the negative aluminum, and the other pole to a positive switch wire of copper, which was taken overhead to the station. These wires being stretched side by side, it was convenient to observe their relative actions under practical working conditions.

The steel posts for the suspension of these wires were placed at the maximum distance apart, namely, 200 feet. The aluminum spanned this distance very neatly, and in this respect was better than copper, but its appearance was very ugly, owing to its increased diameter. This span of 200 feet seems quite safe, and no accident of wires falling has taken place. These wires have been subject to severe trials in gales and storms, and even when covered with snow they have suffered no injury. The wire used is the ordinary commercial aluminum metal supplied by the British Aluminum Company. The aluminum procured had a conductivity of 51 per cent., taking copper equal to 100, and its chemical composition being 98.1 per cent. aluminum, the remaining part of 1.9 per cent. being an impurity, the greater part being iron. By practice, however, it is found that a span of 150 feet is the most suitable and reliable.

The jointing of the aluminum ends was done by an ordinary brass socket. A piece of yellow brass, 2 inches by 1.25 inches in diameter, was taken, and a hole bored right through it; this hole was tapped (Whitworth thread being used), the brass socket was then screwed on both ends of the aluminum. This joint has been very successful mechanically, and no failures have occurred in the joints made in this manner. The joint is subject to corrosion, but it is this corrosion which, peculiar to state,

*A communication in the "Electrical Review," London.

DEPOSITING VATS AT THE ELECTRICAL COOPER COMPANY'S WORKS, WILNES, ENG.

not emerged during 1900 from the experimental stages of their existence, with the one exception of the Hoepfner process. This process is in operation at the Winnington Works of Messrs. Brunner Mond & Co., in Cheshire, England, and also at Hruschau in Austrian Silicia. The zinc plant at the first named works is being extended, and electrolytic zinc obtained by this process was exhibited at the Paris Exhibition, so the method must be regarded as a practical success. Hoepfner has taken out so many patents relating to the extraction of zinc and other metal from their ores that it is difficult to arrive at the details of the process used. It is believed, however, that at Winnington zinc chloride solutions are obtained by aid of the waste calcium liquors from the ammonia soda process, and that these are electrolyzed in vats containing diaphragms and carbon anodes. The chlorine is thus obtained in the gaseous state, and can be used for the manufacture of chlorine products.

The Cowper-Coles extraction process, so far as the writer is aware, is not being operated upon an industrial scale at any place in England at present, and as the process is on the same lines as the discredited Ashcroft process, its ultimate success would seem doubtful.

The Swinburne dry fusion process has reached the second stage in its development, and the improved process is now being tried upon a small industrial scale at Milton in Staffordshire, with mixed sulphide ores supplied by the Tasmanian Copper Company. The

case, however, it is possible that electrolysis may ultimately be used for obtaining the zinc. Experimental work is now being carried on for the Fry process with reference to the electrolytic treatment of the zinc oxide obtained by the metallurgical portion of the process. The method now being tried consists in the electrolysis of a molten bath of zinc chloride into which the zinc oxide is fed, and the method is therefore somewhat similar to that patented by Swinburne.

There is nothing new to report in 1900 concerning the electro-galvanizing industry.

Wireless Telegraphy to be Tried Between Paris and Brussels.

Signor Guarini, the Italian electrician, who has been experimenting in Belgium with his wireless telegraphy apparatus, is now going to try and establish communication between Brussels and Paris. The distance, as the crow flies, is 171 miles, and therefore largely exceeds any attempt of a like kind hitherto made on land. The inventor proposes to use his patent retransmitters every seventeen miles, and they will be erected at the following places: Braine-le-Comte, Mons, Berlaimont, Wassigny, Moy, Coucy-le-Chateau, Villers-Cotterets, Betz and Mitry.

In order to telegraph direct from Brussels to Paris the antennae or pole apparatus would have to be placed at an elevation of 1,600 yards, with only three intermediary stations; a message would take an hour to manipulate and

makes it so mechanically safe. Joints were cut out and tested mechanically, and in all cases the aluminum could not be screwed out of the brass socket, and to open the joint the socket had to be sawn through. These joints were then placed in a testing machine, and in all cases the wire itself broke before the joint gave way, the tensile strength being equal to 16 tons per square inch. On close examination of the joint, a dark white oxide was present, and this was distributed over all the surface, and not a clear metallic surface was visible. It appeared evident that the joints had firmly oxidized together, though to no detrimental degree mechanically, but a rise in resistance was noticed in these joints when they were measured. A series of electrical tests was then made upon two sets of these joints. One set of joints was taken as samples after they had been made for one week, and the other set after they had been up, in practical use, for 12 months. In all cases it was found that the resistance of the old joints had increased 350 to 580 per cent. that of the new joints. It seems evident that, after a space of time, these joints will become total non-conductors, due to a complete film of oxide separating the two metals. But this time period will depend upon the tightness or fit of the metals. A badly-made joint may only last a short time, but a well-made one may last for years. After 15 months' working at Northallerton there has been no trouble through the joints discontinuing to conduct.

Through the above aluminum conductors and joints a current exceeding 200 amperes is passed at times of heavy load, and several joints were under observation, but no trouble arose, nor did any perceptible heating take place. The surface of the aluminum showed signs of oxidation or corrosion. It seemed pitted and eaten away more in some places than others, and all over the surface showed a darkish white deposit of oxide. The air at Northallerton, in Yorkshire, is said to be fairly pure; but the air is only one consideration, for the corrosion on the wires greatly depends upon the condition of the atmosphere. For instance, periodic sunshine and rain do more harm in assisting corrosion than a lengthy period of rain and sunshine; this is only natural, and is very marked in actual practice. Cases have come under observation where, during a rain storm, a good circuit was maintained through a joint, but after the rain ceased and the sun commenced to shine, the joint lost its conductivity, and finally was no good at all. The joint that was most affected by the above conditions was a copper and aluminum joint, and two aluminum joints were nearly as bad. The services of copper wire were taken off the main aluminums, and led overhead to insulators placed on the consumer's house wall. The greatest trouble experienced was with these joints, the copper wire being wrapped and bound round the aluminum, then insulated and protected from the weather by rubber tape and insulating paint. This class of joint was found the most lasting and suitable, but it gave trouble. The sun and rain used to play havoc with the joint, till finally it gave way. The greater part of these joints that ceased to conduct, ceased instantly, and it was no common occurrence on a windy night to have the consumer's lights bobbing up and down through these defective joints. A number of these fagged-out joints were examined, and although they were found to be perfectly tight they ceased to conduct, and on the resistance

being measured it was found to vary between 100,000 ohms and 2 megohms. Some of these copper wires that had been twisted round the aluminum were found to be strongly welded to it by the oxide, and by observation it looked to be a very good joint. The average life of this class of joint was about six months, and in no instance has a joint made between copper and aluminum been satisfactory. It remains to be seen whether a soldered joint will be as good mechanically and electrically as an ordinary made up joint. Soldering aluminum is simply melting it together, and it does not seem feasible that the melted joint will be as strong as a made up one; electrically it may be inferior. Soldered joints have never been tried at Northallerton, as the expense of trials would be too great, and most probably have led to inconvenience.

The copper mains have proved very satisfactory, and joints made by the hands, and left bare to atmospheric conditions, have given no trouble, and when measured electrically, under the same conditions as the aluminum, the increase of resistance was found to be only 5 per cent. The joints were found to be in a very good condition after being up under working conditions for over 12 months. With the copper mains, joints could be freely made by a man in a short space of time. With aluminum mains, to make a good joint took an experienced man twice as long, and then it could not be relied upon to last any length of time. It has been proved by actual experience that to use aluminum mains for distribution, the cost of same, including maintenance for a given period, exceeds that of copper under the same conditions. It can be said that aluminum is cheaper than copper, but this only holds good for the first cost, or cost of material. To place aluminum wires overhead requires experience and care, and the time taken during the operations amount to four times that of placing copper mains in position, that is when the conditions suitable for the erection of aluminum is at its very best. The maintenance, upkeep, etc., not mentioning the unreliability, etc., raises its total cost after one year to an amount equal to 10 per cent. of the total cost of copper installation under the same conditions, and this has been proved by actual experience. The general information obtainable simply states that aluminum is cheaper than copper for this purpose, but it omits the cost of erection and maintenance, which seem the two most important factors of the cost and success of the system after a period of time. From experience gained it seems evident that aluminum will be left alone when copper can be obtained and used for overhead constructional work. In an aluminum installation its first cost is less than a similar one of copper, but after one year's work its cost then exceeds that of the copper installation. It is very evident from experience gained by actual practical work on commercial lines that aluminum wire as an overhead conductor is very unsatisfactory. Of course, if this experience had been known at first, copper would have taken the place of aluminum in the above mentioned installation. Experience is a dear school, but it is the best.

CLARENCE MALTHANER, of the Mississippi Valley Telephone Company, has secured a patent on a new invention—a "trunking circuit"—which it is said materially facilitates long distance telephoning. The device consists of

the use of two condensers instead of repeating coils, which are used by the Bell system. By this method one may telephone to St. Paul almost as quickly as to any part of Minneapolis.

LONDON NOTES.

(From our London Correspondent.)

100 vs. 200 Volt Supply.

The long-expressed desire on the part of the London electric lighting companies to be placed in a position to compel consumers to change over from 100 to 200 volt supply, is forming the subject of a public inquiry now being held by the Board of Trade at Westminster. In one or two cases suppliers of electricity have been unable to obtain the economical advantages of supplying energy at the higher pressure, purely because two or three consumers have refused to concede to the wishes of the company. The companies have held out great inducements but without success. It will be evident that as the regulations now stand one or two such consumers are acting within their legal rights when they hinder the lighting authority from effecting very large saving in capital outlay and operating charges. The London County Council has ranged itself on the side of the consumers. The inquiry is practically set on foot by the action of the Westminster Electric Supply Corporation which has 5,500 consumers, all of whom are taking supply at 200 volts with the exception of eight. The corporation is at present therefore furnishing these eight consumers, scattered over a large district, at 100 volts. These eight are charged the maximum rate of supply permitted by regulation viz., 8d., but there is a considerable loss incurred. Already to make the conversion for other consumers, the corporation has expended about £45,000. These eight consumers are endeavoring now to dictate to the corporation the amount which shall be paid to them for agreeing to take 200 volts supply. The corporation resists this absolutely. The evidence given by Prof. Alexander Kennedy, the company's engineer, showed that in 1895 he advised making the change over to 200, and it was in 1897 that the change over commenced. He thought it was a mistake to think that there was any danger to the consumer from shock on account of the higher voltage. Nor did he think the danger from fire was greater, because more pains were taken about the fittings and the installation generally. There was a great saving in the loss by transmission when a high voltage was used, as compared with a low voltage. Their distribution loss at first was about 12½ per cent., but if they could change the whole of their system to 200 volt pressure, they could go on with a very much lessened loss, and it would be 21 years before they again arrived at a loss of 12½ per cent. At first the loss would be reduced to about 4½ per cent., but it would gradually increase. There would be considerable capital saving, and there would be a further advantage to the company, that it would not have to generate that 12½ per cent. of current which was lost in transmission. The consumers had benefited by a reduction in price of 8 per cent., and they had given them new lamps for old. He did not think that since 1897 there had been any electric undertaking of any importance in which lamps of a less voltage than 200 had been used. He did not think that there was any greater

eating away of the insulated material in a 200 power voltage than there was in the case of a lower power voltage, provided that proper material was put in.

Mr. W. A. Chamen, the city electrical engineer of Glasgow, gave evidence to the effect that his system had changed pressure from 100 volts to 150, 200 and 250 volts and only half a dozen consumers raised any objection.

Electrical Engineers and Mathematics.

Prof. John Perry, in his presidential address to the Institution last November, struck the keynote for many a subsequent lecturer on electrical engineering. His emphatic call for more modern and suitable methods of teaching mathematics in technical colleges, methods calculated to give the young electrical engineer a greater liking for mathematical calculation, has just been further endorsed by Prof. Lodge in his presidential address to the new Birmingham section of the Institution of Electrical Engineers. At the Manchester section a very similar attitude was assumed by Dr. Nicolson in a paper on the "Training of Electrical Engineers." Let us hope that these excellent orations will bear good fruit.

"Insulation on Cables."

A paper with this title came before the London body of the Institution of Electrical Engineers on March 7, the author being Mr. Mervyn O'Gorman. A reprint of the paper would fill something like fifty columns of *ELECTRICITY*. The title of the paper allowed of the inclusion of a great number of topics. The proofs were circulated among some of the members a couple of days before the meeting, but it would be a good day's occupation to read the paper so as to be prepared to join in the discussion, and most electrical engineers are too busily engaged at present for that. The paper consisted of over 100 numbered paragraphs and various appendices.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended March 13:

Antwerp, 14 packages, \$840; Argentine Republic, 165 cases, \$4,535; 33 packages, \$3,516; Australia, 33 cases, \$3,390; Barcelona, 5 packages, \$160; Berlin, 20 packages, \$622; Bordeaux, 80 cases, \$4,000; Brazil, 12 packages, \$1,365; Bristol, 236 packages, \$29,063; British East Indies, 7 packages, \$180; 8 cases, \$900; British Guiana, 28 cases, \$399; British Possessions in Africa, 86 packages, \$14,960; British West Indies, 44 packages, \$458; 2 cases cables, \$163; Chili, 4 packages, \$90; China, 3 cases, \$58; Cuba, 8 cases, \$1,026; 144 packages, \$2,803; 6 packages telephone supplies, \$1,246; Genoa, 126 packages, \$272; Gibraltar, 8 packages, \$776; Glasgow, 103 reels electric cable, \$28,294; 28 packages, \$2,729; Hamburg, 7 packages, \$1,074. Havre, 37 packages, \$2,342; Hong Kong, 82 packages, \$2,567; 1 case, \$195; Japan, 52 cases, \$7,061; 148 packages, \$15,946; Liverpool, 420 packages, \$44,448; 3 packages motor carriage material, \$287; London, 297 packages, \$30,380; 146 cases, \$11,817; 1 case cables, \$100; 18 packages motor vehicles and parts, \$8,750; Manchester, 11 packages, \$2,420; 3 cases, \$356; Naples, 1 box, \$60; New Zealand, 7 cases, \$315; Patros, 12 cases, \$740; Peru, 3 cases, \$70; Rotterdam, 2 packages, \$183; Sheffield, 5 cases, \$150; Southampton, 68 packages, \$1,900; 1 case, \$53; U. S. Colombia, 51 cases, \$980; Venezuela, 1 package, \$17.

PERSONAL MENTION.

Mr. Gilbert Wilkes, president of Gilbert Wilkes & Co., electrical engineers of Detroit and Denver, died in Denver March 10 from a hemorrhage of the lungs.

Mr. W. Frank Gitchell has accepted a position tendered him as controller of the British Columbia Electric Railway Company, with headquarters at Vancouver, B. C.

INCORPORATIONS.

The Southern Telegraph Company, Trenton, N. J. Capital stock, \$125,000.

The Caro & Lake Huron Electric Company, Caro, Mich. Capital stock, \$200,000.

The Acme Fuse Company of Baltimore, Dover, Del.—to deal in electrical appliances. Capital stock, \$100,000.

The Lyons Electric Railway Company, Lyons, N. Y. Capital stock, \$45,000. Directors: C. A. Lux, D. E. Lux and C. F. Lux, Clyde.

The Big Fork Electric Power & Light Company, Kalispel, Mont. Capital stock, \$100,000. Incorporators: C. E. Conrad, L. Tinkle and K. W. Tinkle.

The Lux Electric Light, Heat & Power Company, Clyde, N. Y. Capital stock, \$50,000. Directors: Charles A. Lux, D. E. Lux and C. F. Lux, Clyde.

The Ravens Electric Company, Coeymans, N. Y. Capital stock, \$19,000. Directors: Aldine Nodine and S. W. Mosher, Coeymans, and Nathaniel Niles, Albany.

The Warrenton Electric Company, Warrenton, Va. Capital stock, \$15,000. Incorporators: George B. Stone, president; Gen. Eppa Hunton, vice-president; F. D. Gaskins, secretary and treasurer.

The Gloversville Citizens' Electric Company, Gloversville, N. Y.—to supply electricity to Gloversville, Johnstown, Northville and Broad Albin. Capital stock, \$40,000. Directors: John Begley, F. S. Sexton and Ervin Klein, Gloversville.

The New Idea Attraction Company, Elizabeth, N. J.—to deal in ornaments, stationery, pictures, art treasures and electrical devices. Capital stock, \$30,000. Incorporators: James V. Freeman of Woodbridge, Lydia A. Pitt and Frank D. Higbee of New York City.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 12, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

669,850. System of Electric Propulsion. Richard B. Pailton, Williamsport, Pa. Filed April 11, 1899. Renewed Dec. 20, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

669,546. Portable Electric Lamp. Morris Newgold, New York City. Filed March 8, 1900.

669,590. Electric Lamp. Marshall W. Hanks, Pittsburg, Pa., assignor to George Westinghouse, same place. Filed June 7, 1900.

669,594. Magazine Ballast for Electric Lamps. Henry N. Potter, Pittsburg, Pa., assignor to George Westinghouse, same place. Filed June 4, 1900.

669,610. Making Glowlers for Electric Lamps. Alexander J. Wurts and Marshall W. Hanks, Pittsburg, Pa., assignors to George Westinghouse, same place. Filed June 7, 1900.

669,613. Dynamo Electric Machine or Electric Motor. Norman C. Bassett, Lynn, Mass., assignor to the General Electric Company of New York. Filed Jan. 18, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

669,538. Electric Switch. Thomas G. Meinema, Morton Park, Ill., assignor to Edward W. Hammer, Chicago, Ill. Filed March 1, 1900.

669,573. Dynamo-Electric Machine. Amos R. Bliss, Lowell, Mass., assignor to the New England Motor Company of Massachusetts. Filed June 25, 1900.

669,574-669,575. Dynamo-Electric Machine. Donald M. Bliss, Lowell, Mass., assignor to the New England Motor Company of Massachusetts. Filed Feb. 19, 1900, July 9, 1900.

669,595. Electrical Controller. Charles R. Reynolds, Hartford, Conn., assignor to Henry J. Cogswell and Halsey B. Philbrick, same place. Filed March 2, 1900.

669,662. Multiphase Transformer. Edwin W. Rice, Jr., Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Dec. 14, 1898.

669,670. Electrical Measuring Instrument. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed June 25, 1900.

669,706. Electric Switch. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, New York City. Filed Nov. 20, 1899.

669,759. Electric Motor. Charles Milde, Paris, France, as-

signor to Ste. Ch. Milde Fils et Cie., same place. Filed Aug. 22, 1900.

669,802. Electrical Device for Converting Alternating Currents. Albert Nodon, Paris, France. Filed Sept. 6, 1900.

669,803. Dynamo. Charles A. Parsons and George G. Stoney, Newcastle-upon-Tyne, England. Filed Dec. 15, 1900.

669,823. Electric-Lamp Controller and Rheostat. Andrew H. Dreijer, Brooklyn, N. Y. Filed April 23, 1900.

669,940. Rectifier for Electric Currents. Franklin M. Gilbert, St. Paul, Minn., and George K. Wheeler, Topeka, Kan., assignors to the Electric Axle Light & Power Company, New York City. Filed Dec. 17, 1898.

669,941. Electric Switch. Franklin M. Gilbert, St. Paul, Minn., and George K. Wheeler, Topeka, Kan., assignors to the Electric Axle Light & Power Company, New York City. Filed Dec. 17, 1898.

TELEPHONES AND TELEPHONE APPARATUS.

669,501. Supervisory Signal Apparatus for Telephone-Switchboards. Oro A. Bell, New York City, assignor to the Western Electric Company, Chicago, Ill. Filed July 31, 1899.

669,544. Apparatus for Party Telephone-Lines. Frank R. McBerty, Downer's Grove, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed May 21, 1898.

668,545. Apparatus and Circuit for Telephone-Switchboards. Frank R. McBerty, Evanston, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed June 12, 1899.

669,707. Telephone-Exchange System. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 12, 1894.

669,708. Apparatus for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Feb. 28, 1895.

669,709. Supervisory Signal for Telephone Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 23, 1895.

669,710. Telephone-Circuit. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 18, 1897. Renewed Sept. 4, 1900.

669,792. Combined Telephone and Alarm System. Angus S. Hibbard, Chicago, Ill. Filed July 7, 1900.

669,800. Telephone-Receiver Holder. George S. Meyer, Newburg, N. Y. Filed Dec. 8, 1900.

669,832. Combined Telephone and Fire-Alarm Apparatus. Angus S. Hibbard, Chicago, Ill. Filed July 7, 1900.

669,875. Coin-Controlled Telephone. Julio E. Cordovez, Panama, Colombia. Filed Aug. 16, 1900.

669,900. Telephone Service-Meter and Circuit. David S. Hulfish, Chicago, Ill., assignor to the American Bell Telephone Company, Boston, Mass. Filed Dec. 18, 1900.

669,901. System of Central Current-Supply for Private-Line Telephone-Circuits. Malcolm C. Rorty, Dedham, Mass., assignor to the American Bell Telephone Company, Boston, Mass. Filed Oct. 4, 1900.

669,944. Telephone. Albion P. Merrill and Jenny W. Hays, San Francisco, Cal. Filed Jan. 10, 1900.

MISCELLANEOUS.

669,517. Binding-Post for Electrical Connections. Alexander Fischer, New York City. Filed Feb. 19, 1900.

669,543. Electric Gas-Igniter. Oscar von Morstein, Berlin, Germany. Filed Dec. 8, 1896.

669,556. Electrical Pliers. Francis L. Spring, Townsend, Mass. Filed June 13, 1900.

669,577. Casing for Electric Motors. Charles A. Eck, Newark, N. J. Filed Oct. 30, 1900.

669,619. Device for Adjusting Electric Appliances to the Human Body. James Charles, Richmond, Ind. Filed Jan. 14, 1901.

669,640. Electrically-Operated Pump. Edward M. Hewlett, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Dec. 4, 1899.

669,644. Signal or Alarm. Paul M. Jerrard, Johannesburg, South African Republic. Filed Oct. 5, 1900.

669,691. Insulator for Electric Wires. Morton Harloe, Hawley, Pa., assignor of one-half to Wilton S. Bloes, Peckville, Pa. Filed Sept. 19, 1900.

669,732. Electrolytic Apparatus. Paul W. Knauf, Philadelphia, Pa., assignor to the Electrical Lead Reduction Company, same place. Filed July 17, 1900.

669,834. Primary Battery. Charles A. Hussey, New York City. Filed July 24, 1900.

669,926. Process of Electrolytical Extraction of Metals. Carl Hoefpner, Frankfurt-on-the-Main, Germany. Filed Sept. 27, 1899.

669,942. System for Generating and Distributing Electric Currents. Franklin M. Gilbert, St. Paul, Minn., and George K. Wheeler, Topeka, Kan., assignors to the Electric Axle Light & Power Company, New York City. Filed Dec. 17, 1898.

669,968. Induction Coil. Leonidas G. Woolley, Kenton, O. Filed July 18, 1900.

DESIGN.

34,211. Insulating Support for Electrical Conductors. Lewis B. Stillwell, Niagara Falls, N. Y. Filed Dec. 18, 1900. Term of patent 14 years.

THE TELEPHONE WORLD.

Chicago to Have New 'Phone Company.

An ordinance was recommended to the council last week granting a franchise to the United Telegraph, Telephone & Electric Company of Hyde Park, which will be under contract to furnish service at a little more than half the rates of the Chicago Telephone Company.

The measure was previously passed by the committee on gas, oil and electric light.

The Cairo, Ill., Telephone Company has sold its telephone system to Messrs. John S. Alsthorpe and Marion C. Wright. The Cairo Telephone Company was organized about five years ago by Messrs. Thomas W. Gannon and Angus Leek. Besides the local exchange it owned lines to Mound City, Villa Ridge and Vienna, and also in Southeast Missouri and Western Kentucky. The new owners will take charge on April 1, and it is understood that they will continue it as an independent system and will immediately begin work on proposed improvements.

A company has been formed to build a telephone exchange in Polo, Mo. The officers of the company are F. M. Kern, president; M. H. Winger, secretary and treasurer; J. W. Houston, J. D. Vanolinda, C. C. Hopkins, J. B. Bathgate and T. J. Campbell, directors. A farmers' telephone company has also been organized to connect Polo with Lathrop, Mirabile and Kingston, Mo.

All of the cars of the new Toledo, Fostoria & Findlay, O., Electric Railway Company will be equipped with telephones, an innovation which will be a great convenience to patrons. The instruments will be regulation affairs, and connection will be made with the telephone wire strung along the right of way by means of a jointed rod. The line will be a private one and constructed of copper wire.

The directors of the Providence, R. I., Telephone Company have voted to increase the capital stock of the company to \$1,600,000 by the issue of new stock to the amount of \$400,000, the stock to be offered at par (\$50 a share) to stockholders of record March 20, 1901, in proportion of one share of new stock for every three held on the date mentioned.

The United Telephone & Telegraph Company of Philadelphia has absorbed the local Independent Telephone Company of Lebanon, Pa., the deeds having been recorded. The consideration mentioned in the deed is \$75,000.

There is a rumor that a Ludlow, Ky., company will organize with a capital of \$15,000, with the intention of purchasing the telephone system owned by the Kentucky Electric Company. Connection will be made with the telephone system in Cincinnati, O.

The farmers south of Humboldt, Neb., have started an independent telephone line for their own convenience and have selected committees to push the work among their neighbors. The line if completed will be connected with the independent system of Humboldt.

Fitchburg and Leominster, Mass., capitalists have asked for a franchise for the Fitchburg & Leominster Telephone Company, which proposes to compete with the Bell interests. State Senator Blodgett is among those interested in the new company.

A telephone line is to be built from Darien to Bennington, N. Y., the coming season. This will relieve the latter town of the distinction of being the only town in Wyoming County without telephone service.

The Harriman, Tenn., city council recently granted a franchise to the Citizens' Mutual Telephone Company for a term of ten years. It is expected that the new company will begin the erection of its plant soon.

The Bedford, Ind., city council has granted franchises to three new telephone companies, the Hoosier Telephone Company being the largest. Exchanges will be put in and war will be made against the Central Union Company.

The Southern States Telephone Company is having a new cable laid between Norfolk and Berkeley, Va. This cable is much larger than the one formerly used, and it is hoped that the new one will give better service.

Mayor Leader, of Reading, Pa., lately signed the ordinance granting street rights to the Schuylkill Valley Telephone Company, which promises to give good service at a greatly reduced figure.

A telephone line 18 miles long has been completed to Minkka, Fla., and has been pronounced the best in Manatee County.

Reorganization of the Telephone, Telegraph & Cable Company.

Independent telephone interests in New York City and Boston were recently surprised to hear, says the N. Y. "Commercial," that William J. Latta, the president of the Telephone, Telegraph & Cable Company of America, has resigned, and that the management had determined upon radical changes in the policy of that company.

One of the most important of these is that an immense scaling in capitalization has been decided upon and a more conservative attitude in the development of the independent telephone industry of the country will be adopted by the board of directors.

In the official announcement made March 14, the statement was made that the capital stock will be reduced from \$30,000,000 to \$9,000,000, and the par value of the shares will be \$15 instead of \$50. By the reduction the assessable feature of the stock will be fully terminated to that amount. The shares will thus be full paid, the circular states, and will be unassessable thereafter.

Not the least important part of the circular is the statement that the office of president of the Telephone, Telegraph & Cable Company of America has been left vacant for the present.

In the interim Henry R. Wilson, one of the directors and vice-presidents, is acting in the place vacated by Mr. Latta. It is understood that Mr. Latta resigned owing to dissatisfaction expressed over the condition of the company, and it is said that the office will not be filled until a thoroughly capable independent telephone man has been found who will carry on the fight against the Bell.

Mr. Latta is still a member of the board of directors, and has been chosen to fill his old place as a member of the executive committee.

The independent telephone movement will be carried on and extensive plans are now being prepared which will be laid before the stockholders in a short time. In the meantime the directors call attention to the fact that a number of assessments have not been paid, and the hope is expressed that all delinquent stockholders will meet their obligations without further action by the directors.

The Butler Western Telephone Company of Hamilton, O., has made application to the county commissioners for a supplemental franchise on the river road to Venice. The original intention of the telephone promoters to run over the New London and Colerain, Oxford and Brookville turnpikes, to Hamilton and Venice will be altered accordingly. It is claimed that an independent telephone company will shortly apply to the county commissioners for a franchise to connect Oxford, Mixerville, Springfield and Brookville with a line over the Oxford, Mixerville and Brookville turnpike.

Arrangements have been made between the La Crosse, Wis., Telephone Company, an independent company, and all independent lines between La Crosse and Milwaukee, whereby connections can be made for long-distance service. It is proposed to build a line from La Crosse east as soon as frost leaves the ground. The line will be built by way of Sparta, Baraboo and Madison, and will consist of a solid copper wire.

A new telephone line is being erected between Branch via Lucas and Grove, to McKinney, Tenn., which now leads all others in the State in point of density of rural population, and is threaded by a perfect network of telephones, extending to all of its many rural postoffices and villages. Most of these telephone systems are owned and operated by citizens of the places mostly benefited.

The Cumberland Telephone & Telegraph Company is negotiating for the purchase of the line owned and operated by the Ducktown, Tenn., Telephone Company, and should it make the purchase, it will put in a local exchange and extend its line from Benton to Ducktown by way of Parksville and Ocoee River and will give the people of Ducktown long-distance service, which is badly needed.

The new telephone company in New Berlin, N. Y., has its line nearly completed. All of the business places and a large number of residences have been wired and the success of the project is practically assured.

Street telephones similar to fire alarm boxes are to be placed at the street corners in New Haven, Conn. A nickel opens the wire for talk.

The Citizens' Telephone Exchange of Lawrenceburg, Tenn., will shortly be extended to Pulaski in that State.

The Cumberland Telephone Company will make extensive improvements in Greene County, Tenn.

Additional Telephone Lines.

The general deficiency bill, which passed at the recent session of Congress, provided the sum of \$1,478.18 for the general expenses of the District electrical department and the telephone and telegraph service. This amount included an item for the establishment of five additional trunk lines between the telephone switchboard at headquarters and the exchange of the Chesapeake & Potomac Telephone Company, and the Commissioners have directed the electrical engineer to have these additional trunk lines installed, there being urgent need of them.

Telephonic connections complete, far-reaching and cheap, not only between the large cities, but also between every village and hamlet in Erie County and Western New York are the considerations promised by the National Telephone Association in return for the right to establish a competing telephone system in Buffalo and vicinity. The association is a combination of independent telephone companies. Among the cities in which the local companies have membership in the National Association are St. Louis, Chicago, Pittsburg and Indianapolis. The Queen City Telephone Company is also in the association, and when its lines are set up, it will be connected with Tonawanda, Niagara Falls, Syracuse, Rochester and other cities. More than this, it will also bring into the National Association many of the smaller towns which have their own local company.

Richard Hankins, of the Overton Telephone Company, has lately been in Cookeville, Tenn., for the purpose of interesting local parties in his company. A meeting was held at which Mr. Hankins stated that if the citizens of Putnam County would subscribe to the capital stock of his company it would build its lines to Cookeville and place an exchange in that city. A committee was appointed to draw up a contract, formulate a schedule of rates and ascertain how many 'phones would be subscribed for in Cookeville. This company has a line from Algood to Byrdstown, Tenn., with some short lines reaching into the surrounding territory.

The switchboard of the Olneyville, R. I., telephone exchange that is about completed is designed for a thousand lines. The board is equipped with a system of self-restoring noiseless drops. In the new board the drop will automatically be restored to its place by the action of the operator inserting the plug to ascertain the desire of the subscriber, and to make the desired connection. In conjunction with the opening of the new exchange, all overhead telephone wires in Olneyville Square will be dispensed with. Already all the lines to be connected with the new exchange are placed in conduits underground and they enter the exchange in four cables, each provided with 240 pairs of wires.

A recent rain and thunder storm in Texarkana, Ark., carried destruction in its wake. Every telephone line entering that place was prostrated and the Postal and Western Union Telegraph Companies lost all of their wires with the exception of two or three lines in their Western outlets.

The new telephone exchange for Tuscumbia, Ala., has been completed and is now in thorough working order.

The telephone line between Glenmore and Taberg, N. Y., was completed recently.

TELEPHONE INCORPORATIONS.

The Gardner Telephone Company, Gardner, Kan. Capital stock, \$5,000.

The Citizens' Telephone Company, Bath, N. Y. Capital stock, \$10,000. Directors: B. G. Hubbell, C. E. Stowe and J. H. Fuller, Cleveland, O.

The Pittsboro Telephone Company, Pittsboro, Ind. Capital stock, \$3,000. Directors: Charles R. Sowden, W. D. Lewis and Samuel James.

The Farmers' Telephone Company of Harrison County, Bethany, Mo. Capital stock, \$2,500. Incorporators: C. H. Neil, W. H. Springer, R. J. Goodrich and others.

The Independent Telephone Company, Chicago. Capital stock, \$3,000. Incorporators: Arthur W. Underwood, I. F. Dunwiddle and J. J. Comer.

The Cambridge Mutual Telephone Company, Cambridge, Ill. Capital stock, \$2,500. Incorporators: Theodore Boltensstein, Ernestine Boltensstein and Victor Boltensstein.

The Columbus Junction Telephone Company, Columbus Junction, Ia. Capital stock \$8,000. Incorporators: N. F. Hendrix, F. M. Molsberry, A. S. Thompson and A. C. Kelly.

GENERAL ELECTRICAL NEWS.

Lighting.

Alto Pass Ill.—This town is to have electric lights for the streets in the near future.

Aneta, N. D.—The citizens of this place are agitating the question of erecting an electric light plant.

Armada, Mich.—The citizens of this place are agitating the question of erecting an electric light system.

Ashland, Wis.—The Chicago & Northwestern is figuring on putting in an electric lighting plant here to furnish light for the company's dock and railroad yards.

Bristol, Tenn.—The Legislature will be petitioned for authority to issue \$25,000 bonds for erecting an electric light plant here.

Bluffton, Ind.—Ober & Mann contemplate erecting an incandescent lighting plant in this place providing the council will give them a franchise.

Charleston, S. C.—St. J. A. Lawton, 43 South Bay street, this city, wants bids on an electric light plant, etc., for a hotel.

Clarence, Mo.—This city will hold an election to decide the issuance of bonds for an electric light plant.

Cloverport, Ky.—J. Hook of this place contemplates the erection of an electric light plant.

Des Moines, Ia.—The Dewitt Electric Light & Power Company has increased its capital stock from \$3,000 to \$9,000.

Eden Valley, Minn.—This village will in the spring erect an electric light plant.

Elkhart, Ind.—Leading business men and capitalists of this city will organize a new electric light company and a petition for a franchise will soon be presented to the city council.

Greenwood, Ind.—A water and electric light franchise was lately granted to L. K. Davis, consulting engineer of the water company of this city.

Iron River, Mich.—The project of a municipal electric lighting plant is being discussed here.

Jersey Shore, Pa.—It is stated that the Jersey Shore electric lighting plant is to be sold.

Kendallville, Ind.—This town is preparing to erect an electric light plant.

Kenosha, Wis.—A number of Chicago and Kenosha capitalists are making an effort to organize a new electric light and power company here. W. L. Russell of Chicago is at the head of the enterprise.

Manton, Mich.—Bonds will be issued here for the establishment of an electric light plant.

Midlothian, Tex.—Negotiations are pending for the establishment of an electric light plant here.

Mineral Ridge, O.—The city council is considering the question of having electric street lights.

New Ulm, Minn.—At the coming municipal election the question of issuing \$30,000 in bonds will be voted on for building an electric light plant.

Peoria, Ill.—A special meeting of supervisors will be held March 27 for the purpose of discussing the matter of installing an electric light plant at the courthouse and jail in this city.

Sheffield, Mass.—An electric light plant is being talked of for this place.

Shoshone, Idaho.—I. B. Perrine is at the head of a project to establish an electric light plant to cost \$30,000. The plant will be located at Blue Lakes and will furnish electric light and heat for this place.

St. Joseph, Mich.—A short time ago the question of municipal ownership of an electric light plant in this city was decided and the city proposes to erect an electric light plant costing about \$12,000.

Summitville, Ind.—An electric light company was recently formed here and has been granted a franchise for lighting the town. W. F. Custer is president of the company.

Tabor, Ia.—An election will be held March 25 to vote on the question of granting a franchise to the Tabor Water & Light Company for the erection of an electric light plant.

Two Rivers, Wis.—It was voted at a recent election to bond the city for \$20,000 to pay one-third of the cost of the electric light and waterworks plant. The system will be completed by September 1.

Utica, Ill.—H. B. Grove of Little Rock, Ark., is trying to get a franchise for the erection of an electric light plant for this place.

Waterloo, Neb.—The citizens of this place are considering the question of erecting an electric light plant.

West Chester, Pa.—Preparations are being made to enlarge the electric light plant here.

Winfield, Kan.—An election will be held to vote on the question of issuing bonds for the purpose of erecting an electric light plant.

Street Railways.

Atlanta, Ga.—The Atlanta Rapid Transit Company has secured a franchise from the city authorities to build its proposed line in this city.

Bakersfield, Cal.—A franchise has been granted to the Mountain Valley & Bakersfield Railway Company to construct an electric car line from this city to the Kern River oil fields. The work of construction will be commenced within three months.

Bryan, O.—At the city council meeting last week a franchise was granted to W. D. Sherwood as trustee of the Northern Ohio Electric Railway Company for the construction of a trolley line from Defiance, to be completed within 18 months.

Canaan, Conn.—A company is being organized for the construction of an electric road from the Massachusetts State line north of here to Bridgeport, a distance of 70 miles. The plan is to have this road connect with the proposed Berkshire line from the State boundary to Pittsfield, Mass., and with its connections form a continuous line to New York City.

Cape May, N. J.—A syndicate of New York, Philadelphia and Baltimore men, at the head of which is A. B. Wilgus, Jr., of New York, last week purchased the beach front trolley road of the Cape May, Delaware Bay and Sewell's Point Railroad Company for \$90,000.

Cleveland, O.—The Cleveland Southern Electric Railroad, to run from this city to Wooster via Cleveland and Berea, has been organized and the road is expected to be in operation during the summer. Cleveland capitalists are behind the road. The officers are W. H. Lamprecht, president; A. H. Pomeroy, vice-president; F. H. Fuller, secretary, and F. T. Pomeroy, treasurer. The capitalization is \$1,000,000.

Elmira, N. Y.—There is some talk of a trolley line connecting Elmira and Binghamton by way of Sayre, Waverly and Athens.

Galena, Kan.—N. F. Moore has been granted an electric railway franchise. The line will be owned by Pennsylvania capitalists. It is the intention of the company to form a belt of the line, taking in the lead and zinc coal fields of this section. It is understood that the line will extend through Webb City, Joplin, Galena, Baxter, Columbus and Pittsburg.

Lexington, Ky.—An electric road from here to North Middletown suggested.

Louisville, Ky.—The proposed New Albany, Jeffersonville and Sellersburg electric line to connect the latter town with the two cities as well as Louisville seems to be a certainty.

Manheim, Pa.—The Strasburg and the Manheim electric road will be built next summer.

Ravenna, O.—The county commissioners have granted the Northern Ohio Traction Company a franchise for an electric railway between this place and Kent via Lake Brady.

Red Bud, Ill.—The Belleville Traction Company has decided to build an electric line through several nearby cities, the terminus to be at this place.

Richmond, Ind.—Messrs. McDonald & Cross are the promoters of an electric line from Dayton, O., to this city.

Scotia, N. Y.—The Scotia Traction Company has been organized to operate an electric street railroad from a point on the Fitchburg Railroad in this place to Schenectady with a capital of \$30,000. G. W. Lynch and William H. Delauey, New York City, H. V. Mynderse, Schenectady, are the directors.

Manufacturing.

Chicago.—The Benton & Walker Manufacturing Company, with a capital of \$2,500, will manufacture mechanical and electrical goods. Frank J. Walker, George A. Benton and Davis F. Matchett are at the head of the concern.—The International Specialty Company of this city, capitalized at \$2,500, is manufacturing electrical specialties. Samuel W. Norton, Samuel J. Lumbard and James O. Broder hold an interest in the firm.—The Federal Electric Company has been formed for the purpose of manufacturing electrical devices with a capital of \$2,500. Henry M. Bates, Evans Holbrook and Edward Frey are the promoters.

Cleveland, O.—The Sterling Electrical Manufacturing Company of this city has lately been organized with a capital of \$45,000.

Danbury, Conn.—M. Burton Rogers of this place has purchased controlling interest in the Russell-Tomlinson Company of Milford, manufacturers of electrical appliances. It is said that the company will remove its works to Danbury.

Detroit, Mich.—A short time ago the Capital Electric Manufacturing Company filed articles of incorporation with the county clerk, and will manufacture electrical devices and appliances in this city upon a capital stock of \$30,000. Arthur L. Bresler, T. George Rakestraw, William T. Bowen and Eugene A. Bresler are the stockholders.

Manchester, Va.—In the new factory of Willis & Scott in this city will be manufactured all kinds of electrical appliances and machinery. It will give employment to between 500 and 600 skilled operatives.

New York City.—The Magneto Electric Company has been formed to manufacture and acquire electric rights with a capital of \$1,000,000. Louis E. Niles of Springfield, O.; William S. Van Brocklyn, of Amsterdam, N. Y., and William P. Rower, of Troy, N. Y., are interested in the concern.—L. E. Safford, Joseph G. Quinn and Eugene Berry, all of this city, hold an interest in the Safford Electric Manufacturing Company, capitalized at \$250,000, to manufacture electric appliances, apparatus, etc.

Niles, O.—A company composed of Niles capitalists has been formed to manufacture electric lamps and transformers.

South Norwalk, Conn.—It is probable that electric signals will be turned out at the plant that the new firm of Thompson, McKibbin & Co., intend to establish in this place.

Syracuse, N. Y.—A new manufacturing concern, capitalized at \$100,000, and known as the Milloy Automatic Trolley Catcher Company, is located here. J. P. Devine is president, P. D. Milloy vice-president and general manager, William S. Farmer treasurer, and Mr. Tanner secretary.

Company Matters.

Indianapolis, Ind.—The Commercial Electric Company, located in this city, with a capital stock of \$33,700, is licensed to transact business in Illinois with a State capital of \$2,500.

Le Roy, N. Y.—The Le Roy Hydraulic Electric Company is now contemplating the enlargement of its plant. This will probably be done during the coming summer, in which case larger dynamos will be put in for furnishing power for manufacturing purposes and all other requirements.

Automobiles.

Richmond, Va.—An automobile factory will probably be located here. R. W. Coffee is interested in the movement.

Waltham, Me.—The Waltham Automobile Company has been incorporated under the laws of Maine with a capital of \$50,000. The officers are W. L. Carney, president, and Jacob Merrill, treasurer.

Weyauwega, Wis.—The first appearance of an automobile was made on the streets of this city a short time ago.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16½c.; Lake, 16½@17c.; casting, 16½@16½c.

The Providence, R. I., Telephone Company has increased its capital stock from \$1,600,000 to \$2,000,000.

The Twin City Rapid Transit Company has settled its litigation with the State of Minnesota over its license fees.

Business failures in the United States last week numbered 209, against 198 the same week last year; in Canada there were 33, against 23 last year.

The United Traction & Electric Company of New Jersey has declared a dividend of 1 per cent. payable April 1. Books closed March 19 and reopen April 2.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 5½@5½; Electric Boat, 24@26; Electric Vehicle, 15@15½.

The N. Y. State Board of Railroad Commissioners gave a hearing March 13, on the application of the Buffalo, Niagara Falls & Rochester Railroad Company, for permission to begin an electric road connecting the cities named.

According to the Boston "News Bureau" the president of a large independent telephone company, located in the West, says that since the Berliner decision he has been able to sell bonds to the par value of \$1,500,000 for construction purposes.

Steps are being taken to secure a New York market for the securities of the Massachusetts Electric Railway Company, which controls the street railway lines in Massachusetts north and south of Boston and a few others extending into New Hampshire and Rhode Island. At present these securities are only on the Boston market.

At a cost of nearly a quarter of a million dollars, the Royal Electric Company of Montreal has purchased land to erect buildings which will enable the company to about triple its present production. The electrical power is to be developed to 30,000 horse power, of which the Montreal Street Railway will take 10,000, and for lighting 20,000 horse power. The capacity of the existing works is only about 10,000.

The directors of the Westinghouse Electric and Manufacturing Company, at their meeting on March 14, voted to issue \$3,000,000, par value, of the recently authorized increase of capital stock, the price, terms and conditions of the issue to be upon the recommendation of a special committee, determined at the regular board meeting to be held on March 27. The directors also declared the regular quarterly dividend of 1½ per cent. on the preferred stock, payable April 1. Books close March 23 and reopen April 2.

The New York & New Jersey Telephone Company offers stockholders \$1,875,000 of new stock at par on the basis of one share of new stock for each four shares held. Right to subscribe expires April 15. Payment for new stock will be 50 per cent. April 15, 25 per cent. August 1, and 25 per cent. November 1, or subscribers may pay for the entire amount April 15 at \$101 per share. None of the above stock will participate in the dividend payable April 15.

At a meeting of the directors of the Seattle Electric Company, held on March 13 in Boston, the first regular quarterly dividend of 1½ per cent. on the preferred stock was declared payable April 1 to stockholders of record, March 15. Transfer books closed March 15 and open April 2. The Seattle Electric Company was organized in January, 1900, by Messrs. Stone & Webster of Boston to take over and operate the properties of nine railroads and three light companies in the city of Seattle. Its capital stock consists of \$5,000,000 of the common stock, \$1,250,000 of preferred—all of which will be issued.

A special meeting of the stockholders of the Telephone, Telegraph & Cable Company of America will be held at the office of the company, No. 55 Montgomery street, Jersey City, N. J., on March 26, at 12 o'clock. The advisability of reducing the capital stock from \$30,000,000 to \$9,000,000 by reducing the par value of the shares from \$50 to \$15 will be considered. The proposed action by the company in reducing its capital stock to \$9,000,000 by reducing the par value to \$15 eliminates the assessment feature and leaves the company with a fully paid up capital of \$9,000,000.

Vice-President Clark, of the Western Union Telegraph Company, was the witness before the Industrial Commission in Washington last week. He argued against Government ownership of the telegraph companies. There are in the United States 1,118,086 miles of wire to 1,585,267 in all Europe. The population per mile of telegraph wire in the United States is 67 to 130 in Great Britain, 220 in Switzerland and 321 in Belgium. There are 29,000 telegraph offices in the United States to 10,816 in Great Britain. The capitalization of the Western Union Telegraph Company is \$41 per mile of wire. The capitalization in Great Britain is about twice as much. The Government of Great Britain has lost about \$22,000,000 from its ownership of telegraph lines.

Baring, Magoun & Co., offers \$2,000,000 Commercial Cable Company 4 per cent. mortgage bonds at 101 and interest. The proceeds of this issue are to be used to extend the land line, as the mortgage covers the Cable Company's property as well as the entire property of the Postal Telegraph Company. The net earnings of the company for 1900 were \$2,679,666, while the interest charge is only \$800,000. Besides which the company holds a reserve fund of nearly \$4,500,000 invested in United States Government and first-class American railway bonds. One very unique feature of these bonds is that they are exchangeable into sterling debenture stock with the same security at about 1½ per cent. under the par of exchange, thus making it a continuous call on sterling at a very attractive rate.

EDITORIAL NOTES.

Marconi Wins His Suit.

In the issue of *ELECTRICITY* of October 11, 1899, under the title of "Who First Discovered Wireless Telegraphy?" we referred at considerable length to the fact that Prof. Dolbear proposed to bring a suit for infringement and damages against Marconi. This suit has been tried and the United States Circuit Court of New York on Friday last handed down a decision in favor of the Italian inventor. The suit was brought by Lyman C. Learned of Boston.

Mr. Learned sued as the assignee of Prof. Dolbear for damages to the amount of \$100,000, and the issue of an injunction restraining Marconi from using apparatus for wireless telegraphy, said apparatus being alleged by the plaintiff to be covered by patents issued to Dolbear.

The original complaint in the case set forth that Dolbear was the original inventor of the system, that his patents were issued in December, 1882, and October, 1886, and assigned to Learned in July, 1899. The complaint further stated that the apparatus for wireless telegraphy exhibited in the diagrams of Marconi's patents was impractical, and that the defendant well knew this. It had, the complainant alleges, only commercial value when one terminal grounded was used for transmission and one for receiving, and hence that contracts entered into by the defendant for commercial purposes were carried out by recourse to the plaintiff's patented instruments, or instruments similar. Therefore, application was made for the injunction and demand was made that Marconi be directed to pay over profits to the plaintiff. Marconi applied similar criticism to the apparatus of Dolbear. It was useless, and not adapted for any commercial purposes, his defence alleged. For the rest, he set up a general denial that his wireless telegraphy apparatus or any part of it was an infringement of the plaintiff's.

During the course of the litigation, D. J. A. Fleming, a professor of electrical engineering in University College, London, England, and Prof. Charles R. Cross Thayer, professor of physics in the Massachusetts Institute of Technology, testified as experts. The contentions of the plaintiff were held not to be sustained.

The Metric System.

It is to be regretted that Congress failed to pass House bill 5,768 to adopt the weights and measures of the metric system as the standard weights and measures in the United States. For several consecutive Congresses preceding the last one bills have been introduced looking to the adoption of the metric system, and in each Congress the proposition has received the favorable consideration of the Committee on Coinage, Weights and Measures. The obvious advantages of the system as compared with the system or systems now in use have impressed all who have given the subject serious consideration. Voluminous reports have been made from time to time, clearly setting forth the disadvantages of the highly complex systems of weights and measures now in use in the United States and the greatly superior facilities offered by the metric system.

One of the most important reasons for its adoption by the United States is that it is the international system of weights and measures. Its recent adoption by the Russian Government leaves, practically, among the civilized nations of the world, only the United States and Great Britain not using it. As these nations use measures essentially the same, it may be said that they are now backing the foot and the pound against the meter and kilogram supported by all the rest of the world. It is time that they were justified in considering themselves the two greatest nations of the world, and in trade and commerce they are not surpassed. But it must not be forgotten that their desire is to establish and maintain trade with nations using the metric system exclusively. As the people of these nations have long ago learned the superior conveniences of that system, they will not trade in any other if they can avoid it. Germany and France here have a decided advantage over England and the United States and have not been slow to improve their opportunities.

The practical sense of the Englishman is broadly awake to the fact that his obstinate adherence to a clumsy and unscientific system of measurement is one of the large factors in the relative diminution of English trade and manufacture, and he is almost sure to remedy this difficulty in the near future. What is true in England is even more true in the United States. We are only just beginning our efforts to win a fair share of the markets of the world, but many of our manufacturers

have already found it necessary to adopt metric units in the construction of electrical machinery for foreign export. At this particular time its general adoption would be of the greatest assistance to our foreign trade. Besides, we have recently brought into our fold a considerable population long accustomed to the use of the metric system, and our intercourse with them would be greatly facilitated by its adoption.

The Fifty-sixth Congress distinguished itself by providing for the establishment of a national bureau of standards—an act of the greatest importance to the electrical fraternity. May we not cherish the hope that the Fifty-seventh Congress will go a step further and legalize the metric system of weights and measures?

* * *

**Polyphase
Sub-station
Machinery.**

In view of the growing application of polyphase system of generation and transmission, combined with direct current distribution from sub-stations, to large lighting and power schemes, a paper just read before the Institution of Electrical Engineers in London by Mr. A. C. Eborall possesses interest, particularly as it is chiefly confined to practical questions of everyday working that have come within his own experience. Under the title "Some Notes on Polyphase Sub-station Machinery" Mr. Eborall first related the general ideas underlying the equipment and operation of polyphase sub-stations, subsequently giving some features of working, and a comparison of the different types of machinery that can be employed, together with details and examples taken from actual practice. High pressure transmission, and more particularly three-phase work, was the basis of the notes, which unfortunately are too lengthy to be published in full.

The conclusions which the author arrived at, assuming that it is required to convert polyphase into direct current by means of converting sub-stations, are as follows:

First—For power work, and for those cases where the amount of lighting to be done is relatively small, rotary converter sub-stations operated at 20 to 30 cycles are preferable.

Second—For lighting work the use of motor generators, operated at 40 to 50 cycles in the sub-stations, will give the best results. This is also the case when the lighting load on the sub-station forms a considerable proportion of the total output of the latter.

Third—Of the two classes of motor generator sub-station that equipped with asynchronous machinery is on the whole unsuitable for work of any magnitude.

Although in many cases direct current sub-stations are undoubtedly advisable, still in many cases the direct distribution of polyphase current from simple transformer sub-stations will undoubtedly be the best solution, not only from the technical, but also from the commercial point of view.

Rapid Transit
Company's
New President.**

At a meeting of the directors of the Brooklyn Rapid Transit Company on March 20 Mr. Clinton L. Rossiter, who has been president of that company for six years, handed in his resignation, which was accepted, and Mr. J. L. Greatsinger was elected in his stead.

The reason for Mr. Rossiter's resignation

has not been made public, but that it is generally considered for the best interest of the property may be inferred from the fact that when the news reached Wall Street Brooklyn Rapid Transit stock rose over four points.

The new president, Mr. Greatsinger, is a practical railroad man and is at the head of the Minnesota Iron Company, which includes the Duluth Iron Range Railroad Company. His experience will no doubt suggest numerous changes in the operation of the Brooklyn Rapid Transit system that will please both the public and the employees of the company. It is even suggested that a combination between the Brooklyn Company, the Metropolitan Railroad Company and the Manhattan Railway Company may follow the election of Mr. Greatsinger. An arrangement will be made, it is said, that will enable passengers to ride direct to Coney Island for one fare and without change of cars, by connecting with the Brooklyn Rapid Transit lines at the Bridge.

Furthermore, in all probability the franchise granting the privilege of using electricity for motive power and lighting will be exercised more fully than in the past. The alliance between the Brooklyn Union Gas Company and the Kings County Electric Light & Power Company and the Brooklyn Rapid Transit system becomes complete practically with the election of a new president, and these various concerns will be operated in the future so as to reduce expenses and at the same time afford better facilities to the public.

Taking it all in all, the action of the directors at their meeting on March 20 would seem to have been a wise one, and it is sincerely to be hoped that many of the trials and tribulations that Brooklyn travelers have had to put up with will shortly be things of the past.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

ARRANGEMENTS for the annual meeting of the Superintendents of Telegraph, made up of men having charge of the telegraph lines of the various railroads, were practically completed in Buffalo at a recent meeting of the committee appointed for that purpose. The dates fixed upon were June 18, 19, 20 and 21.

In a recent interview Nikola Tesla says the success of his enterprise is more assured now than ever and that within the next six months his invention will be given a practical test. He hopes to produce the proof that it is not beyond the range of possibility to establish communication across the ocean without the aid of wires.

MR. ALBERT L. JOHNSON is busy just now promoting the Philadelphia, Trenton and Lehigh Valley Railroad Company, which is to connect New York and Philadelphia by an electric trolley line, and he has caused to be spread broadcast the following modest statement: "Before the snow falls this year my electric road will be operating between Philadelphia and New York and carrying passengers for a forty cent fare. Within a year after it is running the fare will be reduced to five cents. I have already had every foot of land between my terminus down the bay and Trenton—the point at which the route leaves New Jersey—

surveyed. We shall run that entire distance on our own private land, skirting around the edges of the towns. There will be no stop between Philadelphia and the terminus down the bay, from which boats will run to South Ferry, and the seventy-five miles will be covered in an hour and a half. The General Electric Company will guarantee a fifty mile an hour speed at a certain price for a certain weight of cars. I have calculated every item of cost, including twenty-five cents an hour for each employee's wages, and I challenge any expert to dispute my figures."

In meeting the problem of making the Milwaukee, Wis., Industrial Exposition more interesting than it has been for some time, the directors have concluded to make a feature of an electrical display this fall. The exposition will be opened September 7 and close September 28. The building will be illuminated inside and outside by thousands of electric lights. Within will be displayed electrical machinery of all sorts. The exhibit will show the hundreds of uses to which electricity is applied. During the last week the Northwestern Electrical Association will have its convention there.

ONE of the most interesting uses to which it has yet been proposed to put the automobile is in establishing a regular conveyance line from the coast of Madagascar to the inland capital, Tananarivo. The distance is one hundred and fifty miles and the route is over the new road constructed by the French Government, and is to be covered in fourteen hours, although the grade averages six per cent. A repair shop will be opened on the island, and this will probably develop into a construction factory. At first the machines will be built in France.

J. B. CHARLESON lately returned to Vancouver, B. C., from Fort Simpson, where as superintendent of Government construction of telegraphs he started ninety men to work building a line to connect Fort Simpson with the main line, now almost completed between Vancouver and Dawson. Fort Simpson is on the route of the ships returning from the Klondike, so that before the summer is out, when passing this point, they can wire their approach to the outside world or report accidents or tragedies of the sea.

THE automobile show was opened in the Coliseum at Chicago March 23 and will last a week. The exhibits are large and comprehensive and include everything from the ponderous steam truck down to the cosy little runabouts which already dot the local boulevards. There are not less than 50 electric vehicles on the floor, hailing all the way from New England to St. Louis.

AN important stage in the progress of the construction of the new Government printing office at Washington, D. C., has been reached. The building will probably be ready to be occupied by the public printer about June 1, 1902, and it will then be the most complete and by far the largest workshop of the kind in the world. The estimate for the building is \$2,429,000 and expenditures up to the present time indicate that the cost will be within that amount. The most liberal use will be made of electricity to ventilate, cool and light the building, as well as to supply all the power.

Electric fans will be used to promote ventilation and there will be 7,000 incandescent electric lights and twelve electric elevators.

THE President on Monday appointed Frederick L. Allen of Auburn, N. Y., as Commissioner of Patents, to succeed Commissioner C. H. Duell, resigned. Mr. Allen is a director of the Empire Telephone Company of Auburn, and was at one time counsel for the Bell Telephone Company in patent litigation.

MARKED progress in electrical development is being made in India. It has recently been stated that the workshops of the East Indian Railway and of the Bengal-Nagpore Railway will shortly be driven by electricity. The old and time-honored arrangement of shafting, belts and pulleys is now, in fact, giving place to electric motors. But perhaps the greatest novelty of all is the new electric lift in the Government House. When using the lift one first presses a button, which brings the lift from whatever floor it has been left to that on which it is required. One enters the lift and finds a row of push-buttons, like electric-bell pushes, each one marked for a floor at which the lift may be wanted to stop. A button is pressed, and the electric current does the rest. In order to insure safety in working, the lift will not move until all the lift doors are shut. In a lift of this sort no attendant is required. While electricity from the supply company's mains thus elevates the Viceroy, it also lifts tea at the tea warehouse, works tea-packers, and drives many printing-presses throughout Calcutta. It is also used for working sewing-machines, and will shortly blow the cathedral organ.

CONSUL NELSON, at Bergen, Sweden, in a report to the State Department, says that a successful attempt has been made to produce steel by electricity in that country. Experiments are being carried on in a factory there, and already about 25,000 pounds have been produced, in six drafts daily. This steel is said to be of an excellent quality, and meets with ready sale at high prices. On account of the cheap method of production, the profits are declared to be large.

In regard to the *Conversazione*, to be held by the American Institute of Electrical Engineers on the evening of April 12 at Columbia University, we are requested to notify those who propose to exhibit that the current available at the University is as follows: 115, 220, 440 and 500 volts, direct current; 115 volts, two-phase, 60 cycle, alternating current; 115 volts, single-phase, 130 cycle, alternating current. All exhibits must be ready at the University on Saturday, April 6, and should be marked "*Conversazione*," care Prof. F. B. Crocker, Engineering Building, Columbia University, New York City."

An interesting review of the progress made during the past five or six years in the construction of electric cranes is contributed by Alfred Kolben to the "*Elektrotechnische Zeitschrift*." He points out, says the London "*Electrical Engineer*," how it was first sought to adapt the electromotor to the peculiarities of early types of transmission gears, the single motor crane marking the period of transition from the old system to the new. But this practice did not always yield satisfactory

results. Sometimes the rope pulleys of old cranes were substituted by belt pulleys driven by electromotors, after the winding gears, square shafts and auxiliary apparatus previously in use had become worn out and consequently unserviceable. But manufacturers at first showed little disposition to discard designs which had been evolved from much thought and experience; hence it was only natural that the most clumsy and dispensable portion of the early type of overhead traveler—i.e., the rope transmission—should be the first to concede its place to the electromotor. Gradually, however, manufacturers began to adapt their designs to the conditions of electric driving, and to-day there is no doubt but that the epoch of the single-motor crane is near its end. A decided majority of modern cranes are so constructed that each of the principal movements is accomplished by a special motor.

THE manufacture of carbon for use in electric lighting and for other purposes has grown to be a great industry in the West Virginia gas belt. The processes require great heat and the expenditures of large quantities of fuel, though the plant required for putting the carbon through the preliminary processes which consume the fuel is neither expensive nor complicated. Within the past six months thousands of acres of land, in territory proven to be largely productive of gas, has been bought or leased for the gas privileges.

FIRE CHIEF CROKER has requested Corporation Counsel Whalen to take immediate steps against the Rapid Transit Subway Construction Company of this city for the purpose of making repairs to Fire Department underground property between 62d and 125th streets in Broadway. It seems that the blasting done by the tunnel workmen has seriously damaged many of the conduits carrying the wires of the Fire Department, besides rendering the wires useless for fire alarm purposes. Nothing unusually serious has resulted as yet from the breaking of the Fire Department wires, but Chief Croker has given the contractors formal notice that the city will hold them strictly responsible for any damage. In view of the certainty that the contractors are going to rush their work as soon as the frost is out of the ground the officials took the precaution to protect the city's property.

THROUGH the courtesy of the New York Electric Vehicle Transportation Company, the New York Electrical Society will hold its 213th meeting at the new Main Station, Eighth avenue and 49th street, Wednesday (to-night), March 27, at 8 o'clock. Mr. G. Herbert Condict, consulting engineer of the company and of the Electric Vehicle Company, will deliver a brief address on "Automobiles in New York City." After the address visitors will be conducted through the station, which is by far the largest of its kind in the world, and having just been completed, represents the furthest reach in the automobile art at the present moment. The method of generating the current, charging the batteries, inserting and removing batteries from the vehicles, the inspection and dispatch of vehicles, and the whole routine of the vast system of handling daily hundreds of electric automobiles, will be illustrated in full operation.

It is rumored that the General Electric Company is considering the purchase of the Harmony Mills situated in Cohoes, N. Y., and the water power which is controlled by the Cohoes Company. The General Electric Company, it is said, should the purchase be concluded, intends to abandon the canals which are in use by the Harmony Mills and use electricity instead. The Harmony Mills consist of six large buildings, being numbered among the largest mills of the kind in the world and employing several thousand operatives. It is stated that the price for the property is between \$35,000,000 and \$40,000,000.

THE captain of the Ostend mail steamer *Princess Clementine*, which is fitted with wireless telegraph apparatus, reports, says the London "*Electrician*," that when on the voyage from Dover to Ostend the French lightship, stationed 25 miles off Dunkirk to mark some dangerous sand banks, signaled the mail boat. It was then learned that the lighting apparatus was out of order, and the lightship would be unable to show a light that night unless assistance was promptly sent. The mail boat at once dispatched a wireless message to La Panne, whence a telegram was sent to Dunkirk, and in a short time a tug was sent out to the lightship to effect the necessary repairs.

W. P. ATWELL, American Consul at Roubaix, France, writes to the State Department as follows: "Dr. Dussaud, of the Psychological Institute at Paris, gave a lecture on February 16 at the *Hospital des Sociétés Savantes* on the education of the blind and deaf. A large audience witnessed interesting experiments founded on his method for supplementing the senses of these two classes of unfortunates. The cinematograph for the blind is a machine which passes under the fingers of the blind, a series of reliefs representing the same object in different positions—the branch of a tree, a bird, or any other object. Dr. Dussaud has also arranged an electric vibration for the use of the deaf who are incurable. This gives them the motion of musical rhythm. For those who are not entirely deaf he has invented a 'gradual amplifier of sounds,' which supplements the organs of hearing and in some instances improves them.

THE switch lamps in the yards of the Atchafson, Topeka & Santa Fe Railway, at Ft. Madison, Ia., are, according to the "*Railway and Engineering Review*," lighted by incandescent electric lamps by means of a circuit entering the top of the lamp through a pipe which stands vertically about 2 feet clear of the stand and arches over to bring the wires above the top of the lamp. The wiring is brought to the arched pipe by means of an underground circuit. Some trouble has been experienced with this method of bringing the circuit to the lamp, as the switchmen, in throwing the switch, take hold of the pipe with one hand and the lever of the switch stand with the other, with the result that these pipes have frequently been pulled over and the circuit broken, the lamp socket short-circuited, or the filaments broken by the jar. Arrangements are now being made to change this method of leading the circuit to the lamp. By the new plan the circuit will be run up the switch stand and enter the lamp casing from below.

"Electricity's" Educational Series.

ARTICLE NO. 20.

THE TELEPHONE AND TELEPHONE PRACTICE.

Probably no branch of the electrical science has so rapidly advanced in its use and proportions as telephony. Since its first introduction practically no improvement or development has been made in the actual design, or principle of operation, of the telephone itself. As an example of this it may be observed that the telephone receiver that was first commercially used is practically the same as the one used to-day, and no marked improvement or change of design has been developed. However this is not so with the apparatus and circuits required in the development of the industry, for there is no question but that modern telephone engineering presents the most complicated and intricate branch of the electrical science.

The ordinary telephone receiver is one of the most sensitive of electrical instruments, and as an illustration of this it might be stated that one-millionth of the amount of electrical energy expended in the ordinary incandescent lamp would be sufficient if applied to a receiver to produce a distinct and audible sound. Consequently in the practice of telephone engineering, especially in large cities, it can be readily seen what disturbing conditions and emergencies must be contended with and how perfect in insulation and inductive relation lines and circuits must be made and maintained.

FIG. 1.

The first telephone depending on the operation of electric waves was invented by Alexander Graham Bell about twenty five years ago and was exhibited by him at the Centennial Exhibition at Philadelphia.

The original practical apparatus exhibited by Prof. Bell consisted of an instrument the same as the ear piece or receiver now used on all telephones.

I will not dwell on the shape and construction of a receiver, for that is familiar to all, but rather on the principle involved in its operation.

By connecting two of these receivers, one on each end of a line, as in Fig. 1, corresponding sound vibrations could be produced at one end, to those acting upon the other. Suppose A B to represent two receivers connected in a line and X X the permanent bar magnets with the coil, or spool, of insulated wire on the ends closest to the iron diaphragms D D. Of course a field of magnetic force will surround the bar magnet and most of these lines will pass through the coil of wire and diaphragm in their path to the opposite pole. If sound vibrations, for instance, produced by the voice, strike the diaphragm they will set it in motion, vibrating in unison with the sound waves. The effect of this iron vibrating close to the end of the magnet is to effect the lines of force, for as it approaches the magnet the lines of force

which enter it increase considerably, and as it moves away decrease in proportion. In this manner the distribution of the lines of force about the end of the magnet is changing continually with the vibrations of the diaphragm, and consequently the number of lines of force passing through the coil of wire on the magnet will be correspondingly increased and decreased. It is known to be a fact, by experiment that when a change occurs in the lines of force acting on a coil electrical action is set up in the coil. The electrical pressure being in

FIG. 2.

one direction when the lines of force are increased, and in opposite direction when the lines of force are decreased. Consequently a rapid succession of alternating current waves will be set up in the coil and line to which it is attached. These current waves will correspond exactly in frequency with the vibrations of the diaphragm which is causing their action. Now, as in Fig. 1, if two of these instruments be connected on a line and the diaphragm of one is set in motion by the voice, then the electric waves produced by its action will travel over the circuit, acting on the coil of the other instrument, and will set in motion the lines of force which pass through it and are attracting the iron diaphragm on it. The effect produced by the current waves on these lines of force will be the same as the effect produced at the other end by the diaphragm, so that the second diaphragm will be caused to vibrate by magnetic changes at just the same rate as the one at the other end, and in fact in unison with

FIG. 3.

it, so that a similar sound will be given out by one diaphragm to that acting upon the other.

Although this makes an extremely sensitive and very satisfactory receiver, yet it is not sufficiently powerful as a transmitter for commercial use. The transmitters that are now generally used involve an entirely different principle, and when used in connection with the apparatus just described, as a receiver, give us the telephone complete as we know it to-day. The principle of the transmitter is to cause an increase and decrease in the rate of flow of an established current by means of sound vibrations. This involves a variation in the resistance of a circuit by the action of a diaphragm, set in vibration by sound waves, acting upon a certain part of a circuit over which

a current is flowing, to cause a continually changing resistance in the circuit, thereby increasing and decreasing the amount of current flowing. This can be more fully explained by

FIG. 4.

giving a description of a Blake transmitter, which was about the first invented to become commercially used. Fig. 2 is a diagram of such a transmitter and consists of a diaphragm A, a small platinum ball B attached to a fine german silver spring and a smooth polished carbon block, C, attached to a steel spring much heavier than the other one. The carbon block rests lightly against the platinum tip which in turn rests against the iron diaphragm. The tension of the spring attached to the carbon may be adjusted by the screw D.

If the diaphragm of the Blake transmitter is set in motion by sound waves it will cause the platinum tip to press more or less lightly on the carbon surface, thus varying the resistance of the contact. As this contact comprises part of a circuit over which a current is flowing, as described in the figure, the varying resistance will throw the current into waves which will correspond with the vibrations of the diaphragm. Now if a receiver E be connected in the circuit, the current passing through its coil will increase and decrease the strength of

FIG. 5.

the magnet and its diaphragm will be set in motion, giving out sound corresponding with that acting on the transmitter diaphragm as already explained.

This style of transmitter is seldom if ever used except with an induction coil, Fig. 3. This consists of two windings, termed a primary and secondary wound on a core of soft iron wire. The primary is usually a few layers of comparatively heavy wire while the secondary may consist of many turns of fine wire. The induction coil is used to intensify the effect of the transmitter by connecting the primary winding in circuit with the transmitter and battery and the secondary winding in the line with the receiver. This makes it possible to talk long distances, as the current waves will be much more intense in the secondary governed by the inductive relation which the secondary bears to the primary. This can be readily understood by referring to previous articles on induction.

Fig. 4 describes a telephone circuit com-

plete where induction coils are used and also shows the place each part of the telephone occupies in a circuit.

The commercial telephone of course must be provided with means for opening and closing the battery circuit and also the line. This is done by the use of an automatic hook operated by the weight of the receiver. Fig. 5 gives the complete circuit of what is known as an ordinary local battery telephone.

Article No. 21 will be entitled "The Telephone and Telephone Practice" (continued).

LONDON NOTES.

(From our London Correspondent.)

English Electricity Works and Coal Supply.

The yearly reports of the various London and provincial electricity supply companies are now appearing. Every one of such undertakings has been somewhat severely tried by the high price of fuel and materials during the year 1900. In some cases the profits and dividends have been reduced as compared with the previous year, and this coal question is given as the cause; in others, where larger profits were anticipated than in preceding years, this has not been realized. In fact instead of there being apparent a desire to still further reduce the charges for electrical energy, the feeling is in some places favorable to an increase. Of course, it goes without saying that in nearly every place the lamp connections, and the consumption of energy are rapidly increasing, and everywhere more machinery is being put down. The general tenor of the reports is that the price of coal is now down, and will go lower, so that electricity works will be enabled to enter into better contracts. Very much the same remarks apply to the reports also being issued by municipal authorities. There is not likely to be a general cry of large net profits, as has occurred sometimes, for in addition to the higher expenditure upon fuel, there has to be taken into account the fact that many towns are adopting the policy of keeping the price per unit low, and increasing the demands still further, rather than having a surplus to hand over to the reduction of the general public rates.

Electrical Work at the Glasgow Exhibition.

English electrical engineering firms are making great efforts to be adequately represented at this international exhibition, which opens in May for about six months, and things begin to look like a great success. The English manufacturer has not done much exhibiting of electrical machinery since the Crystal Palace Exhibition of 1891. He did not put in anything like a representative appearance at Paris last year. These two facts have probably urged him to make an effort at Glasgow. Americans will doubtless be so taken up with their great Pan-American Exposition that they will devote little attention to Glasgow, but it may be remarked that anyone who is anxious to see what English and Scotch electrical engineering practice is will find it in evidence at Glasgow. Glasgow, in addition, is to be the great meeting place of all the scientific and engineering institutions this year, on account of the exhibition. There will be an International Engineering Congress from September 3 to 6 and in this all our great engineering bodies will take part. There will be eleven sections, one being devoted to electricity. This department will be conducted by

the Institution of Electrical Engineers, with Prof. John Perry as its president. The British Association opens its congress a week later. The Municipal Electrical Engineers hold their week's convention in the same city at the end of June. The large new municipal electricity works is completed, and the extensive electric tram system with its multiphase power station is to be inaugurated during the coming summer.

AN AUTOMATIC EARTHING DEVICE FOR TROLLEY WIRES.

Having regard to the fatal accident which recently occurred in Liverpool, says the "Electrical Engineer," London, we would call attention to an article by Mr. R. Ulbricht which appeared in the "Elektrotechnische Zeitschrift" for May 7, 1896. An arrangement is described therein for guarding against accidents due to the falling of telephone or other wires across trolley lines. It is based on the principle of a momentary connection between the trolley wire and earth, causing a direct connection between the same, which remains until the apparatus is reset by one of the tramway officials. The efficiency of the system is largely dependent on the employment of an automatic earthing device of very simple construction, which may serve to protect simul-

The automatic earthing device, although of only temporary construction, worked without a hitch. At each fall of the telephone wire across the guards the voltmeter immediately registered zero. The protection afforded was so complete that when a fuse of only eight ohms resistance for a maximum current of one-third of an ampere was inserted in the falling wire, it did not melt. In the last test the falling wire fused the guard wires, which had been previously weakened in many places by partial fusion, but the momentary contact had sufficed to establish a dead earth connection on the trolley wire.

An additional advantage claimed for the automatic earthing device is that it enables the guard wires to be of relatively small diameter, since they have to carry but a momentary current, and by suitable arrangement may be made to do their duty even should a large fall of telephone wires cause them to break. Further, the automatic device may be tested daily as to its condition in a similar manner to that in which automatic cut-outs are tested.

SINGLE-PHASE ALTERNATING PLANT AT FRANKFURT-AM-MAIN.

BY FRANK C. PERKINS.

The Central Station at Frankfurt-Am-Main,

FIG. 1.—ENGINE AND GENERATOR ROOM AT FRANKFURT-AM-MAIN.

taneously several points crossed by telephone or other wires. Momentary contact between a telephone wire, the trolley line, and one of the earthed guard wires is sufficient to complete the earth connection. This causes the automatic cut-out provided in the generating station for the protection of the line to act, while the short-circuit indicator will continue to indicate the disturbance until the earthing device in the proximity of the trouble has been reset.

The arrangement has been largely adopted and was subjected to a severe test in Leipzig, where the falling wire was on the one side connected with the apparatus to be exposed to danger and on the other direct with the rails. Between the trolley wire and earth a voltmeter was inserted to enable the degree of security afforded the street traffic to be gauged.

Germany, is a single-phase alternating current plant and has a total capacity of about 10,000 hp. The accompanying illustration, Fig. 1, shows the interior of the engine and generator room, while Fig. 2 illustrates the armature wheel of one of the large 1,500 hp., single-phase alternators built by the firm of Brown, Boveri & Cie of Baden, for this power house. This installation is designed for both a lighting central station and also a power transmission plant.

The station is equipped with four units of 750 hp. and four units of 1,500 hp. These generators are of the single-phase type supplying a current of a potential of 3,000 volts, each being directly coupled to a horizontal tandem compound condensing engine, as shown in the illustration. Each alternator is supplied with a direct current exciter mounted on the end of

the alternator and engine shaft outside of the main bearing. Besides the lighting load, which amounts to more than 5,000 hp., there is a power distribution of about 4,000 hp. The motors used on the power transmission circuit are single-phase machines and vary in size from 1-10 hp. to 150 hp.

The converter station for the Frankfurt Tramways has a total capacity of 4,700 hp. The equipment consists of three motor generators, the motors of which have a capacity of 750 hp. each, and one motorgenerator of 90 hp. capacity, all of which are made up of high tension synchronous motors of the single-phase type directly coupled to continuous current dynamos. The motors operate at a potential of 2,850 volts, and the motor generators transform the alternating to a direct current for

FIG. 2.—ARMATURE WHEEL OF 1,500 HP. SINGLE PHASE ALTERNATOR AT FRANKFURT-AM-MAIN.

use on the tramway feeder circuits. The generators are multipolar machines of the six pole type and supply a continuous current of 550 volts. Among the other large central station plants installed by Brown, Boveri & Cie of the single-phase type of generators is the Elberfeld Municipal Electricity Supply Works. This plant is supplied with generators of a total capacity of 3,500 hp., consisting of three units, one of which is a direct-connected single-phase alternator operated by a 1,500 hp. horizontal compound condensing engine, and the other two single-phase machines of the Brown, Boveri type, driven directly by two engines of 1,000 hp. each. This plant supplies current for both lighting and power distribution.

Electric Railways.

Major Phillip Cardew is delivering a series of three lectures at the Society of Arts in London. The first lecture, delivered on March 11, covered generally the application of electricity to underground lines, and the advisability of its use for long-distance lines. The latter, he said, was a question of expediency and cost. He did not doubt but that a 120 miles an hour speed could be accomplished, but whether it would pay to provide such a service within the limits of the British Isles.

A NEW OSCILLATOR FOR STATIONARY ELECTRICAL WAVES.*

BY DR. BERNOUILLI.

Since the researches of Hertz,[†] who first succeeded in measuring the length of electrical waves, numerous experimenters have striven to improve upon his methods, and especial attention has been given to the production of oscillations of shorter wave length. As is well known, Hertz, in his experiments, used two large oscillator plates to each of which was attached a wire terminating in a metal ball. The terminals of an induction coil were connected to the plates, and the latter were so placed that the oscillatory discharge of the coil could take place across a spark-gap left between the balls. Opposite one of these

then stretched out parallel to one another. Suppose now that with this arrangement one of the oscillator plates is charged with positive electricity; the condenser plate opposite immediately becomes negatively electrified by induction, and positive electricity is repelled from it through the wire. At the same time the other oscillator plate is negatively charged and induces positive electricity in the condenser plate opposite it, repelling negative electricity into the second wire. The result of this is that, as the induction coil is operated, points on the wire opposite one another always possess charges opposite in sign. In case the wires are bridged over by a metallic conductor, then the potential at the middle of the same must be zero, since the advancing potential functions on both sides of the middle are equal and opposite in sign—the potential wave has then a node at this point.

As in the case of a vibrating cord, so with the oscillator, waves of different length are sent out (the fundamental and its overtones). To prevent mutual disturbances it is necessary to isolate some one of these waves. To do this it is only necessary to so adjust two bridges placed on parallel wires that the distance between them is equal to some multiple of a half-wave length of that particular oscillation period. Waves of other periodicity are then destroyed by interference.

FIG. 1.

In order to show the presence of nodes and loops, Lecher placed a Plücker tube over the parallel wires. This tube lighted up when brought to a place over the wires where the fluctuations in potential, and consequently the P.D. at its electrodes reached a maximum—that is, at the loop of the wave. At the nodes, however, where there is no P.D. between the wires, the tube did not light up at all. A similar method was employed by Cohn and Heerwagen,^{*} also by Rubens.[†]

Aronst[‡] sealed the two wires into a glass tube which was about 2 m. long and connected with an air pump. In a darkened room the wires at the nodes were invisible, but at and for some little distance on both sides of the loop they were highly luminous.

To those demonstrators who wish to avoid the trouble of using an air-pump in connection with this experiment, and who have at their disposal a high-frequency coil, I recom-

* More exactly until the distance between the bridges plus one-half their combined length is equal to some multiple of a half-wave length.

† Such a Lecher apparatus is described in Weinhold's "Physikalischen Demonstrationen," III, Aufl. p. 840.

* "Wied. Ann.," 48, p. 368, 1891.

† "Wied. Ann.," 42, p. 154, 1895.

‡ "Wied. Ann.," 45, p. 553, 1892.

† "Wied. Ann.," 81, p. 551, 1898.

‡ "Wied. Ann.," 41, p. 860, 1890.

ment the Blondlot-Coolidge oscillator (made by E. Leybold's Nachfolger, Cologne). By the help of this apparatus the nodes and loops of stationary electrical waves can be shown on wires which are not in a vacuum, but in the open air. This apparatus has also the advantage of enabling one to isolate, measure, and if desired, photograph several of the overtones as well as the fundamental.

The Hertz oscillator plates are replaced by two semi-circular conductors (Fig. 1) which terminate at one end in small brass spheres, and are connected with the secondary terminals of a high frequency coil. The sparks which give rise to the electrical oscillations pass between the two brass spheres. A second spark-gap serves to increase the intensity of the oscillations. Both spark-gaps can be very delicately adjusted by means of insulated screws. Directly beneath this primary circuit of the oscillator and insulated from it by means of a sheet of mica is a secondary circuit. This latter consists of a wire bent into a circle of the same radius as the primary circuit, its ends terminating in the binding screws, c and d, and corresponds to the condenser plate of Hertz's apparatus. The vessel in which the two circuits are fastened is filled with kerosene. The copper wires (0.1 mm. in diameter) are held at one end by the screws c and d, and at the other by the insulated stand B. The ring K serves to darken the glass vessel.

If the apparatus is set in operation and the spark-gaps are properly adjusted, the wires become highly luminous throughout their entire length; and if now, by bridges properly placed on the wires, stationary waves are allowed to form, the wires at the nodes for a length of a few centimeters become invisible, while the other portions, and especially those half way between the nodes (the loops) remain luminous.

CHIMNEYS AND STACKS FOR STEAM BOILERS.*

BY W. H. WAKEMAN.

The statement that a chimney or stack is necessary to create draft under a steam boiler, except where forced draft is used, will occasion no surprise, because it is a self-evident truth. But all of the necessary appliances are not equally efficient, and in some cases the cause for the deficiency may be easily traced out, while in others it requires careful investigation in order to locate the trouble.

The theory of the cause for draft in a chimney is well known, but no other theory in relation to engineering is more persistently doubted, by the "practical" man, and there are not sufficient causes to warrant this continued opposition. I have never met a man who doubted the theory and could substitute a better one for it; the large majority of unbelievers do not attempt it.

This theory is as follows: Currents of air vary in density, consequently the more dense parts seek the lowest level, while the lighter parts rise as high as possible. As the lighter parts rise the heavier parts are drawn in to take their place, and if this process takes place in a chimney, and the only entrance to the base of it is through the furnace of a steam boiler, a draft will be created, the force of which will depend upon the comparative densi-

ty of the air, and gases inside and outside of the chimney, and for convenience sake this force is measured in inches of water.

From this it is evident that the lighter the gases are in the chimney the stronger will be the draft, so that while a high temperature of escaping gas denotes that much of the heat in the coal burned has not been absorbed by the boiler, and hence is at least a partial loss, the draft is increased over what it would be with a lower temperature; therefore, more power can be developed by the plant.

In many cases chimneys do not give as much draft as they were expected to, and are therefore considered detrimental to the economical combustion of the coal burned, and are condemned by the engineers in charge. The objects sought in writing this article are to point out some of the causes that are responsible for this undesirable state of affairs, in order that the blunders made may be rectified in the best way, while others may profit by the suggestions here offered and avoid future failures along this line; also, to show that the problems of chimney design are not as complicated as certain mysterious formulae used in this connection, in works on the subject would naturally cause us to believe.

In many cases the surrounding objects will determine the necessary height of chimney, for it would be a mistake to erect a chimney 100 feet high near a building that stands 125 feet above the ground, as the draft would be poor.

For the purpose of illustrating the rules to be given and explained, I shall assume that the chimney is to be 144 feet high, the temperature of the air 60° Fahrenheit and of the gases 500° Fahrenheit.

The draft will be determined by the difference in the density of the air and the gases, and by the height of the chimney. The density will vary as the absolute temperatures, and for the air it may be determined by dividing the absolute temperature of melting ice by the absolute temperature of the air, and multiplying the quotient by .0807. As the absolute temperature of a body or of gas is 461° more than its temperature by the thermometer, it is $32 + 461 = 493^\circ$ for melting ice. The absolute temperature of the air is $60 + 461 = 521^\circ$.

Then $492 \div 521 \times .0807 = .0763$.

The density of the gases is found by dividing the absolute temperature of melting ice by the absolute temperature of the gases, and multiplying the quotient by .084. Then $493 \div 961 \times .084 = .0430$.

Using the foregoing data we can determine the draft in inches of water by subtracting the density of the gases from the density of the air, and multiplying the remainder by .192 and again by the height of chimney in feet. Then $.0763 - .0430 \times (.192 \times 144) = .92$ inches of water.

I have given this example because it explains the process, but where no explanation is desired the following rule may be used, as it gives nearly the same result. Divide 7.66 by the absolute temperature of the gases and subtract the quotient from .0146. Multiply the remainder by the height of chimney in feet. In this case it is $7.66 \div 961 = .00797$, and $.0146 - .00797 \times 144 = .95$ inches of water.

For the same temperature, the draft for any other height may be found by proportion, as it varies with the height. For a chimney 200 feet high it is as follows: $144 : .92 : 200 : 1.27$ inches of water.

Disappointment is the result of expecting that the actual draft will equal this, as it will not; and yet the calculation so far given is correct, but no allowance has been made for the friction of the gases as they pass upward through the rough and sooty chimney or stack, and for ordinary cases, 10 per cent. should be deducted for this, which leaves .93 inches of water for the first illustration given.

Where we need the draft at the grate where the fuel is burned, and between this and the chimney, the passageway contains several obstructions in the form of a contraction at the bridge wall, where tubular boilers are used, a return bend in the combustion chamber, a division of the current when passing through the tubes, a right angle turn at the front end of the boiler and another one when the nearly horizontal flue is reached, and perhaps one or two more before the chimney is reached. About 25 per cent. reduction must be made for these, leaving an available draft of $.93 - (.83 \times .25) = .63$ inches of water, and where several boilers are connected to the same chimney, it may be expected that some of them will realize more of the draft than others. These rules for chimney draft are based on the assumption that the gases maintain a uniform temperature throughout their ascent through the shaft, but this is not true in practice, for as they travel farther away from the boiler, the temperature is reduced, thus bringing the density of them nearer that of the outer air. This will detract from their drawing power, and still it must be remembered that as the temperature is lowered, the volume is reduced, so that one tends to offset the other.

As already mentioned, some men dispute this theory, and, as evidence in their favor, point to the fact that a chimney will draw when there is no fire to heat the air in it. This is not strange, for in many cases it is heated by natural means, which answer every purpose. If the sun shines on an iron or steel stack, the internal air is warmed more than the outer, and draft is created. Even when the sun does not shine on it, the inside of the shaft is not exposed to the wind, hence it may be much warmer than the wind that blows against the outside of it.

Draft does not exist in all chimneys when cold, for I have had to build a fire at the base of the shaft, or in the breechen of the boiler, on several occasions in order to make the chimney carry off the smoke of a fire on the grate.

It is not a difficult matter to measure the draft of various chimneys, and note the results, taking their height and other conditions into consideration, when it will be found that sometimes a high chimney will give no more draft than a lower one does in another locality, but in all such cases there is some reason for the results, although it may not appear on the surface. A few years ago much was written concerning the great advantage of having a chimney flue larger at the top than at the bottom, and apparently very good reasons were given for the plan, but where one built in this way did give good results, we were never sure that some other condition was not responsible for the desirable condition of affairs.

I never knew of but one case where a stack that was larger at the top than at the bottom was taken down and reversed. This was of much interest, because it was set up again in the same locality, and the same boilers were used. After the change there was not enough difference to be perceptible in every day ser-

*Blondlot, "Comptes Rendus," 114, p. 283, 1892; Coolidge, "Wied. Ann.," 67, p. 578, 1899. See also Drude, "Zeitschrift f. Phys. Chem.," 23, 267, 1897.

*From "Modern Machinery."

vice, but a carefully graduated draft gauge showed a slight improvement with the small end of stack uppermost. As already observed, the ascending gases become cooler, and hence are reduced in volume, and therefore there is no logical reason for the top being the largest.

It is important that we know the amount of coal that it is possible to burn in one hour on each square foot of grate surface, and for making this calculation Prof. Thurston gives the following rule: Multiply the square root of the height by two and subtract one from the product. In this case it is 23 pounds.

Now I have no doubt that this rule is correct, for it is based on the results of experiments made and it can be, and is done in every day practice, but it results in a lower efficiency than can be secured by a slower rate of combustion, and where this rule is applied to lower chimneys with feebler draft, in order to burn the coal it calls for, it becomes necessary to "break the fire up" at short intervals, where bituminous coal is used, and every time this is done some of the good material is lost through the grates, and there is no help for it. When anthracite coal is used, the fires must be cleaned often, which results in a direct loss.

If a mechanical engineer should design a plant with the expectation of burning this amount of coal for ordinary service, it would be a great mistake. I would reduce it by 40 per cent., making it 13.8 pounds, as that is the most that should ever be burned, and when the load is lighter (as it varies in almost every plant), the amount would be less. Still, this would admit of an increase for short periods without serious detriment. It is proper to make the area of a chimney large enough to burn the maximum amount of coal that can be used on the grate, and then it can easily dispose of the smoke and gases resulting from any smaller quantity. This makes it necessary to know the number of square feet of grate surface, and for illustration it is assumed that there are three boilers, each having 30 square feet of grate surface. We then have 90 square feet, and 23 pounds for each, or 2,070 pounds per hour as the maximum quantity that can be burned.

The area of chimney in square feet is found by dividing the pounds of coal burned per hour by the square root of the height, multiplied by 12. In this case it is $2,070 \div 144 = 14.4$ square feet.

The diameter of a round flue that will contain this area is found by dividing by .7854 and extracting the square root of the quotient; $14.4 \div .7854 = 18.5$, the square root of which is 4.3 feet. If a square flue is wanted, it should not be less than four feet, because the corners are of little value, for the friction of the gases as they ascend in these parts is excessive, hence they may be ignored in a case like this. The horse-power of boilers that may be operated by this chimney can be determined by dividing the coal burned by 5, and $2,070 \div 5 = 414$ horse-power.

The allowance of five pounds of coal for a horse-power may be considered excessive, but it is customary to make this allowance, in order to be on the safe side. Automatic engines require less than this as a rule, but pumps require much more.

If it is desired to calculate the required area of flue by the horse power of chimney, it may be done on the same basis, by dividing the horse power by .2 of the height. Applying it here shows that the area is $414 \div (.2 \times 144) = 14.4$ square feet. It is much better, however,

to calculate directly on the amount of coal burned.

I am convinced that some reader will look over these calculations, and then find one or more chimneys that are not as large as they call for, so that a text will be afforded for another sermon on the difference between theory and practice, but I will make such investigations unnecessary by saying that I know of such cases right in the vicinity of where this is written, but they prove nothing against theory. If it could be proved that the best results are secured where such monstrosities are in use, then theory would have to be discounted, but as this is not done it will have to stand approved.

I will mention the essential features of a case with which I am well acquainted. The horizontal flue leading from a battery of boilers to a chimney is of the right size to suit the capacity of the steam generators, but the chimney area is only a trifle more than one-third of the flue area. This plant is run nearly every working day in the year, but an investigation of the practical results, and an interview with the engineer in charge, would convince the most skeptical that there is chance for much improvement.

In another case the brick chimney of a small plant did not give satisfaction and the owner put an iron cap on the top of it in which was a hole smaller than the conditions called for, and over this was erected an iron stack, which showed that the designer believed in having it high enough, but cared nothing for the area.

A certain class of objectors claim that it is not necessary to have a strong draft because the damper regulator is shut for a portion of the time, so it is just as well to have less draft, and let the damper be open for a greater portion of the time. This is a mistaken idea, for the fire should burn briskly while the draft is on, and when the required steam pressure is secured, it should be shut off until the pressure is slightly reduced. A good damper regulator will attend to this duty in a perfect manner. The philosophy of this is that while the draft is strong the combustion is more complete than when it is feeble. Another reason is that under these conditions much of the soot is swept through the tubes instead of being left in them; consequently the boiler gives better results from the fuel burned under it.

In some cases it may be convenient to know the power of a certain chimney to burn coal, as for instance where an old chimney is to be used for a new plant of boilers, or where a new chimney of a given size may be desired. This may be determined by multiplying the area in square feet by 12 and the product by the square root of the height. Suppose that a chimney is 120 feet high with a round flue 5 feet in diameter. The area is 19.6 square feet, and the square root of height is 11. Then $19.6 \times 12 \times 11 = 2,587$ pounds per hour.

According to a rule already explained, a chimney 120 feet high will burn 21 pounds of coal per hour on each square foot of grate. By dividing the total weight burned, by the latter, we find that the chimney will furnish draft for $2,587 \div 21 = 123$ square feet of grate, and for four boilers it will be 31 feet square feet for each.

I have noticed that in several cases where chimneys have not given satisfaction, they have been built higher in order to increase their capacity. This is good practice, but I wish to call attention to the fact that while

the force of the draft increases directly as the height is increased, its capacity for burning coal increases only as the square root of the height. This is an important point, for if it is not understood, disappointment may result, where an addition is built on to a chimney. If a chimney 80 feet high does not give sufficient draft, and it is possible to build it 80 feet higher, the force or intensity of the draft should be very nearly doubled.

To conclude that it will be possible to burn double that amount of coal with it would be a great mistake. Each pound of coal requires a certain amount of air for its combustion, and the amount passing into the furnace of a boiler will, of course, depend upon the rate at which it travels. Now the intensity of the draft denotes the pressure that is forcing air into the ash pit and up through the grates, but if this force is multiplied by two, the speed will be increased as the square root of two, which is 1.44. It follows as a natural consequence that if it is necessary to double the amount of coal burned, the height of chimneys must be multiplied by four, and if great exactness is desired enough more must be added to overcome the friction of the increased length of shaft.

A few years ago, if I had been called upon to decide whether to use a brick chimney or an iron stack, I should have favored the brick structure without hesitation, because iron stacks were proving failures after a few years of service, while bricks and mortar were not ruined by the different kinds of gases traveling upward, and were affected little by the rain traveling downward, while a coat of paint every year or two was not necessary.

Conditions are somewhat different now, for steel has replaced iron, proving much more durable, while improved methods have made it possible to erect these stacks and keep them in place during heavy gales without guys of any kind, to that as far as present experience will warrant an opinion, the two kinds are about on a par.

Before closing this article I wish to correct a mistaken idea that is often expressed by thoughtless people concerning the cause of a poor draft on some days where it is usually very good. Whenever the smoke curls lazily out of the chimney, and then seems inclined to come down to the ground instead of going into clouds, the remark is made that the draft is poor because the air is "heavy." If this is disputed, attention is called to the fact that the smoke comes downward, as truth of the proof of it.

The foregoing calculations concerning chimney draft were made with the assumption that the barometer stood at a certain given point and that the density of the air would correspond. If the barometer shows that the air is indeed heavier than the standard taken, the difference between the density of the air and of the gases will be greater, hence the draft will be stronger and not weaker. On the other hand, if the barometer shows the air to be lighter, the comparative density will be less, and as a natural consequence the draft may be less, in direct contradiction to the popular expression.

Dr. William F. Channing Dead.

Dr. William F. Channing, son of the philosopher, Dr. William Ellery Channing, died at the Perry Hospital in Boston on the 20th inst., aged 81 years. He was graduated in the class with Dr. Edward Everett Hale and later took

a doctor's degree from the University of Pennsylvania. He lived in Providence for many years. Pneumonia and a breakdown, due to advanced age, caused his death. Dr. Channing never practiced medicine, but was an inventor of great skill. The fire alarm telegraph, the marine railway and a score of appliances for use in electricity were his work.

IMPORT DUTIES IN THE ENGLISH COLONIES.

In view of the fact that American manufacturers of electrical machinery and appliances are reaching out for markets for their goods in the various English colonies, the rates of import duties leviable on electrical machinery and apparatus in those countries may not be without interest at this time.

BRITISH GUIANA.

Machinery and wire for electric lighting, free.

Machinery and apparatus for the original construction of an electric tramway in Georgetown, by the Demerara Electric Company, Limited, free.

Other machinery, part free, part 15 per cent. ad valorem. Under the last classification, machinery imported is subject to a deduction of 5 per cent. on the duties leviable at the rates given, provided the reciprocal trade convention between Great Britain and the United States in respect of British Guiana does not come into operation.

Implements for electric lighting, imported by the Mayor and Town Council of Georgetown or of New Amsterdam, for lighting any street or place belonging to them, or subject to their control, free.

Telegraph instruments and other materials imported by telegraph companies and necessary for the construction and use of their works, offices, and stations in the Colony, free.

Other, 15 per cent. ad valorem, subject to the same conditions as for "other machinery," above mentioned.

CANADA.

Glass bulbs for electric lights, 10 per cent. ad valorem.

Electric or magnetic machines for separating or concentrating ores, free.

Telephone or telegraph instruments, electric and galvanic batteries, electric motors, generators, dynamos, sockets, insulators of all kinds, and electric apparatus not elsewhere specified, 25 per cent. ad valorem.

Electric light fixtures, or metal parts thereof, including lava or other tips, collars, galleries, shades, and shade holders, 30 per cent. ad valorem.

Carbons, over six inches in circumference, 15 per cent. ad valorem.

Other electric light carbons and carbon points of all kinds, 35 per cent. ad valorem.

Steam and portable engines, boilers and machinery, composed wholly or in part of iron or steel, 25 per cent. ad valorem.

Wire, single or several, covered with cotton, linen, silk, rubber, or other material, including cable so covered, 30 per cent. ad valorem.

Other wire cable and stranded or twisted wire, 25 per cent.

Copper wire, plain, tinned or plated, 15 per cent.

Platinum wire, free.

[Note—In accordance with the provisions of

the British preferential tariff of 1898, as amended in 1900, articles which are the manufacture of the United Kingdom, when imported direct from that country, are entitled to a reduction of one-third of the duty.]

CAPE OF GOOD HOPE.

Machinery to be driven by electric power (including spare parts) and apparatus and appliances used in connection with the generating and storing of electricity, but not including electric cable, or wire, or the posts for carrying the same, and not including lamp posts, lamps, or their fitting, free.

Telegraphs and telephones, materials and instruments for use in construction and working of telegraph or telephone lines, free.

A rebate of the whole of the customs duties is allowed on the following goods imported into the Cape of Good Hope on their removal to places other than Natal, Orange River Colony, Basutoland and the Bechuanaland Protectorate, provided such places are open for trade, viz: Electric cable or wire and posts for the same, and their fittings; electric lamp posts and their fittings; electric lamps and switches, not including fancy or ornamental lamps, switches and fittings for indoor lighting, and signaling wire, bells and gongs, for use in or about mines. On other dutiable goods a rebate of 4½ per cent. is allowed.

CEYLON.

Prime movers and machinery (and component parts thereof), meaning machines or sets of machines to be worked by electrical power, free. The provision is made that only such articles shall be admitted as component parts of machinery as are indispensable for the working of the machinery, and are, owing to their shape or to other special quality, not adapted for any other purpose.

Instruments, scientific, or if intended for the professional use of passengers, free.

INDIA.

Prime movers and machinery, and component parts thereof, meaning machines or sets of machines to be worked by electric power, free.

Dynamos, accumulators, motors and electric fans, free.

Other (except telegraphic instruments and apparatus, and parts thereof, when imported by or under the orders of a railway company, or instruments, apparatus and appliances when imported by a passenger as part of his personal baggage and in actual use by him in the exercise of his profession or calling, which are free) 5 per cent. ad valorem.

JAMAICA.

Apparatus and appliances of all kinds for generating, storing, conducting and converting into power or light and measuring electricity, free.

Telephones and telephone switchboards, free.

Other, 16½ per cent. ad valorem. Telegraph materials imported into Jamaica by the International Ocean Telegraph Company, or by the Direct West India Cable Company, free.

MAURITIUS.

All kinds, 10 per cent. ad valorem.

NATAL.

Machinery to be driven by electric power (including spare parts) and appliances and apparatus used in connection with the generating and storing of electricity, but not including electric cable, or wire, or lamps or their fittings, free.

Telegraphs and telephones, materials and

instruments for use in construction and working of telegraph and telephone lines, free.

Other, 7½ per cent. ad valorem, with the same provision for rebate as applies to the Cape of Good Hope, as already noted.

NEWFOUNDLAND

Telegraph and telephone instruments, electric and galvanic batteries, 30 per cent. ad valorem.

Electric motors, dynamos, generators and sockets, 20 per cent.

Electric light fixtures or metal parts thereof, lamp springs and bulbs, electric meters, carbons and carbon points, and electric light material of every description, 30 per cent.

Insulators and other electrical apparatus, 20 per cent.

Copper wire, 30 per cent.

On all the above an additional charge of 10 per cent. on the duty leviable at the rate given.

NEW SOUTH WALES.

All kinds, free.

NEW ZEALAND

Electric machinery and appliances, including electrical hoists, electric light apparatus for dredging plants, electric motors, hand dynamos, and electric fans, 10 per cent. ad valorem.

Engines for electric lighting machinery, 20 per cent.

Electric cooking or heating apparatus, 20 per cent.

Brackets, standards, electroliners, and other fittings for distributing the light, 20 per cent. Lamps and lanterns, 20 per cent.

Lamps, arc, 10 per cent.

Globes, shades, chimneys, glass or metal, 20 per cent.

Telephones, free.

Electrical apparatus for surgeons' use, free.

Electric batteries and motors for dentists' use, 10 per cent.

Electric bell fittings (except cells for batteries, 10 per cent.), 20 per cent.

Electric pens and duplicating presses, 20 per cent.

Earthen and stone ware, china and porcelain, 20 per cent.

Copper wire, free.

NORTHERN TERRITORY OF SOUTH AUSTRALIA.

Telephones, free.

Gas and portable engines, free.

Other engines and parts, 15 per cent.

Bells, lamps and lampware, 15 per cent.

Copper wire, free.

Other, 10 per cent.

QUEENSLAND.

Electric machines, machinery and fittings, free.

Machinery for telegraphic purposes, free.

Gas and portable engines, free.

Copper wire, free.

Insulating materials, free.

Batteries, free.

Lamp globes, 15 per cent.

Other 25 per cent.

SOUTH AUSTRALIA (except Northern Territory).

Copper wire, free.

Batteries for telephones, telegraphs and medical use, free.

Batteries, other, 20 per cent.

Telephones, free.

Engines, portable and gas, free.

Other engines and parts thereof, 25 per cent.

Electric bells and bell indicators, 25 per cent.

Electric switches and cut-outs, 15 per cent.

Carbons for electric lighting, 15 per cent.
Other fittings or appliances unenumerated, 10 per cent.

STRAITS SETTLEMENTS.

All kinds, free.

TASMANIA.

Engines, engine fittings and electric machinery of all kinds, 10 per cent.

Electric light main cable, transformers connected therewith, and insulators for main cable, 10 per cent.

TRINIDAD AND TOBAGO.

Machinery free.

Other, 5 per cent. Goods for the use of the bureau for meteorological observations maintained in Port-of-Spain by the United States Government, free.

VICTORIA.

China ware, earthenware and porcelain, being telegraphic materials, free.

Globes and telegraph glassware, cut, embossed, etc., 2s. 6d. per cubic foot, including packing, measuring outside the package as imported.

The same, uncut, 1s. per cubic foot, including packing, measuring outside the package as imported.

Other glassware, 25 per cent.

Electric wire, covered or uncovered, free.

Electrical apparatus, free.

Electric fittings, viz.: arc lamps without globes, carbons, incandescent lamps, transmitters or transformers, and storage batteries, free.

Bell fittings, free.

Bells, 6 inches and under, free.

Lightning conductors, free.

Metal manufactures (including galleries for electric lamp sockets and for incandescent lamps, whether attached or not, electric staples and fittings for pipes and tubes) 30 per cent.

Electroliers, 30 per cent.

Machines and machinery for telegraphic purposes (but not including the motive power thereof), free.

Other machinery, including electric motors (except for dental purposes, free), 25 per cent.

Engines, other than portable, 30 per cent.

Portable engines, 15 per cent.

WESTERN AUSTRALIA.

Machinery, 5 per cent.

Parts of machinery, 10 per cent.

Electric batteries and meters 10 per cent.

Lamps and lampware, 10 per cent.

Other electric light material, electric bells (except for telegraphs and telephones), and cables, 5 per cent.

Earthen, glass, stone and china ware, not otherwise enumerated, 15 per cent.

Electric launches and electric bronzes (including lamps attached), 20 per cent.

Telegraph and telephone materials, including instruments, free.

Copper wire, and platinum wire and foil, free.

It should be borne in mind that in the tariffs of the several countries dealt with above there is no separate reference to electric machinery and apparatus. In such cases the rates of duty are given for those of articles with which the various kinds of electrical machinery and apparatus would probably be grouped, but it is not always certain how the tariff would be interpreted by the local customs authorities.

Meeting of the Electric Storage Battery Company.

The annual meeting of the Electric Storage Battery Company was held at Gloucester, N.J., on the 20th inst. The election for directors resulted as follows: P. A. B. Widener, W. L. Elkins, Daniel H. Shea, George A. Huhn, Thomas Regan, Herbert Lloyd, Thomas Dolan, W. W. Gibbs, Grant B. Schley, Issac L. Rice, George Philler, Rudolph Ellis, Joseph T. Sinnott, George H. Day, Phillip L. Dodge. There was no change in the board; 140,665 out of 160,000 shares were voted. The annual report made a favorable comparison with the two previous years. President Day stated that more than \$1,000,000 of unfilled orders were carried over on the books January 1, 1901. He said that there was money enough on hand to pay the next dividends, and that the prospects all pointed to the continuance of the dividend payments.

PERSONAL MENTION.

Engineers Deeley and Woolliscroft have been sent by the Midland Railway Company of London to this country to study American methods, including the adaptation of electricity to railroads.

Mr. Edwin Hanson, president of the Havana Electric Railway Company, who has been in Cuba for the last few weeks, recently returned to Montreal, Can., and expressed himself as perfectly well satisfied with the progress that has been made.

INCORPORATIONS.

The Soudnu Electric Company, El Paso, Tex. Capital stock, \$10,000.

The Astoria Electric Company, Astoria, Ore. Capital stock, \$900,000. Incorporators: Samuel F. Gordon, Frank R. Stokes and Charles H. Page.

The Union Township Electric Company, Elizabeth, N. J. Capital stock, \$2,000. Incorporators: John Kean, Hamilton Fish Kean, Julien H. Kean and others.

The People's Electric Light & Power Company, Kansas City, Mo. Capital stock, \$2,000. Incorporators: Hugh C. Ward, Charles E. Farley and Charles H. Rickert.

The Winstanley Electric Light, Power & Gas Company, East St. Louis, Ill. Capital stock, \$2,500. Incorporators: H. P. Taussig, W. W. Dean and Marc C. Gantier.

The Electrical Inspection & Maintenance Company, Pierre, S. D. Capital stock, \$250,000. Incorporators: J. H. Tomlinson, J. J. Post, Henry E. Leavitt and P. J. Knight.

The Electrical Appliance Company, Indianapolis, Ind. Capital stock, \$5,000. Directors: Elbridge E. Rines, Susan Rines, Christopher C. McCauley, Charles McCauley and John E. Booth.

The Southern Electric Company, El Paso, Tex.—to erect and repair electric light and power plants. Capital stock, \$10,000. Incorporators: D. L. Berkey, H. L. Lloyd and G. A. Andrews.

The Electro-Chemical Engraving Company, New York City. Capital stock, \$17,000. Directors: F. E. Switzer, Benjamin Woodruff and G. V. W. Switzer, all of New York City.

The Washington Power Company, Tacoma, Wash.—to deal in electric and hydraulic power and operate transportation lines. Capital stock, \$1,000,000. Trustees: J. L. McMurray, A. R. Warren, J. M. Ball and F. A. Rice.

The Hopewell Electric Light, Heat & Power Company, Trenton, N. J. Capital stock, \$100,000. Incorporators: Charles P. Fitch, Samuel H. Blackwell, Princeton, and Joseph B. Hill of Hopewell, N. J.

The J. B. Snyder Supply & Electric Company, Rochester, N. Y.—to deal in gas and electric fixtures. Capital stock, \$25,000. Directors: C. E. Snyder, W. C. Burnette and W. I. Peacock, all of Rochester.

The Consolidated Light & Power Company, Whitehall, N. Y.—to supply gas and electricity for light, heat and power purposes. Capital stock, \$75,000. Directors: Charles F. King, John H. Barker and Jere M. Cronin, all of Glens Falls.

The Consolidated Railway, Lighting & Refrigerating Company, Trenton, N. J.—to manufacture and supply electricity, gas, oil, compressed or liquid air to be used in connection with the lighting, heating, refrigerating ventilating and cleaning of railway cars and vehicles of all kinds. Capital stock, \$6,000,000. Incorporators: William C. Stemmerman, John H. Thompson, Jr., and Clifford W. Perkins.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 19, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

670,145. Electric Switch. William F. Bossert, Utica, N. Y., assignor to the Bossert Electric Construction Company, same place. Filed June 7, 1900.

670,319. Underground Current-Supply for Electric Railways. Hermann T. Hillischer, Vienna, Austria, Hungary. Filed Oct. 26, 1900.

670,375. Contact-Shoe-Lifting Apparatus for Electric Cars. Joseph S. Morison, Richmond Hill, N. Y., assignor of one-half to John F. Bjurlund, Borough of Queens, New York City. Filed April 20, 1900.

670,390. Current-Interrupter in Conducting-Rail-Contact Systems. John F. Bjurlund, Richmond, Hill, N. Y., assignor of one-half to Joseph S. Morison, same place. Filed Sept. 26, 1900.

670,382. Trolley-Wheel. John Caldwell, Providence, R. I., assignor of two-thirds to John S. Kellogg, same place. Filed June 9, 1899.

670,384. Trolley-Rope Holder. John W. Clayton, Denver, Col. Filed Nov. 1, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

670,149. Time Switch for Electric Circuits. Ethan I. Dodds, Avalon, Pa., assignor to George Westinghouse, Pittsburg, Pa. Filed Sept. 9, 1899.

670,316. Incandescent Lamp. Reginald A. Fessenden, Allegheny, Pa. Filed Nov. 27, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

670,059. Commutator-Brush Holder. William D. Pomeroy, Akron, O., assignor to the Akron Electrical Manufacturing Company, same place. Filed Sept. 22, 1900.

670,119. Brush-Holder for Electric Machines. John Trier Chicago, Ill., assignor, by mesne assignments, to Donald Grant, Faribault, Minn. Filed April 26, 1900.

670,138. Speed-Regulator for Explosive-Engines. Emile L. P. Mors, Paris, France, assignor to Societe Anonyme D'Electricite et D'Automobiles Mors, same place. Filed March 6, 1900.

670,174. Ammeter. Gustav Grabosch, Berlin, Germany, assignor to Gans & Goldschmidt, same place. Filed Oct. 12, 1900.

670,203-670,204. Apparatus for Controlling the Motion of Electrical Switches. William Kingland, London, Eng. Filed Aug. 9, 1900.

670,324. Dynamometer. Karl Leverkus, Charlottenburg, Germany. Filed Jan. 2, 1901.

670,363. Electrical Coupling or Terminal. William Walker, Jr., Birmingham, Eng. Filed Sept. 15, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

670,022. Intercommunicating Telephone System. Newman H. Holland, Brookline, Mass., assignor to the Holtzer, Cabot Electric Company, same place. Filed Nov. 12, 1900.

670,408. Signaling Apparatus for Telephone-Stations. Thomas W. Loaring, Cleveland, O., assignor to the Cuyahoga Telephone Company, same place. Filed Oct. 27, 1900.

MISCELLANEOUS.

669,999. Electric Signaling Apparatus. Adolf Mensing, Berlin, Germany. Filed May 25, 1900.

670,005. Electric Exercising-Machine. Nelson H. Raymond, Buffalo, N. Y., assignor to Albert W. Courtney, same place. Filed Aug. 14, 1900.

670,024. Process of Making Active Material for Accumulator Plates. Ernst W. Jungner, Stockholm, Sweden. Filed May 12, 1900.

670,026. Electric Cigar-Lighter. Alfred B. Kittson, Boston, Mass. Filed Oct. 24, 1900.

670,062. Coin-Freed Apparatus for Gramophones. Belford G. Royal, London, Eng., assignor to the Gramophone Company, Limited, same place. Filed Nov. 13, 1899.

670,121. Running-Gear for Automobiles. William Van Wagoner, Syracuse, N. Y., assignor to the Century Motor Vehicle Company, same place. Filed April 2, 1900.

670,142. Electrolytic Current-Interrupter. Arthur Wehnelt, Charlottenburg, Germany. Filed May 16, 1899.

670,172. Electric Water-Heater. Waldo F. Follett, New Haven, Conn. Filed Dec. 10, 1900.

670,189. Starting Mechanism for Automobiles. Henry Wilcke, Detroit, Mich., assignor of one-half to John Arthur Robinson, Armley, Eng. Filed Aug. 30, 1900.

670,201. Process of Producing Zinc Oxide and Nitrites. Edward D. Kendall, Brooklyn, N. Y., assignor of one-half to Ferdinand F. Cimiotti, New York City. Filed Oct. 11, 1900.

670,252. Igniting-Device. Ernest Schmidt, Wilmersdorf, Germany. Filed Jan. 19, 1900.

670,274. Switch for Suspended Electric Conductors. John Floyd, Washington, D. C. Filed Feb. 2, 1900.

THE TELEPHONE WORLD.

Progress of the Independent Telephone System.

George W. Beers of the Telephone, Telegraph & Cable Company of America, who has been West superintending the development of that company's many properties, has returned to this city. Mr. Beers is optimistic on the independent telephone movement outlook. He says the most important news in the independent situation is the recent Berliner decision, which has put every one at rest as to the absolute security of his independent telephone investments.

"I think the movement will get a fresh growth from the Berliner decision," he said recently. "In communities where there has been no independent telephone system franchises are now sought, and it will not be long before the systems are in operation. Probably the best instance of this is found at Dayton, O., where there has been no independent telephone system, although in almost every other city in Ohio a strong independent company is in operation. I understand that a franchise has been secured from the municipal authorities and active work will soon begin there."

Articles of incorporation have been filed by Charles Church, H. L. Frye and Phoebe Church, who have formed themselves into a company to be known as the Northfield, Minn., Telephone Exchange Company. The articles state that it is the purpose of the company to construct and operate telephone lines and exchanges, and that Northfield will be the principal place of business. The capital stock amounts to \$15,000. The highest amount of indebtedness or liability to which the company will be liable is limited to \$10,000. The board of directors consists of the first-named persons, who hold office until the first annual meeting or until their successors are elected and qualified.

The Southern New England Telephone Company is about to install in the large cities of the State of Connecticut, a new battery system, by which the use of a call bell is done away with, the subscriber having merely to take the ear piece off the hook. This and other improvements contemplated will involve an expenditure of \$250,000, it is announced, and the other improvements include the erection of an addition to the company's building in New Haven and a new building in Bridgeport.

A. W. Huggins, of London, Ky., has secured the right of way to build a telephone line from there to Manchester, and is organizing a stock company for that purpose. As soon as the line is completed to Manchester he will extend it to Hyden and on to Hazard. This line will be of great value to the merchants of Louisville and Lexington, as these two cities will be put in direct telephonic communication with the merchants of Clay, Perry and Letcher Counties.

The Home Telephone Company, Elkhart, Ind., has been compelled to order a new switchboard as the present capacity of 600 has been exceeded by over 30 orders. The company under the present management now furnishes one of the most efficient independent telephone services in the country. The independent companies are fast forming a perfect system.

A short time ago the Connecticut Telephone & Electric Company of Meriden, Conn., received a Government order for one hundred telephones for the War Department. The work has been completed and the 'phones shipped; they will be sent to Cuba to be used mostly in Havana and other cities. The telephones are equipped with all the latest patents.

The Chesapeake Telephone Company of Williamsburg, Va., has completed its connection with Yorktown of that State, and will be ready shortly to give long distance service to its subscribers.

The Bell Telephone Company will begin in a short time to considerably enlarge its underground wire system in the northern section of Trenton, N. J.

The Mansfield, O., Telephone Company has purchased the Star Telephone Company's lines in Richland County and a telephone war is on.

The Franklin County Telephone Company has petitioned the selectmen of Swanton, Vt., for a franchise to establish a local exchange in that town.

The total wire mileage construction of the Erie telephone system last year was 98,934 miles, of which 45,957 miles were underground.

The Virginia, Ill., & Little Indian Telephone Company has increased its capital stock from \$400 to \$5,000.

Southern States 'Phone Improvements.

The Southern States Telephone Company, a Maryland corporation operating exchanges in Norfolk, Portsmouth and Berkley, Va., filed a mortgage in Norfolk, March 20, to the Fidelity & Deposit Company of Baltimore to secure a bond issue of \$150,000. Of this \$50,000 will be used in retiring a previous bond issue and \$100,000 in improving and extending the company's lines thereabouts. It is understood that the connection by long distance wires of many towns south of York, Pa., is proceeding, and that the Southern States Company, of which Seymour Mandelbaum, of Baltimore, is president, will shortly be in active competition with the Bell Company in long-distance telephones as well as locally.

The Northwestern Telephone Exchange Company of Minneapolis, Minn., expects to begin its improvements early in May. Superintendent Wainman says: "As soon as the frost is out of the ground we will begin the work of increasing and improving our facilities. This means the laying of more wires and the construction of more cables and conduits. The East Side station will be occupied as early in the spring as possible. We expect that the trouble with the city over permits for laying underground and overhead wires will be settled amicably in a short time and as soon as the weather and ground permit we will get to work. These new facilities will enable us, when completed, to accept more subscribers for the lower classes of service, such as the nickel-in-the-slot and four party lines." The Northwestern does not contemplate any toll line extensions in Minnesota to speak of. Several short lines in North Dakota will be built and possibly an extension from Larimore to Devil's Lake.

The independent telephone companies in Iowa are endeavoring to get protection from the State through legislation against the warfare made by the Bell companies upon local independent companies. At the meeting of the Iowa Telephone Association a resolution was passed to ask for legislation to prevent the slashing of rates. It asks for a law making it illegal for a telephone company to make a lower rate in one city or town than in another and to compel uniformity in rates. It is claimed the Bell Company drives out opposition by cutting rates and independent companies cannot exist, thus competition is destroyed.

The Oil Belt Telephone Company is making arrangements to put in a telephone exchange at Bloomdale, O., and connect with the long-distance toll lines of the United States Telephone Company at Bowling Green, O. This exchange will furnish 'phones for the oil fields within three miles from Bowling Green. This company will be in competition with the Central Union Telephone Company, which now has an exchange established at the latter place with 60 'phones on the list.

Although there have been reports regarding the inactivity of the Knickerbocker Telephone & Telegraph Company in New York City, it was learned last week that constructive work is being pushed forward in the upper part of the city and toward Yonkers. President Eckert said recently that while the work was somewhat slow, still progress was made. But very little line work is now constructed in Brooklyn, as the company is centering its efforts in the Bronx.

The Mississippi Valley Telephone Company has lately been reorganized, and is to be called the Twin City Telephone Company; the number of directors is changed from five to seven. Large amounts of money will be spent in improving and enlarging the plant in Minneapolis and St. Paul, Minn.

According to news from Charlotte, N. C., the Curtis syndicate of Newark, N. J., represented by Mr. J. B. Curtis, has purchased the plant of the Queen City Telephone Company at a receiver's sale for \$23,000, the plant having cost between \$40,000 and \$50,000.

The Bell Telephone Company stockholders will again vote on an increase in the capital stock. A special meeting is called for May 21. The proposed increase is \$2,000,000, making the total outstanding \$8,000,000.

A charter was issued by the Pennsylvania State Department last week to the Southern Telephone & Telegraph Company of Kirkwood, Lancaster County. The capital stock is \$10,000.

The Dirigo Telephone Company of Maine is now operating in Dixfield, and already has six wires working.

The Adel, Ga., Telephone Company has made application for a charter.

Toronto Opposes an Advance in 'Phone Rates.

The corporation of the city of Toronto petitions the Government to enforce the clause in the act of 1893 providing that existing rates should not be increased by the Bell Telephone Company without the consent of the Governor-General-in-council; also, that the company be obliged to supply telephones to all persons who require and are willing to pay for the same.

Since the independent telephone company, which sought a franchise in Rockford, Ill., some time ago was turned down in favor of the Central Union Company, there has been a marked reversal of sentiment and it is an evident fact that should another well backed concern seek to gain a franchise it would be able to do so with little difficulty. The fact, says an Illinois paper, that the supervisors, a proverbially conservative body, have granted a franchise to the independent company for rural 'phones shows the tendency of the tide in that city.

The Independent Telephone Company, of Lebanon, Ind., has granted the co-operative people free service. The franchise that forbids the consolidation of the two Thorntown companies will be adjusted at the first meeting of the town council. Patrons of the Lebanon company now have free communication with Thorntown, Jamestown, Zionsville, Whitestown, Advance, Ind., and other points.

News from Wheeling, W. Va., states that a telephone war between the Bell Company and the National, a new company, composed almost exclusively of local people, is scheduled to begin April 1. The Bell people are charging \$100 a year for business telephones and \$50 a year for residences. The National has placed its rates at \$35 a year for business 'phones and \$18 a year for residences.

A petition is being circulated in Watertown, N. Y., and largely signed by patrons of both local telephone lines, the Bell and the Citizens', by which the signers bind themselves to a concerted effort to bring about the consolidation of the systems or the elimination of one of them.

George E. McGarland, of Davenport, superintendent of the Iowa Telephone Company, was in Sioux City recently completing arrangements for work to begin on the copper circuit toll line between Sioux City and Des Moines. The improvement will cost \$50,000.

The Scott County Telephone Company in Kentucky has absorbed two of the others and a plant with 200 drops will be immediately installed at Scottsburg. This leaves the fight between the Cumberland and the new company.

The Southwestern Telephone & Telegraph Company is making rapid progress in putting in its local exchange at Hempstead, Tex. In a few weeks it will have everything running in smooth order.

Fairmount & Matthews of Indianapolis, Ind., have organized an independent telephone company, with R. C. Nottingham president, and will put in twenty-five instruments.

A number of farmers living between Colfax and Almota, Wash., are putting in a barbed wire telephone line, using the barbed wire fences on their farms for this purpose.

The Western Union Telegraph Company, and the Gonzales Telephone Company of Gonzales, Tex., are receiving quantities of cedar poles to repair and extend their lines.

A telephone line is to be established from Mt. Olivet in Piqua, Ky., a distance of five miles, an enterprise much needed.

A movement is on foot to establish another telephone exchange in Greenville, Tenn.

The Delta, O., Home Telephone Company has increased its capital stock from \$10,000 to \$20,000.

TELEPHONE INCORPORATIONS.

The New England Wireless Telegraph & Telephone Company, Pierre, S. D. Capital stock, \$5,000,000. Incorporators: Francis H. Banks, Thomas B. Bishop and Leroy C. Smith.

The Terrace City Telephone Company, Kansas City, Mo.—to do business in Kansas City, Mo., and Kansas City, Kan., Capital stock, \$500. Incorporators: Hugh C. Ward, Fred. Huttig and Ferd. Heim.

The Livonia Telephone Company, Livonia, N. Y. Capital stock, \$1,000. Directors: E. A. Bronson, C. E. Hartson and W. B. Thurston, all of Livonia.

GENERAL ELECTRICAL NEWS.

Lighting.

Aurora, Neb.—The question whether the city will purchase the present electric light plant, enlarge it, and operate it, etc., will be submitted to the voters this spring.

Bellaire, Mich.—The new village council is in favor of erecting an electric light plant.

Bloomfield, Ind.—The town trustees have awarded a franchise for electric lighting and power to E. H. Dugger and J. E. Meredith to be completed before December 1.

Burnside, Ky.—The Burnside Electric Light & Power Company recently filed articles of incorporation. The capital stock is \$4,500. Ralph McCrackin is interested in the concern.

Cambridge, Mass.—The Cambridge Electric Light Company proposes to erect a new electric light station, at a cost of about \$250,000, which will be one of the finest in the country. The proposed plant will have 10,000 horse-power, supplying a current for more than 100,000 lamps.

Clyde, N. Y.—The electric department of the Clyde Gas & Electric plant was ruined by fire March 21. The plant is owned by Edward M. Moir of Marcellus. The loss is \$10,000, fully insured.

Coleman, Tex.—A. L. Dickinson is preparing to erect an electric light plant here.

Colfax, Wash.—New engines and boilers are to be installed at the Coad & Mackenzie electric light plant by July 10.

Creighton, Neb.—A stock company is to be organized here for the purpose of putting in an electric light and steam heating plant.

Elk Point, S. D.—An election will be held next month to vote on the question of erecting an electric light plant here.

Frenchtown, N. J.—This borough has passed an ordinance giving J. Hyde of Trenton the right to construct and operate an electric light plant.

Georgetown, Del.—An election will be held for the purpose of voting on the question of issuing bonds for an electric light plant.

Harbor Springs, Mich.—The proposition to bond the village for \$10,000 to extend the electric light plant of this village was lately passed.

Kearney, Neb.—Col. Blees of Macon, Mo., owner of the Kearney electric light plant, contemplates the enlargement and improvement of the plant.

Prescott, Wis.—H. C. Mercord, proprietor of the Prescott electric light plant, is preparing to enlarge and remodel his plant.

Statesboro, Ga.—The establishment of an electric light plant here is talked of.

St. Louis, Mich.—The city council has decided to submit a proposition to the voters at the coming election to bond the city for \$8,000 to improve the electric light plant and waterworks system.

Tifton, Ga.—The mayor will soon advertise for bids for lighting the town by electricity.

Stonington, Ill.—An electric light plant will soon be built here.

Terre Haute, Ind.—The Southern Indiana Railway Company will install a complete electric light plant in its new round house.

Washington, D. C.—The Treasury Department has signed a contract with Frederick Pierce of New York for installing the electrical apparatus in the various immigration buildings at Ellis Island. The contract involves the expenditure of \$25,000.

Willimantic, Conn.—Corporation Counsel W. A. King states that the Gas & Electric Light Company has decided to improve its plant in this city, and will expend from \$50,000 to \$80,000 on it.

Street Railways.

Alton, Mo.—An electric railway from here to St. Louis is said to be projected by the Eastern capitalists who financed the Alton Railway, Gas & Electric Company.

Altoona, Pa.—The City Passenger & Logan Valley Electric Railway interests have again changed hands.

Bloomington, N. Y.—Paul Smith and Wallace Murray have secured options on certain water powers in the Adirondacks, including Franklin Falls, Wellington Notch, Hull's Falls and Saranac Lake, and propose to establish a trolley line in that region. It is planned to run the road from here to Saranac Lake, thence to Lake Placid, eastward to the Keene Valley and down the Au Sable Valley to Keeseville. Such a route would be more than 30 miles long.

Charleston, S. C.—The Charleston Suburban & Summerville Railway Company has been incorporated to construct an electric railway between this city and Summerville, a distance of 28 miles. The capital stock is \$600,000, and the directors are J. J. O'Connell, B. P. Evans and J. W. Simons.

Galion, O.—A franchise has been granted to F. D. Carpenter and S. N. Coe of Cleveland by the county commissioners of Crawford County for an electric line from this place to Crestline.

Girardville, Pa.—The Schuylkill Traction Company has authorized a mortgage for \$2,000,000 for extensions to Pottsville, Hazleton and Tamaqua.

Grand Rapids, Mich.—The officials of the Grand Rapids, Spring Lake & Grand Haven Electric Railway Company, after consulting with a representative of a New York financial house, decided to float a bond issue to the amount of \$4,000,000 with a view to constructing the road.

Harvey's Lake, Pa.—This place is to have a new electric railroad. A number of well known capitalists of Wilkes-Barre recently obtained a charter, secured the right of way and work will begin soon.

Huntsville, Mo.—There is talk of an electric line between here and Moberly.

Natchez, Miss.—G. Ross of Chicago, S. A. Duncan of Atlanta, and J. Z. George of Vicksburg, have been in this city making a preliminary survey with a view to putting in an electric street railway system.

Paulding, O.—S. S. Shisler and other business men of this place are agitating the building of an electric railroad from Continental, taking in all the towns to Latty, thence to Paulding and terminate at Antwerp. It is proposed that a stock company of Paulding County men be organized for this purpose.

Port Chester, N. Y.—The authorities of this place have granted a franchise to the Port Chester Street Railway to extend its trolley lines across the Byram River bridge, which connects this State with Connecticut.

Redwood, N. Y.—The proposed trolley line between here and Alexandria Bay is again being talked of.

Tampa, Fla.—The Tampa Electric Company is preparing to spend thousands of dollars in the further completion of its street railway service.

Wausau, Wis.—The Wisconsin River Valley Electric Railway Company will build and equip an electric street railway to connect this place and Merrill, and in time the line will be extended south to Nekoosa and north to Eagle River. T. F. Frawley, C. T. Bundy and R. P. Wilcox are interested in the enterprise.

Windsor, Ont.—The bill of incorporation of the Windsor, Essex & Lake Shore Railway has been passed. Electricity is named as the motive power. The road will run from this place to Wheatley and is capitalized at \$5,000,000.

Manufacturing.

New York City.—The United Telpherago Company, capitalized at \$1,500,000, has lately been formed to manufacture telpherago devices, vehicles, etc. Among those interested are Charles M. Clark, New Jersey; Henry McL. Harding, and H. H. Tyndale New York, and Walter T. Wallace, Glen Ridge, N. J.—Patrick J. Kennedy, John J. Quigley and K. K. McLaren are the promoters of the Thomas Hoey Supply & Manufacturing Company; capitalized with \$200,000; to manufacture electrical supplies.

Niles, O.—The Wiswell-Pritchard Electric Manufacturing Company is the name of the concern formed here to manufacture electric lamps and transformers. W. H. and P. J. Pritchard, F. W. Stillwagon, H. W.

Wiswell and C. M. Wilkins comprise the firm, which is capitalized at \$30,000.

Rochester, N. Y.—The Crescent Electrical Manufacturing Company of this city was lately organized with \$2,000 capital stock. C. R. Elliott, A. L. W. Miller and H. W. Russell are the directors.

Tacoma, Wash.—The Manufacturers' Railway Company has been incorporated by Everett G. Griggs, George J. Osgood, W. W. Lytle and John B. Hardy for the purpose of building street railways, suburban and other railroads, and to operate them with steam, electric current or other motive power.

Toledo, O.—Joseph L. Yost has acquired possession of the Dickson electric keysocket patent and will put it on the market, also a general line of electrical supplies will be manufactured in connection with the socket.

Company Matters.

Menomonee, Wis.—The Menomonee Submerged Motor Company has increased its capital stock to \$100,000 and elected the following officers: President, James H. Stout, Menomonee; vice-president, T. B. Hatch, Chicago; secretary and treasurer, John Haggood, of this city.

New Bedford, Mass.—At the recent annual meeting of the W. S. Hill Electric Company the treasurer's report showed the company to be in a prosperous condition.

Power and Transmission.

Albany, N. Y.—Last week a bill was introduced in the Assembly for the organization of the Lower River Power Company of Niagara, a rival of the present power company, and which starts with the avowed purpose of supplying electric power and water for New York City, through lines to be constructed along the Erie Canal. The capital stock is to be \$5,000,000. Commodore P. Vedder, Tunis G. Bergen, William Williams, Charles E. Hotchkiss and Dewitt V. D. Reilly, of New York; Patrick F. King, George W. Knox and James S. Simmons, of Niagara Falls, are back of the scheme.

Belvidere, N. J.—There is much talk of damming the Delaware River so as to get power for use in all the neighboring towns. The Delaware Power Company has been organized with a capital of \$200,000, and it is said will push the work as soon as spring opens.

Fayetteville, N. C.—The Cape Fear Electric Power Company proposes to generate the electric power at Buckhorn for transmission to this city. Mr. Gray, of this city, is one of the promoters of the enterprise.

Nashville, Tenn.—The charter of the Great Falls Power Company of Davidson County was registered a short time ago. The company is capitalized at \$20,000, and proposes to utilize the power at the falls to generate electricity and convey it to this city to be used for light and power. Thomas G. Kittrell, George Jungermann, R. D. Goodlett, Arthur J. Dyer and Wm. O. Vertrees are the promoters of the scheme.

Mines.

Boulder, Col.—An electro-chlorination mill is soon to be built at Wall Street Camp at a cost of \$125,000.

Leadville, Col.—Work on the construction of the electric power plant at Homestake Creek, Eagle County, which is to be built by the Leadville Electric Power Company will soon be commenced. The company expects to generate not less than 10,000 hp. and will be prepared to equip a system that will embrace all the mines of the Arkansas Valley as far south as Buena Vista.

Automobiles.

Joplin, Mo.—Reynolds, Graves & Co., are now in their new building, which was erected especially for the manufacture of automobiles. It is complete in every respect.

Toledo, O.—An automobile system to Ottawa Park is one of the projects of this coming season.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 16¼@16½c.; casting, 16½@16¾c.

The Rio Plate Electric Company of Philadelphia has increased its capital from \$100,000 to \$500,000.

The Metropolitan Street Railway directors have declared the regular 1½ per cent. quarterly dividend.

The Philadelphia Bell Telephone Company's capital stock has been increased from \$6,000,000 to \$8,000,000.

The Union Light, Heat and Power Company, of Covington, Ky., has been incorporated with \$1,500,000 capital.

The Consolidated Railway, Lighting and Refrigerating Company, capital, \$6,000,000, has been incorporated in New Jersey.

The Madison (N. Y.) Gas and Electric Company's annual meeting will be held April 17. Books close March 27 and reopen April 18.

Business failures in the United States last week numbered 224, against 183 the same week last year; in Canada there were 33, against 27 last year.

For February the Brooklyn Rapid Transit Company earned gross, \$843,394, and net \$258,932, gains, respectively compared with the like period last year, of \$26,112 and \$41,917.

The Montreal Heat, Light and Power Company is said to be organizing all the power, gas and electric companies in Montreal into a combination, with \$25,000,000 capital.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 5@5½; Electric Boat, 24@26; Electric Vehicle, 14@16.

The stock of Electric Lead Reduction is again an active feature of the outside market. The company announces that it is doing a very large business since the opening of its new plant at Niagara Falls.

Bell Telephone Company stockholders will again vote on an increase in the capital stock. A special meeting is called for May 21, the proposed increase being \$2,000,000, making the total outstanding \$8,000,000.

The Detroit, Ypsilanti, Ann Arbor & Jackson Electric Railway will give a mortgage on its property to the Detroit Trust Company for \$2,000,000 to secure bonds to pay for the extension from Ann Arbor to Jackson.

The Street Railway & Illuminating Properties of Boston has made a distribution of \$1 a share on its common stock. Including this recent payment the company has distributed \$6 on the common stock since January 1, 1901.

The committee on securities of the Baltimore Stock Exchange has recommended the listing of \$2,838,000 additional consolidated 4 per cent. bonds of the United Railways & Electric Company, making the total amount listed to date \$25,231,000.

The directors of the Erie Telephone Company at their meeting on March 25, in Boston, deferred dividend action pending the examination of the company's books by the Eastern Audit Company. Three months ago a regular quarterly dividend of 1½ per cent. was declared.

The Consolidated Traction Company of Pittsburg reports for February: Gross earnings, \$205,432; increased, \$10,603; net earnings, \$98,321; increased, \$8,340. From April 1 to February 28: Gross earnings, \$2,650,959; increased, \$254,331; net earnings, \$1,423,565; increased, \$210,601.

A resolution has been passed by the members of the New York Stock Exchange requesting the Government Committee to close the Exchange on Good Friday and the Saturday following. The Governors will probably take action in the matter to-day. It is believed they will grant the request.

Notices were issued Saturday for the annual meeting of the Electric Company of America to be held April 23. It is said that the profits of the year's business show about \$410,000. The year's dividend, \$1 per share, is on nearly 400,000 shares outstanding and the surplus over the dividend in 1900 is understood to be about \$20,000.

At a special meeting of stockholders of the Worcester Traction Company of Massachusetts, held on the 22d inst. at the office of Thomas C. Barr, 196 Market street, Newark, N. J., the representatives of \$3,834,000 out of a total of 5,000,000 shares voted to ratify a contract of sale entered into by the board of directors with Vermilye & Co., of New York. By this ratification the sale goes into effect at once. The price paid is kept secret.

Application has been made to list the stocks of the Canadian General Electric Company on the Montreal Stock Exchange. The capitalization of the company is \$1,500,000, of which \$300,000 is preferred, paying 6 per cent. interest. The common stock pays 10 per cent. per annum and the closing quotation in Toronto a few days ago, and where the stock has been active for some time, was 210¼. The capitalization will be increased to \$2,000,000. Last year the company paid out in dividends \$127,623.

Plans for the consolidation of the Boston electric lighting companies, which have been kept in abeyance since the failure of the effort of J. P. Morgan & Co., to effect a combination by the formation of a new company which was to absorb the Boston Electric Light Company and the Edison Electric Illuminating Company, are now maturing. As far as they extend at present, the plans contemplate a consolidation in which the stock of the Edison Company will be used as a basis for valuation. No outside capital will be required and the anti-trust statute will be complied with. It is expected that the gas and electric light commissioners will approve the terms of the consolidation and an additional issue of stock for the new corporation.

ELECTRICITY.

VOL. XX.

NEW YORK, APRIL 3, 1901.

NO. 18.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES,	\$2.50
IN CLUBS OF FIVE OR MORE,	2.00
FOREIGN COUNTRIES,	4.00
SINGLE COPIES,	10 cents

Remit by Express, Money Order, Draft, Post Office Order or Registered Letter.

ADVERTISING RATES.

As *ELECTRICITY* reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application. Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

The Office of Commissioner of Patents.

The appointment of Mr. Fred. J. Allen as Commissioner of Patents in place of Charles H. Duell has caused the independent telephone men to rise up in arms, and it would seem justly so. Mr. Allen is from Auburn, N. Y., and is a director of the Empire Telephone Company of that city, which is a Bell Company, and it is a well-known fact that the Bell Telephone people have long wanted a man in the Patent Office who understands the telephone business, and who is friendly to them. Such being the case, is it any wonder that the independent companies do not approve of the present state of affairs, especially in view of the fact that the Bell Telephone Company has numerous complicated patent claims pending, and about to come before the Patent Office. Mr. S. P. Sheerin, Secretary of the Independent Telephone Association of the United States, declared recently that the members of the association and all others interested in independent telephone extension will protest against the appointment. He stated that the independent companies had no candidate, but they hold that they have a right to insist that a fair and impartial man shall get the place.

It is understood to be the intention of the Independent Telephone Association to ask the President to withdraw the appointment, and if this is not done, the gentlemen interested will fight confirmation in the Senate. In view of the facts of the case it is to be hoped that President McKinley will reconsider his decision and ultimately appoint some one in no way interested in the telephone warfare now being waged.

Compressed Air Cars.

The authorities of New York City are very particular as to the storing of acetylene, dynamite or other explosives within the city limits, and yet it sees no harm in a system of street railway propulsion, each car of which is a veritable charged mine in itself. Early on the morning of March 27 the tank on one of the compressed air cars on the Twenty-eighth street cross town line exploded, scattering bolts, rivets, scraps of iron and glass in every direction. That no one was seriously injured or killed outright was due to

the early hour and to the fact that the car had completed its trip and was about to enter the power house.

The cause of the accident is stated to have been due to a small steam pipe running through the heater. This pipe, which passes along the bottom of the heater, to which it is secured by studs, carries live steam which heats the water. This small steam pipe worked loose from the studs, and in the course of time wore the bottom of the heater thin by its continual chafing and grinding. This naturally weakened the wall of the heater, which eventually gave way, causing the explosion.

As repeatedly urged in these columns it is time this system of street railway propulsion was done away with in this city. The system in itself is bad enough, filling the streets as it does with a long line of grease and noise, and if added to this the tanks on the cars are going to explode occasionally, the sooner the Metropolitan Street Railway Company substitutes electricity the better. It is safe to say that had the compressed air tank on the car referred to exploded during the hours of heavy traffic there would have resulted many serious injuries if not loss of life. Why the Metropolitan Company persists in experimenting with this system of propulsion is difficult to see, for in an editorial some time ago we pointed out that the saving in operating expenses between the underground trolley system and the compressed air system would furnish ample funds to pay the interest on an amount of money sufficient for the construction of the conduit. Compressed air cars may be well adapted to suburban use, but they certainly do not meet with the approval of the public in this city.

* * *

The Manhattan-Staten Island Transit Scheme.

The Rapid Transit Commission, the latter part of last week, rejected Mr. Albert L. Johnson's proposal to construct a tunnel railroad from Manhattan through South Brooklyn and Staten Island to the New Jersey line, to be operated on a three cent fare basis. The ground on which the proposition was rejected was that it was too vague. It therefore seems reasonable to suppose that the matter will be brought up again on a different basis.

The interest in Mr. Johnson's proposed enterprise attaches to the three cent fares. He claims he can make money by hauling people at that price because there will be no water in

the stock of his road. That there is something in this is apparent to every one who has a knowledge of street railway finances and it is well known that the stocks of a corporation, which have no real value, must earn as much money as those which represent good dollars invested. As a daily paper puts it, "were it not for the liquid nature of so much corporate value, three cent fares would now be in vogue."

One cannot help but admire the enterprise and push of the two Johnsons. They have promoted, built and operated a number of street railways, not so much in the interest of the public, however, as in their own interests. The scheme now suggested eclipses anything heretofore accomplished by the two enterprising brothers, and is certainly a mammoth undertaking, and it therefore behooves the Rapid Transit Commission to look carefully into every detail, or in other words, make haste slowly. That the city needs rapid transit tunnels under the East River, and to Staten Island for that matter, is only too apparent, as was pointed out in a recent editorial, and unquestionably a three cent fare would be welcomed, but the Rapid Transit Commission should see that the city's interests are safeguarded in every way.

* * *

The Effect of X-Rays Upon Air. Prof. Emilio Villari has just discoursed before the Physical Society in London on "How Air Subjected to X-Rays Loses its Discharging Property and How it Discharges Electricity." He showed that air made active by X-rays in passing through a long tube coiled in many turns loses much more of its discharging power than it does in passing through the same tube if straight. During this process the tube charges itself to a certain potential. If active air is allowed to stream on masses of wire gauze or wound up ribbons, inclosed in tubes, the metals, independent of their nature, take a positive or negative charge according to whether the active air rubs against them with force or lightly. Experiments have been performed to prove this. For instance, tubes of copper or lead, if short and straight, take negative charges, but if long and coiled, they take positive charges. These phenomena cannot be attributed to chemical actions, but seem to be produced by a special rubbing to the active air upon metallic surfaces, as the result of which they assume one of the charges, and the other charge ought to manifest itself in the air. This is not the case, the charge of the air being often of the same kind as that of the metals. It has previously been shown by the author that active air by streaming against an electrified body is reduced either to ordinary air or to air charged with the electricity which disappears. Hence it may be supposed that the active air in rubbing upon the metallic surfaces develops the two electricities, one of which manifests itself upon these surfaces, and the other goes to reduce the active air to ordinary air and therefore does not become manifest. The electro-scope used in the experiments consisted of a fixed brass plate and a gold leaf whose position was determined by means of a telescope with an eye-piece scale.

Prof. Sylvanus P. Thompson, who presided, said that he had observed that metals were charged sometimes positively and sometimes negatively by active air.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

A CABLE dispatch states that Charles T. Yerkes has secured enough stock of the Metropolitan & District Underground Railway Company of London to prevent the installation of the Ganz high voltage motive system.

THE trouble between the employes and the Monongahela Street Railway Company of Pittsburg was amicably settled Saturday morning. The men passed resolutions, in which they agreed to drop all differences and blamed all their difficulty on outside interference.

LAST week the Supreme Court in the case of the State of Ohio vs. the Dayton Traction Company decided in favor of the traction company, affirming to such railway the right to carry freight through the streets of the municipalities along its lines.

FREDERICK J. ALLEN, of Auburn, N. Y., was sworn in as Commissioner of Patents on Saturday. After being sworn in Mr. Allen made the following statement: "The idea that I am in any way connected with the Bell Telephone Company is altogether without foundation. I am not now and never have been either an agent for or a stockholder in the Bell Telephone Company. I was at one time a stockholder and director of the Empire State Telephone Company, of Auburn, N. Y., which was a subsidiary branch of the Bell Company, but I have completely withdrawn from that concern. All my experience has been that stockholders and officers of these subsidiary companies are not likely to be friends of the Bell Company."

EXPERIMENTS with fast electric trains between Berlin and Hamburg, Germany, have demonstrated that a speed of at least 125 miles an hour can be attained without difficulty. Consul General Guenther, in Frankfurt, in a report to the State Department at Washington, on this subject, says that the high rate of speed has placed surface crossings out of the question. The outcome of the experiments is to be a line of 156 miles in length, from a point adjoining the city of Berlin to a station just outside of Hamburg. Its estimated cost is \$33,000,000.

EXPERIMENTS recently made abroad go to show that the insulating qualities of mica, which are used so extensively in electrical instruments, are materially affected by contact with oil. A sheet of mica spread over with a thin layer of oil loses about one-half its normal resistance to the passage of an electric current.

THE Ohio Independent Telephone Association will hold its annual meeting at the Chittenden Hotel, Columbus, on April 5. The principal object of the meeting, it is announced, will be to promote harmonious relations among the companies.

ACCORDING to official statistics, the United States now stands at the head of the world's exporting nations. The complete figures for the year 1900, when compared with the statistics of other nations, show that the exports of

domestic products were greater than those of any other country, the grand total being \$1,453,013,659. The total from the United Kingdom of Great Britain, which has hitherto led in the race for this distinction, is \$1,418,348,000, while the total for Germany is \$1,050,611,000.

NEARLY all of the street cars in Albany, Troy, Watervliet and Cohoes are now being operated by electricity generated by the Mechanicsville water power at the dam on the Hudson River. This is a great saving of expense over former methods.

DURING the past week the daily newspapers have contained sprightly articles about the latest incidents in the busy roles being daily enacted by Messrs. Nikola Tesla and Thomas A. Edison—but this time the movements of the gentlemen are outside the lines of pure science. The wonders wrought by a vegetarian diet induced Mr. Tesla to become a member of the Vegetarian Society of New York and he has written an article on the subject, an excerpt of which is as follows: "On general principles the raising of cattle as a means of providing food is objectionable. It is certainly preferable to raise vegetables, and I think, therefore, that vegetarianism is a commendable departure from the established barbarous habit." Mr. Edison, however, has been having real fun. A press dispatch from Fort Myers, Fla., states that on "Monday Mr. Edison went up the Caloosahatchie River with his family, chartering the steamer Suwanee. He caught forty-three black bass, the largest weighing eight pounds; killed a twelve-foot alligator; caught seven turtles and killed a quantity of duck, snipe, quail, wild turkey, white pelicans and kites. On Wednesday he went down the river, hooked three tarpon and caught eighty-seven fish. On Thursday a twenty-pound channel bass and a thirty-pound cavally, or snook amber jac, were among his large catch." Mr. Edison is due to arrive in New York to-day and will undoubtedly receive the plaudits of his friends for "his remarkable week's work."

At the recent meeting of the Council of the American Institute of Electrical Engineers the board selected the following ticket: President, Charles P. Steinmetz; vice-presidents, Samuel Sheldon, George F. Sever, M. I. Pupin; managers, J. W. Lieb, Jr., Samuel Reber, Charles F. Scott, W. E. Goldsborough; treasurer, George A. Hamilton; secretary, Ralph W. Pope. It was decided to raise the secretary's salary from \$2,500 to \$3,000 a year.

THE third annual meeting of the Southwestern Gas, Electric & Street Railway Association will be held at Houston, Tex., from April 19 to 22. The headquarters of the association are to be at the Rice Hotel. The usual reduction in railroad rates has been secured for members. Ten papers are to be presented at the meeting, as follows: "Municipal Ownership vs. Private Corporations," by T. D. Miller, of Dallas; "Association Between Meetings," by C. A. Newning, of Houston; "Station Work," by George Cushman, of San Antonio; "Corporations and Their Employes," by H. F. MacGregor, of Houston; "Street Railways of Texas," by F. E. Scovill, of Austin; "Inspection," by W. S. Rathell, of Waco; "Electrical Pot Pourri," by John G. Boyd, of Terrell; "What Are We Here For?" by E. L. Wells, of

Marshall; "Cheap Fuel and How to Use It Economically," by L. T. Fuller, of Colvert; "Water Power for Small Plants," by F. R. Starr, of Gonzales.

In a report to the State Department Consul General Guenther, at Frankfort, says: "It is reported that C. Petersen of Christiania has constructed a new incandescent lamp, which is of interest on account of its peculiar arrangement. For the radiation of light, a conductor of the second class, which conducts electricity only when heated, is used, the same as in the Nernst lamp. The conductor in this new lamp, however, is not a thread, but a small rod, which is brought to a white heat and thereby emits light. Around this 'second-class' conductor a thin metal wire of good conductivity is wound, which is connected with the current conductor by equalizing resistors, which serve the purpose of heating the second-class conductor and increasing the resistance of the current. The second-class conductor takes up the greater part of the current. This arrangement results in a great saving of the electric power, which about equals that of a Nernst lamp, but yields a considerably stronger light."

Americans interested in the promotion of English electric traction schemes will be glad to learn that the movement which has been set on foot for obtaining longer leases of lines from municipal authorities has borne good fruit, and the House of Commons has given its approval to the principle which allows a lease of something like 42 years instead of the much shorter periods with which promoters have had too often to be content. We may also add that there are signs that municipal opposition will not much longer be sufficient to throw out a scheme. Municipalities will have to sing small soon.

THE "Elektrotechnische Zeitschrift" for February 7 contains its yearly summary and full statistics of the electrically-driven tramways in Germany. On September 1, 1900, there were 99 towns having electric tramways against 88 on September 1, 1899. The total length of lines in the same time increased from 2,048 km. to 2,868 km., the length of track from 2,812 km. to 4,255 km., the number of motor cars from 4,504 to 5,991, the number of trailers from 3,138 to 3,962; the total capacity of generating plant from 52,509 kw. to 75,608 kw., and the total capacity of power house batteries from 13,532 kw. to 16,890 kw. Besides, at the commencement of September, 1900, 28 other towns had electric tramways in progress or definitely decided, with 821 km. of line and 1,053 km. of track. Of these 8 had been completed by January 1, 1901.

Those who are acquainted with what electrical science has achieved can form some idea of what it is still capable of accomplishing, says "Electrical Investments," London. The president of the Institute of Electrical Engineers, reminds us that "twenty years ago some of us were laughed at for our optimism, and yet everything that we declared then to be doable has now actually been done by engineers, except . . . the electric consumption of coal." But the industry has in this country been hampered by the solicitude which has been shown for local authorities, and they have exercised their power of veto in a way calculated to discourage private enterprise. The advance

made in recent years, since the adverse conditions have in a small degree been modified, has been wonderful. The capital invested in electrical undertakings exceeds £123,000,000, and of this nearly one-half represents lighting and traction investments made during the last ten years. At present new electrical investments are made at the rate of at least £10,000,000 per annum.

A CABLEGRAM from Port Said, Egypt, states that the Ophir, with the Duke and Duchess of Cornwall and York on board, arrived there on March 30. Mohammed Ali, brother of the Khedive, welcomed the English notables in the name of the Khedive. During the voyage the Ophir was almost constantly in touch with the shore by means of wireless telegraphy. On March 28 she sent a message to the Island of Malta, 185 miles distant, and passing 100 miles south of the Island of Crete, the Duke of Cornwall and York telegraphed to his cousin, Prince George of Greece, the Commissioner of the Powers on that island, and received a reply.

THE illumination of the Falls of the Rhine at Newhausen has for several years been a widely advertised attraction. It lasts for but a few minutes each evening and the effect of colored lights and searchlights is very beautiful. The guest of the hotel finds in his bill on departure a certain sum "for illumination of the falls." The Michigan Central Railroad, says the "Railway and Engineering Review," is proposing during the coming summer to illuminate Niagara Falls, which will afford a view of the greatest grandeur. A test recently made by officials of the passenger department with an electric searchlight convinced them that marvelous effects could be secured. Accordingly arrangements have been made for several similar searchlights to be erected on the high banks overlooking the falls from the Canadian side. The electric power is derived from the rapids, and the illumination will take place during the passage of all trains after nightfall. The most superb view will be from Falls View Station, where sufficient stops will always be made to allow the passengers to fully enjoy it. As no extra charge will be made this should prove a great attraction to travel by the M. C. Even those to whom the falls have become an old story, will find the night view a scene long to be remembered.

A RECENT German patent describes "the Dile apparatus" for the production of phosphorus by the action of a current on a mixture of phosphoric acid mixed intimately with one-fourth of its weight of carbon in the form of lamp black. The positive electrode is at the bottom of a covered cylindrical vessel, while the negative passes through a hole in the cover and can be lowered or raised by a screw. It is claimed that the apparatus will work continuously without the necessity of cleaning out the residue, as only carbonic acid, phosphorus and a small amount of light ash will be obtained, the raw material being introduced through a hopper at the top.

EXTENSIVE improvements have been made to the brickyard of Bartlett Brothers, just north of Hudson, N. Y. The most striking improvement will be the adoption of electricity as motive power. A twenty-five horse power motor for each machine has been ordered, a motor to pump the water from the river and an

electric locomotive with trolley is to be used on the tramway. This will do away with all horses on the yard and greatly facilitate the work. Ten arc lamps have been contracted for, and the yard will be lighted by electricity. This change will make it possible to load 150,000 brick a day, and will greatly aid in the productive power of the plant, which will be the only brickyard of its size in the country where the bricks are made by electricity. The power will be furnished by the Albany and Hudson Power Company, which operates the electric railway between those two places.

TOM JOHNSON, the "Trolley King," was elected Mayor of Cleveland, O., on Monday.

A SPECIAL cable from London, Eng., states that "Hon. William Mulock, Postmaster-General of Canada, gave evidence (on March 26) before the Inter-Departmental Cable Committee. The proceedings were private, but it is understood that Mr. Mulock favored the expansion of the state-owned cable system by the construction of a Government cable between Canada and Great Britain, also the acquisition of a line from Australia via Singapore and Hong Kong. The latter extension would be the greatest possible advantage to Canada, as thereby Canada would via a Pacific cable, be in direct communication with China and Japan, to the great advantage of Canadians seeking trade development in the Orient."

At Albany on April 1 Assemblyman Lynn explained the objects of his street railroad bill. He said: "It has no specific object. It is a bill with a general purpose, that purpose is to give electric railroad companies everywhere in the State an opportunity to compete with steam railroad companies. If the members from New York City are so afraid that the bill has some deep-laid purpose to acquire particular property in New York, they can leave New York city out of the bill. It will be just as acceptable to me with New York left out of it."

It is not in this country alone that the electrical industry is making remarkable strides. While the United States leads in this branch of business enterprise, others are following us closely. Great Britain, for example, has made a record which if it stood entirely alone would be fairly startling. It is only when it is brought into comparison with what has been done in the same direction here that it ceases to be wonderful. The capital invested in electrical enterprises in the United Kingdom, exclusive of the Government's telegraph and telephone systems, amounts in round numbers to over \$600,000,000. The increase in the last year has been over \$85,000,000, and in the last five years the amount invested has just doubled. These figures include the amount invested in plants used exclusively in the manufacture of electrical supplies. Another indication that progress will be still more rapid in the future is that there has been a very satisfactory reduction in the cost of production. The average cost of generation has decreased in five years nearly 50 per cent. The use of electricity is steadily growing in popular favor. In the last five years the number of 8 cp. lamps has increased from 2,000,000 to 7,660,000, and the units of light sold have increased from 30,000,000 to 125,000,000.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 21.

THE TELEPHONE AND TELEPHONE PRACTICE.

(Continued.)

The apparatus and circuits involved in the operation of telephones and central exchanges have undergone continual changes and improvements until at the present time the switchboards and circuits of up-to-date central offices have no resemblance to the ones used a few years ago. I will not attempt a description of all the different types of instruments and switchboards leading up to the present very complete common battery systems, but rather treat our series of articles on telephony under the following heads: Local Battery Systems, Line and Underground Construction, Common Battery Systems, Private and Interior Telephone Systems, Operation of Sub-Exchanges, Some Modern Circuits, and the Telephone Inspector.

LOCAL BATTERY SYSTEMS.

This is sometimes termed general system work and refers to the operation of instruments by separate batteries for each telephone. This was almost universally used, but at present is being gradually replaced by common battery or centralized energy systems.

FIG. 1.

The Blake transmitter, described in the previous article, makes a very satisfactory equipment for what is known as ground lines, that is, where the earth constitutes one-half of the entire circuit, but metallic circuit work has been replaced by the granular carbon transmitter, sometimes known as the, "solid back." The granular carbon transmitter, instead of having a contact which is varied in pressure, as in the Blake, has a cell of fine granulated carbon inclosed at the ends by two carbon disks, one of which is placed solid while the other may act as the diaphragm itself or is attached to a diaphragm. The vibrations vary the pressure with which the granules lie against each other and cause a great variation of resistance to a flow of current through the cell.

Fig. 1 illustrates a circuit of two local battery telephones, showing all the connections. Set A describes the connections for a wall telephone and set B the connections for a desk instrument. In this circuit the polarized bell and magneto generator for signaling is shown as bridged on the line, and this is the more common method of connection, although the generator and bell may be placed in series with the line and be arranged to be cut out of circuit by the automatic hook. This latter arrangement would be all right provided there were just two telephones on a circuit, but if a

number of instruments were placed on one circuit it would give very unsatisfactory results, as the line would be unbalanced in resistance and also all conversations carried on between telephones, having other stations in the circuit, would meet with the resistance and impedance of the bell coils, which would be a serious detriment. On account of this most all telephones are now manufactured to operate bridged, on a circuit, and have polarized bells wound from 500 to 1,000 ohms resistance.

FIG. 2.

There are a large number of granular carbon transmitters on the market, but a very satisfactory one can be constructed as described in Fig. 2. The diaphragm is of sheet aluminum, $2\frac{1}{2}$ inches in diameter and 1-32 of an inch thick, surrounded by a heavy rubber band, as described in the drawing. The cell consists of two polished carbon disks $1\frac{1}{2}$ inches in diameter and 1-16 of an inch thick, separated by a ring of soft vibratory material, such as felt, $\frac{1}{4}$ of an inch thick having an outside diameter of $1\frac{1}{2}$ inches and an inside diameter of $\frac{1}{2}$ of an inch, forming a cell $\frac{1}{2}$ of an inch in diameter and $\frac{1}{4}$ of an inch deep. This cell should be filled with granulated carbon about as fine as coarse granulated sugar. The carbon disks should be copper coated on one side to permit of their being soldered to proper supports, such as small brass buttons, so that the diaphragm may be attached, and also for the adjusting screw to rest against. By having a hollow in the brass button attached to the back disk, the adjusting screw will then act as a support for the cell. In forming the cell, the felt ring may be glued to one of the disks to hold it in place. Two cells of battery give good results in the operation of a transmitter such as just described.

FIG. 3.

The following are dimensions for an induction coil (Fig. 3.) to be used with granular carbon transmitters. In fact it is a standard and may be used with most any make of transmitter with satisfactory results in general system metallic circuit work: Entire length 3 inches with end blocks one inch square by $\frac{1}{4}$ of an inch thick. The core of soft iron wire to be 5-16 of

an inch in diameter and to be the entire length of the coil. The primary winding consists of three layers of No. 25 magnet wound wire, B. & S. gauge, and the secondary winding to be ten layers of No. 28 magnet wound wire, closely wound over the primary.

FIG. 4.

Any standard well made receiver may be used and they usually have from 75 to 80 ohms resistance in the coil. Apparatus, such as just described, if properly constructed, and adjusted, will make a good long distance telephone equipment, giving perfect results.

Fig. 4 described a circuit for a line connection to a central exchange showing the "jack" and "drop." This is the circuit almost invariably used except in multiple switchboards, where the line may be placed in series through all the jacks on its circuit or else the "drop" may remain permanently bridged across the circuit and a special restoring device used.

FIG. 5.

Fig. 5 shows a connecting cord circuit for a central switchboard, giving the circuit for ringing keys and listening key for the operator, also the clearing out signal sometimes called the "ring off drop." There may be any number of these cord circuits placed in a board by having the operator's listening circuit connected to all the listening keys. The operation consists of placing one "plug" in the jack of the station calling and placing the corresponding "plug" in the jack of the station called. When the subscribers are through talking they "ring off" which operates the drop X, indicating to the operator that the parties connected by that pair of cords have finished.

Article No. 22 will be entitled "The Telephone and Telephone Practice" (continued).

Gas Engines at High Altitudes.

Trouble with gas and gasoline engines working at high altitudes has prompted an item in the "Gas-Engine Magazine" to the effect that, as ordinarily sent out, such engines have air inlets too small and compression spaces too large for satisfactory work in a rarified atmosphere. In other words, when an engine is intended for high altitudes it should have a larger air-inlet and a smaller compression space than when the same engine is to work at sea level. It is hardly worth while to make these changes for altitudes of less than 5,000 feet, but for that altitude, and for those that exceed it, the engine should have a plate attached either to the piston or to the cylinder head in order to reduce the compression space. It should also be remembered that gasoline at high altitudes evaporates at a much lower temperature than at the sea level, and it would be well, therefore, to use the heavier grades.

WIRELESS TELEGRAPHY.*

BY PROF. DR. F. BRAUN.

During the winter I have delivered two lectures before Strassburg scientific societies on a part of my practical and scientific experiments in wireless telegraphy, and I take the liberty of giving a short account of the substance of these lectures. My experiments were commenced in the summer of 1898, and were at first devoted to methods of signaling through water in a more effective manner than hitherto. This, however, will be referred to on another occasion.

Following these, experiments on the Marconi system were undertaken with a view, in the first instance, to increase the action of the transmitter. At that time the general idea, and also Marconi's, was that he was working with Hertzian—i. e., with relatively short waves. In fact, the introduction of the Righi oscillator was manifestly with the intention of increasing the frequency of the waves as much as possible. One might be doubtful, however, to what extent this assumption was correct, for the question here was obviously to what distance the charge had already traveled in the transmitting wire connected to the Righi balls at the moment when the balls themselves are charged up to the sparking potential. If one takes the simpler connection with only one spark-gap the natural conception would be that the whole transmitter would be charged to practically constant potential owing to the slow charging process, and that it would thus behave as a Hertz oscillator; this assumption alone would explain the fact that the effects at a distance increased with an increasing length of transmitting wire. But, if these views were correct, Marconi's transmitting arrangements were not favorable. Then, his transmitter has small capacity, and this cannot be increased so long as the transmitter remains open. But oscillations of this character die out very quickly, as one knew from numerous experiments; they are damped too quickly by the sparks, a fact which Hertz expressed in the form that if the length of the spark is to remain "active" a certain size must not be exceeded.

All these considerations led to arrangements in the following manner: Condensers with a capacity of about the order of the usual Leyden jars were charged singly or in combination to a high potential, and their discharges through appropriately dimensioned self-inductions were employed to feed the transmitter directly or indirectly. Here, for the first time, slower oscillations than Hertz's were undoubtedly employed, and the first question that occurred was whether a coherer with the ordinary connections—where it is embedded in a circuit which is closed in the geometrical sense—would still act sufficiently. Then, the usual idea, which seems to be supported by facts, was that the coherer only responds to very short waves, as only these would produce a potential difference between the two poles sufficient to break down the gap in the coherer. This view seems to be directly confirmed if one first considers the coherer entirely insulated and exposed to the electric waves; and, secondly, if one is certain that it does not follow the periodic currents, but the periodically varying potential difference.

Experiments with the Leyden jar discharges well defined in every respect gave a positive result. First, the conditions of the experiments were varied to a considerable extent, among the arrangements tested being the connections now employed by Slaby and Count Arco. Especially closely examined was an arrangement which I denote as inductive excitation of the transmitter, and to the description of which I will confine myself at present. It is characterized by the fact that one leaves the transmitter quite sparkless, and excites the oscillations in it by induction. The condensers discharge through a primary circuit, and this excites the oscillations in the lower spirally-wound end of the transmitter. The lower end of the latter remains insulated from the earth, and it follows that its assistance in increasing the action to a distance, which Marconi found to be the case with his connections, cannot be interpreted in the usual manner. As a matter of fact, the earth acts, it may be mentioned parenthetically, in causing the transmitter to take up a greater electromagnetic energy.

The advantages of my connections are as follows:

1. In the primary circuit a large amount of energy can be employed usefully; the action of the transmitter increases with the energy employed to a much greater extent than with the Marconi connections, and can be augmented by increasing the capacity of the condensers as well as by increasing the potential.

2. The oscillations of the transmitter are, as is known, hardly active physiologically, in spite of their high potential, and a danger from unintentional contact is therefore quite excluded.

3. Less attention need be paid to the insulation of the transmitter than in the case of electrostatic excitation.

4. The oscillations of the primary condenser circuit are slightly damped, as has been known for a long time (for instance, from the classical experiments of Feddersen). They excite in the sparkless transmitter waves which are still less damped. If, therefore, both are brought to resonance, they increase in the latter case to a very high amplitude.

5. Thus they fulfill the fundamental conditions necessary for electrical tuning between a transmitting and receiving apparatus. The region of useful rays of oscillations will at the same time be extraordinarily extended, as is particularly desirable for this purpose.

The first assertion is proved by the following table:

Primary current in the induction coil.	Relative Electromagnetic Energy in the Transmitter.	
	Marconi connection.	Inductive excitation.
2 amperes	8	26
2½ to 3 amperes	10	40
4 amperes	10	55
6 amperes	10	62

The table shows that the mean energy of the waves in the Marconi transmitter (in consequence of the spark) soon reaches its limit, while it increases considerably in the case of inductive excitation, and, further, that for the same energy expended in the primary, the latter system far surpasses the Marconi transmitter. The second and third claims scarcely need a proof. If, as I demonstrated in my lecture, one connects a Marconi transmitter to earth by means of a long damp thread, the apparatus refuses to work while the inductively

excited transmitter is hardly affected by such a connection. The two last claims follow from resonance experiments. That the waves of the transmitter serve perfectly for a tuned telegraphy will be shown at the conclusion of this article.

Experiments in the open air have demonstrated a superiority over the Marconi transmitter under all conditions. The first observations in Strassburg, in the summer of 1898, already proved this, when the sender and receiver were in sight of one another (partly) as well as when they were hidden from one another by obstacles. The tests were resumed at Easter, 1899, at Cuxhaven, and in the winter of 1899-1900 telegrams were sent to Cuxhaven (Kugelbake) from the small steamer *Silvana* of the North Sea line, in her journey to Helligoland. With a transmitting wire of 15 meters in height on the *Silvana*, and a receiving wire 29 meters high at Kugelbake, regular and perfect messages were received to a distance of 32 km., and signals could be distinguished at distances of 50 km. During the experiments in the autumn of 1900, between Cuxhaven and Helligoland (63 km.) with masts 29 and 31 meters in height respectively at the two stations, comparative tests were made. While with inductive excitation all the signals were received, of 450 transmitted with Marconi connections not a single one could be observed at the receiving station although the supply of energy was pushed to the extreme limits. The remaining conditions were strictly identical. The following table gives a comparison in which the figures referring to the Marconi transmitter are taken from official reports reprinted in the "Elektrotechnische Zeitschrift:"

	Distance of transmission (E.).		Height of mast.		Product of the height of the two masts (F.).	$\frac{E}{P} \times 10^{10}$
	km.	meters.	meters.	meters.		
Inductive charge method:						
<i>Silvana</i> —Kugelbake....	32	15	29	435	74	
<i>Elbe I</i> —Kugelbake....	32	30	29	870	37+	
Helligoland—Kugelbake		31	29	900	69	
Marconi transmitter:						
Borkum—Borkum Fire ship.....	32	40	38	1,520	21	
North American Navy...	18.5	18.5	39	536	25	

The last column in the table gives the distance over which signaling should be possible, calculated according to a well-known rule. On the significance of the rule and the assumptions under which it applies, see Hertz, "Wied. Ann.," Vol. 36, p. 1, 1888. Even if one does not take this rule literally, the summary above proves the undoubted superiority of the transmitting arrangement described. The distance attainable should be, from the present facts and material, two and a half to three times that by the Marconi transmitter, although the receiver employed in the experiments was less sensitive than Marconi's. The fact that large amounts of energy must be available in order to signal over considerable distances with low masts may of course be troublesome in some instances, but in many cases it will hardly come into consideration.

The connections have here been described in their simplest form; they can be varied in different ways and the energy of the transmitter thus increased. The extent of its applicability in radiating large amounts of energy, whether

*The product of the heights of the masts should be about proportional to the distance attainable.
 *The smaller figure is because the actual distance is much smaller than what would have been attainable.

*From the "Electrician," London.
 *The lectures were delivered November 16, 1900, and January 31, 1901, and notices of them appeared in the daily newspapers.

in the form of long or short waves, is not fully portrayed in the above article.

In conclusion, the experimental proof that the oscillations produced are slightly damped remains to be given. This was done by means of resonance experiments. It is known that the Hertz waves, which die away quickly, excite in the resonator its natural period of oscillation to a considerable extent, a phenomenon which at first led to the assumption that a Hertz oscillator, similar to the light of an incandescent body, received a continuous succession of vibrations, and to which the name of multiple resonance was later given. In distinction to this, the oscillations employed here show sharply pronounced resonance phenomena. In my lecture I showed discharges which made 10,000,000 complete oscillations per second, and thus approached closely to Hertz's. These had a visible effect on a distant wire circuit in which a Geissler tube was included, provided this circuit was in tune.

It would thus be possible to base on these discharges a tuned system of telegraphy. But resonance phenomena of this kind are not favorable for other reasons; they show, it is true, that good conditions are fulfilled in the transmitter, but the task still remains to construct a correspondingly good receiver.

The problem was, therefore, attacked in another manner. The object was, on the one hand, to tune the oscillating systems between narrow limits, and on the other to increase the receiver effects. This latter could be done in two ways. One way would be to make as great as possible the energy taken up by the receiver—a course which was not followed in this case. If one considers the energy taken up as a fixed quantity, it only remains to concentrate it on the receiving apparatus, so that the latter benefits by it as far as possible, exclusively. The arrangement then works as a lens, which does not increase the energy of the light but concentrates it. I confine myself here to mentioning experiments which I showed in my lecture. These demonstrated that the electric waves which pass the receiver can be concentrated 20 times or more. Then they can be made to act in the form of heat on a microphone contact or on a coherer of the most suitable form, and the latter may be placed in such a way that its action cannot fail whether it reacts with current or potential difference.

I further showed in the lecture the sharpness of the tuning. Very slight changes in the tuning immediately diminished the localized energy very considerably. As the energy only collects in the tuned parts, the other parts will refuse to act, and thus the problem of the so called multiplex telegraphy is solved in a very complete manner.

An Invention for Detecting Distant Thunderstorms.

An instrument to which considerable interest attaches has been devised and described by M. T. Tommasina. Its object is to detect distant thunderstorms. The apparatus consists essentially of a self-decohering carbon coherer placed in circuit with a dry cell and an ordinary telephone receiver. The grains of carbon are hermetically sealed in a glass tube attached to the telephone magnet, so as to lie horizontally when the receiver is placed to the ear. The impression produced on the observer is that of being transported into the neighborhood of the thunderstorm which might yet be

hidden below the horizon. To strengthen the effect the author used three copper "antennae," each 30 m. long. In this manner it was found possible to observe the development of a violent thunderstorm at a distance twelve hours before it broke loose at the observing station, which was situated on the Lago Maggiore. A distant rain is indicated by a rattling sound before a cloud is visible.—"Engineer," London.

THE OSMIUM LAMP.*

BY WILLIAM J. HAMMER.

During my stay in Vienna last October, through the courtesy of Director Gallia of the Auer Company, I was permitted to see several of the new "osmium" incandescent lamps burning, and although I was unable to secure full particulars about this new and interesting development I learned that the lamp, which is the invention of Dr. Auer von Welsbach, operates at an emf. of 25 volts and shows an efficiency of from .9 to 1 watt per candle. The three lamps which I saw in use were all connected in parallel and operated with key sockets, and differed but little in general appearance from an ordinary carbon filament lamp. The globe was somewhat longer than an ordinary 16 cp. lamp, and the filament, which was of the hairpin shape, was much longer. It must be used in a vertical position, owing to its flexibility. I was told that these lamps had a life under test of 700 to 800 hours. It will be interesting to learn to what extent the low voltage of the lamp and the rarity of the material used in its manufacture will effect its commercial application. It had been intended to show the osmium lamp at Paris before the close of the exhibition, but there was not sufficient time. "Osmium," which was discovered by Tennant in 1803, is a blue-white metallic element and is almost infusible. For a long time it was known only as a crystalline grainlike material, and when fused in the electric arc as a hard, brittle substance unfit to be worked. I was informed in Paris, where I first heard of this lamp, that the successful method of handling this material, which has always been most difficult to work with, was due to a large extent to Mr. Waldron Shapleigh, of the American Welsbach Company, which concern controls the patent rights for the United States. According to Engineer Scholz in his lecture before the German Incandescent Gas-light Company, on January 23, 1901, an osmium lamp after burning 1,500 hours was still intact, and had fallen off in candle-power but 12 per cent.

Its efficiency at starting was 1.45 watts per cp., and at the end of 1,500 hours was 1.7 watts. It is claimed that as long as the filament remains intact it can be renewed several times. While the present range of voltage for these pure osmium lamps is 25 to 50 volts, a number of filaments can be connected in series or multiple series for higher potentials, and it is proposed to increase the resistance by coating or uniting the osmium with certain oxides. Mr. Scholz refers to a test conducted upon 4-25 volt osmium lamps in series, and 4-100 volt carbon lamps in parallel. The osmium lamp showed a consumption of 0.96 amperes, and the carbon

*Abstract of paper on "Important European Electrical and Engineering Developments at the Close of the Nineteenth Century," presented at the 151st General Meeting of the American Institute of Electrical Engineers, New York, February 28, 1901.

lamp 2-40 amperes, the former effecting a saving of 60 per cent.

A 20 cp. osmium lamp run at 27 volts required 24 watts, and a 20 cp. carbon lamp required 68 watts, the former effecting a saving of 44 watts, or about 35 per cent.

The osmium lamp was much the coolest, by reason of its higher efficiency. I had hoped to be able to show you an osmium lamp this evening and give some fuller data, but was unable to do so. I have brought with me a number of the foreign types of Nernst lamps for your consideration. I have, also, several dicarbide of calcium lamps, which type have been manufactured to some extent abroad. They are the invention of Mr. Langhans, of Berlin, to whom I am indebted for them. It may interest some of our members to learn that the Allgemeine Elektrizitäts Gesellschaft of Berlin are now making all their carbon filament lamps without platinum leading-in wires, using, so I am informed, iron wire, the sealing being done in an atmosphere of carbon monoxide. The A. E. G. purchased the patent from Schott, the well-known glass manufacturer of Jena. I am told these lamps give out quickly, diminishing to a dull red. In London I found a company which has been formed for the purpose of "rejuvenating" incandescent lamps. The filaments which have gone off in efficiency and candle power are taken out of the globe and re-treated, the globe cleaned of its smoky deposit and the lamp resealed and re-exhausted. I did not learn just how the globes were to be cleaned or what the rejuvenation was to cost. There are also several lamps known as "watt" lamps being exploited in Europe. They have a high efficiency, and are very simple, and cheaply constructed, and have a life of perhaps 200 to 400 hours. They make no pretense of being long-burning, but rely upon their high efficiency and low first cost.

UTILIZATION OF "HIGH FURNACE" GASES AND BIG GAS ENGINES FOR ELECTRICAL PURPOSES.

The utilization of high furnace or blast gases marks an epoch, not only in the employment of engines of great power but in the supplying of gas a new field for the application of electrical machinery. It is estimated that a blast-furnace having a capacity of 100 tons of pig-iron per 24 hours, produces 7,000,000 cubic feet of gas daily, equivalent to 2,800 hp. If we deduct the power required to drive the furnace proper, there remains 2,000 hp., which, so far, have been entirely wasted, and which, it has been found, may be successfully utilized in gas engines, and it appears that only one-sixth to one-quarter as much gas is required as would be necessary, when burning the same gases under boilers for producing steam power, and furthermore enables us to dispense with costly boilers. Between 25 and 30 years ago it was customary to burn these gases at the top of the stack. They are even so burned to-day to some extent. They were thought to be too poor in quality, and too variable in composition; too full of dust, particularly metallic particles, tending to clog and injure the moving parts; too full of acid matter, and of too high a temperature to enable their use in gas engines; but means have been found by passing the gases on their way from the stack to the engine through pipes and dust pockets in which the particles settle, and through coke and water scrubbers and saw-dust, so that the temperature is lowered, and the gases sufficiently well cleaned. Even at the Friedenshütte Iron Works, which I visit-

ed in upper Silesia, they operated successfully with gas charged with 40 per cent. of zinc dust, which only required more purifiers. Although some analyses show the presence of sulphuric and phosphoric acids and chlorine, the alkalies and lime probably neutralize their effect, and there is no apparent corrosion. There is little trouble from variations in quality, and gas works well in a gas engine of a quality which ignites with difficulty under a boiler. The first application of the high furnace gas was made in February, 1895, at Wishaw Iron Works, near Glasgow, with a 20 hp. gas engine, which indicated 15 hp. when driven with these gases. During the same year high furnace gases were applied on an eight hp. engine at the Cockerill Iron Works at Seraing, Belgium, and at the Hörde Iron Works in Westphalia, Germany, where they were used in a 12 hp. engine. The first patent for the utilization of high furnace gases in gas engines was taken out the previous year, in May, 1894, by Mr. B. H. Thwaite of England. The high furnace gases are similar in quality to the forms of producer and power gas made by Dowson and other processes, and taken directly from the stack, contain as a rule about 27 per cent. of combustible gases, chiefly carbon monoxide, and a little marsh gas and hydrogen, the balance being mainly (about 57 per cent.) inert nitrogen. It is estimated that at the blast furnaces in England alone over 2,000,000 hp. is annually going to waste which might be utilized for electrical purposes. The gas engine industry is about 30 years old. During that time, one company, the Otto, has sold in England and Germany alone about 37,000 gas engines, approximating 500,000 hp. As indicating the development of the large gas engine industry, it is interesting to note that the Cockerill Company of Seraing, Belgium, and its licensees, has sold in less than a year 70 engines of the Delamare, Deboutteville & Cockerill system. This engine develops 650 hp. when employing high furnace gases. The engine cylinder is 4' 3" diameter by 4' 7" stroke. The diameter of the air cylinder is 5' 7" by 4' 7" stroke. The length of connecting rod, connecting two cylinders, is 14' 5", diameter 11.8". Tested without blowing cylinder, this engine showed 573 BHP., with a consumption of 123.7 cubic feet of gas per BHP. or with a mechanical efficiency of 72 per cent. and a thermal efficiency taking the BHP. of 20 per cent. With the blower connected, this engine showed 886 indicated hp. and 725 BHP., with a gas consumption of 101 cubic feet per BHP. hour and a thermal efficiency taking the indicated hp. of 31.5 per cent. Until recently the speed of these blowers has ranged from 50 to 60 strokes per minute. An ordinary gas engine runs at a speed of 100 to 150 revolutions per minute, according to its size, and giving its maximum efficiency at maximum speed. (According to Kennedy and others a gas engine at one-half load consumes 25 per cent. more gas than at full load). I saw recently at Falvelhütte in Upper Silesia, Germany, a plant equipped with Horbiger and Rogler valves, enabling these blowers, which in this case were operated by steam generated by furnace gas, to operate at a speed of 80 strokes per minute. There are several types of valves now on the market, which enables these blowers to be run at a speed, adapting them to be driven successfully by large gas engines.

An engine which I had the pleasure of seeing at the Cockerill Works at Seraing, Belgium, had been running steadily for over two

years, both night and day, operating with high furnace gas. Prof. Aimé Witz' test showed an average of 181 BHP., and it showed a mechanical efficiency of 85 per cent., and consumed 116.5 cubic feet of furnace gas per BHP. hour. The thermal efficiency taking the BHP. is 20 per cent. The speed is 105 revolutions per minute. The cylinder has a diameter of 31.5" by 39.3" stroke. The Friedenshütte Iron Works in Upper Silesia, at the time of my recent visit to the installation, consisted of two 200 hp. gas engines direct coupled to two direct current dynamos, and two 300 hp. gas engines direct coupled to two alternating current dynamos. The gas engines are of the Otto-Deutz type, driving Shuckert dynamos. They were supplying a couple of hundred arc lamps, and several thousand incandescent lamps, and electricity for power purposes. The total hp. was 1,000, and at the time of my visit this was being increased to 2,400 hp. The plant will be in operation shortly, consisting of six 300 hp. engines for power purposes, and three 200 hp. for lighting.

Engineering Education.

In his inaugural address before the Birmingham Local Section of the Institution of Electrical Engineers in England, Prof. Oliver Lodge expressed himself warmly in sympathy with the movement prominently identified with Prof. Perry, in favor of reforming mathematical teaching. Euclid himself was splendid, he said, so was his book, for its day and generation, and its purpose as a system of geometrical philosophy admirable; but it had had its day, and for elementary and popular purposes should cease to be. We were too busy, there was too much to learn nowadays, to have time to cross every river by ascending to its source and walking down the other side. Professional guides along the old river path still attempted to hide the bridges, because if they were too easily seen their occupation would be gone. But the bridges were there, and sooner or later even school boys would be permitted to make use of them, and enjoy the country on the other side, without spending all their days in a toilsome and deterrent mode of getting there over a route approved by the ancients. If there were any workers in engineering or any other branch of technology who affected to despise pure science, and said that its pursuit was needless, they were hardly worthy of notice—it must be affectation. It was to be heartily admitted that the enlarged experience, and the large-scale experiments rendered possible by the wealth of communities, who applied science to their own convenience, reacted with immense advantage on pure science itself. But those large-scale experiments were hardly like experiments proper. They should not readily be tampered with. Facts known to few with effort were science, but those same facts when known to all without effort were aesthetic. Meanwhile, the justification for all pure dry science lay essentially in its ultimately human bearings. If a subject could be proved to be never capable of any human influence or any relation to humanity, however developed it might become, then its pursuit would be rightly condemned. But such proof could never be given. Again and again had the most unlikely channels developed into fruitful streams.

A by-law to provide for the installation of an electric light plant for the town of Thesalon, Ont., will be submitted to the rate payers on May 6th next.

THE KODOLITSCHÉ ELECTRIC MACHINE TOOLS.

Translated for ELECTRICITY from "L'Étincelle Électrique," Paris, France.

Among the electrically operated machine tools which are so generally coming into use from day to day, in our work shops and shipyards, we believe the Kodolitsche machines may justly claim to be particularly worthy of our attention. Although they are of the first order as regards merit and enjoy a well deserved and immense reputation in foreign countries, they are unfortunately as yet very little known in France. We believe we are rendering a service to French manufacturers by bringing these tools to the attention of our readers.

M. de Kodolitsche, who is the director of the Lloyd Arsenal in Austria, has invented a large number of boring drills to meet all the varied requirements of all branches of industry, in fact his machines differ very little from each other except in the arrangement of details and in their size; as a whole they are all modifications of a single type, which we summarize in the following description.

An electric motor is supported in such a manner as to be able to take any desired position in space, by being mounted upon a revolvable vertical bearing which is supported on a horizontal axis, which can be placed in any part of the shop, according to the nature of the work, or mounted on a car specially constructed to make it more readily movable from place to place.

Motion is transmitted from the motor to the working tool by means of a telescopic shaft universally jointed to permit of the tool being turned in any desired direction. The tool itself may be fastened to the work by ordinary clamps or magnetically attached to the work by means of electro-magnets.

By such a simple construction the apparatus becomes quite easy to manipulate and it may be brought to bear on the most difficult and complicated work.

We will add that on account of the great constructive strength of this tool and the complete absence of any complicated or delicate parts, the Kodolitsch drills have a just title to be regarded by those best able to judge of them as being the most perfect of any that have been constructed up to the present time. With the small type fitted with a motor of 1 hp. holes can be drilled and reamed varying from 6 to 25 mm. in diameter.

The most powerful type carries a 3 hp. electric motor and it is capable of drilling, or of cutting threads in holes up to 90 mm. in diameter.

The electric motor is ordinarily constructed to be operated by a continuous current, but it can likewise be constructed for tri-phase currents.

The Kodolitsche electric riveting machines are constructed on an entirely new principle which is extremely ingenious.

The driving electric motor carries an electro-magnet around in its revolutions, and when current passes through this movable magnet it engages a metallic mass in some manner, which is placed in front of the electro-magnet and by means of a screw provided with a traveling nut the movement of this metallic mass results in operating the movable header of the riveter.

At the precise moment when the contact

with the rivet should take place the electromagnetic contact is automatically released, but the accumulated operative energy in the metallic mass is translated into a pressure upon the head of the riveter capable of producing the desired head on the rivet, whereupon the movable parts automatically replace themselves and the machine is ready to operate upon the next rivet.

Two types of riveters have been built. First, a fixed type giving the rivet head pressure of 70,000 kilograms and capable of heading rivets up to 32 mm. This type is mounted on a car and when operated in combination with a stationary or movable crane it becomes a very handy piece of apparatus, capable of heading 150 rivets per hour, provided the rivets are well placed in the holes. Second, a movable type with adjustable supports capable of permitting riveting to be done in all positions. This machine can head rivets of 25 mm. in diameter with a pressure of 30,000 kilograms at a rate of 150 per hour.

Two men are sufficient to operate this machine when provided with a helper to heat the rivets.

The useful results secured are very great, for the riveting is extremely perfect in all details. The expense incurred for power is quite small, being about four times less than that necessary to operate a pneumatic riveting machine capable of producing the same grade of work.

From their first appearance on the market these riveting machines have received hearty welcome from all those who are capable of judging of their merits and all are agreed that they fill a demand, and particularly the movable riveting machine; for outside of the advantages secured by an electric machine over a hydraulic or pneumatic riveter they are in construction unrivaled, which makes them a perfect machine.

ELECTRICAL MEASURING INSTRUMENTS.

It was some years after electric lighting was introduced before electrical measuring instruments were fixed at collieries at all, partly owing, says the "Colliery Guardian," London, to the desire of contractors to keep their prices down, and partly owing to the desire of colliery owners and managers to save money. It is probable that no portion of an electrical installation saves more money if properly put in than the measuring instruments. A proper series of amperemeters and voltmeters will tell a tale to the trained eye at a glance, that will in a very short time save many times their value, under certain conditions which are very apt to occur at collieries, and within certain limits it is difficult to err in the matter of having too many of them. Thus, in addition to the instruments on the switchboard in the engine house, at bank, a voltmeter and an amperemeter near the pit bottom, will give timely warning of injury to the shaft cables, and similar instruments at each station where a motor is used will not only give warning of any damage to the cables leading to the motor, but will also tell a continuous tale of the apparatus itself, of the motor, the pump, or haulage plant, or whatever the motor may be driving. But it must be remembered that the electrical measuring instrument can err like any other apparatus, and careful watch should be kept for signs of irregularities.

Electric measuring instruments are subject

to influences of their own, which tend to alter the value of the reading on their dials. Thus in some of the instruments which were made a few years ago continuous work altered their readings, especially with voltmeters, owing to the resistance of their wire coils increasing with the heat delivered to them by the passage of the currents themselves, which were used in measurement. In addition to sources of error of this kind, some instruments depend upon the strength of a permanent magnet for the value of their readings, and as all permanent magnets lose their magnetism with time, their readings alter in value. Also all instruments have some form of needle which swings over a dial, or something similar, and the pivots of this needle become partially clogged with dirt, dust which has penetrated into the instrument, notwithstanding the utmost care, also to rust, which has been created by moisture. These causes tend to lower the readings of the instruments, and are common to nearly all instruments, and may lead to machines being unduly strained in consequence.

The remedy is—compare the instruments with new ones purchased from time to time for the purpose, and in the case of voltmeters compare the pressure read off on the dial with that which should be given with a new incandescent lamp made by a well-known firm. A 16-candle power lamp is a very good standard of pressure, if of well-known make, and a little practice soon enables one to judge the color which the lamp should be when the pressure is at a certain figure. Also having such a standard for pressure, it is always possible to check the ampere readings approximately, near enough for practical work, by calculating the current that ought to be going out with a certain number of lamps burning at a certain pressure. If there appears to be considerable discrepancy the instruments should be compared with new or with any standard available. Instruments which have begun to read incorrectly need not necessarily be discarded. All that is wanted in industrial work is a knowledge of what is going on, and this may be obtained by applying a correction to the instrument.

LONDON NOTES.

(From our London Correspondent.)

Conduit and Trolley Traction.

A very full paper, entitled "Combined Trolley and Conduit Tramway Systems," was read on March 15 before the London Institution of Mechanical Engineers, the author being Mr. A. N. Connett. He discussed various systems, having in mind their application to central thoroughfares where municipal authorities are anxious not to employ overhead trolley wires.

The Electric Lighting of the City.

The annual report of the City of London Electric Lighting Company gives a very poor showing. Ordinary stockholders who a few years ago received 10 per cent. and 6 per cent. dividends have to go without a penny interest upon their capital invested for the year 1900. The business has gone ahead enormously, between eleven and twelve million units being sold for private lighting and about 540,000 8 cp. lamps being connected, but expensive litigation, the high price of coal and greatly reduced charges to consumers have brought the profit to a very low figure. The company

has the best area in London, but a combination of evils has brought about the present state of affairs, and the competition now being energetically pressed by the "live" Charing Cross Company renders the outlook anything but bright. When the chapter of causes of the failure comes to be written it will afford most interesting though doleful reading.

Steam Engines for Electrical Work.

The Manchester branch of the Institution of Electrical Engineers has just considered and discussed a paper by Mr. J. S. Raworth on "The Application of Steam Power to the Generation of Electrical Energy." Mr. Raworth pointed out the merits of English engines for electric traction, a class of work for which they are considered now to be especially well adapted.

NEW YORK ELECTRICAL SOCIETY.

Through the courtesy of the New York Electrical Vehicle Transportation Company, the New York Electrical Society held its 213th meeting at the new Main Station, Eighth avenue and 49th street, Wednesday, March 27. The Society was welcomed by Mr. Henry Sanderson, president of the company. The meeting was held in one of the upstairs departments, where Mr. George Herbert Condict, consulting engineer of the company, mounted on an automobile as a rostrum, delivered a brief practical address on automobile work in New York City, and gave various details with regard to the system. Mr. Condict stated that the company now had over 300 vehicles in operation, with capacity for at least 700, whereas only four years ago it had but twelve in operation. He attributed the great success and popularity obtained to the fact that when he himself was unable to reach New York from Philadelphia for three days, owing to the blizzard of 1899, and when none of the horse vehicles could ply the streets of New York, the electric automobiles were found able to plow their way through the snow drifts with comparative ease. "But for the performance of the electric automobiles on that memorable night," said Mr. Condict, "New York society would have been paralyzed, and even as it was, the vehicles were busy till late the next morning, carrying home society people who had been stalled at balls, theaters and private residences." Strangely enough, the New York Electrical Society visited the old stables of the company the same night, upon which occasion Mr. Condict was to have addressed it.

After Mr. Condict's remarks the whole of the vast building in all its departments was thrown open to the visitors, numbering between 300 and 400, who roamed about freely at will, watching the machinery in operation, and taking a particular interest in the ingenious methods and appliances by which the batteries were taken to and from the charging room and inserted into and removed from the vehicles in service. After this examination the company served coffee and other refreshments, and it was not until 11 o'clock that the members dispersed, the Society having scored another emphatic success in its plan of visiting electric installations so as to enable its members to see for themselves the processes and details of operation.

President Martin announced that on April 25, at Columbia University, Mr. Charles F. Scott, electrician of the Westinghouse Electric &

Manufacturing Company, would deliver a lecture, illustrated by apparatus and experiments, on "Alternating Current Motors." Mr. Scott's well-known ability as an inventor and his gift of clear exposition will render this one of the most valuable meetings held by the Society during its remarkably active and successful season, which, before it closes, will include one or two more very interesting evenings.

The Secretary requests us to announce that the striking lecture on "Systems of Electric Transmission and Distribution," delivered before the Society by Mr. C. P. Steinmetz, has been issued in a neat and handy pamphlet, octavo size, which can now be secured from him by direct application or by mail at 25 cents a copy. This is one of the best popular treatments of the alternating current now available, and requests for it are already such as to insure its wide circulation.

The following members were elected: E. H. Mullin, J. Lloyd Wayne and Franklin S. Holmes, all of New York City.

BOOKS RECEIVED.

MOODY'S MANUAL OF INDUSTRIAL AND MISCELLANEOUS SECURITIES. The O. C. Lewis Company, 6 Wall street, New York.

This work is bound in cloth and contains over 1,100 pages of matter, giving statistics and information relating to railway companies, power, lighting and automobile companies and miscellaneous concerns.

A TEXT BOOK OF MECHANICAL DRAWING AND ELEMENTARY MACHINE DESIGN. By JOHN S. REID and DAVID REID. Published by John Wiley & Sons, New York.

This work, which is handsomely gotten up, is fully illustrated and contains 380 pages of matter relating to machine design.

DYNAMO ELECTRIC MACHINERY. By SAMUEL SHELDON and HOBART MASON. Published by D. Van Nostrand Company, New York. Bound in cloth. Price \$2.50.

As the authors state this book, which is fully illustrated and contains some 280 pages of matter, is intended for the general reader as well as a book of reference for engineers.

ELECTRIC LIGHTING. By FRANCIS B. CROCKER. Published by D. Van Nostrand Company, New York. Bound in cloth. Price \$3.

This work, which contains some 500 pages of reading matter, is a practical exposition of the art of electric lighting for the use of engineers, students and others interested in the installation or operation of electrical plants. The work also contains much general information of value and is fully illustrated.

MODERN ELECTRIC RAILWAY MOTORS. By GEORGE T. HANCHETT. Published by the Street Railway Publishing Company, New York. Bound in cloth.

This work contains about 200 pages of interesting matter relating to railway motors. As the author states the object of the book is to show how electric railway motors are made to-day and why they are made so. The book is free from intricate mathematics and should be in the hands of all persons who have just entered or are about to enter active work in the electric railway field.

An act incorporating the London, Aylmer and North Shore Electric Railway, of Ontario, has passed the Railway Committee of the Ontario Legislature. This road will run from London, Ont., to Aylmer and Port Burwell. Capital stock is \$850,000.

MODEL HOTEL EQUIPMENTS.

In the model hotel or apartment house of to-day telephones are quite as necessary as the elevators and mail chutes. After many unfavorable experiences, architects, engineers and contractors have gradually discarded the cheap and inefficient telephone apparatus and are choosing more for quality and durability than price. For these reasons the New Hotel Essex at the northwest corner of 56th street and Madison avenue, New York City, is equipped with genuine Ericsson telephones

FIG. 1.

and switchboard, which give quick communication from every suite and hall to the office, and place the management within easy reach of every patron. The room telephones are all of the Hand Microtelephone pattern, as shown in Fig. 1, and instead of being a disfigurement to the wall, they serve as an ornament to the finely finished suites. Each of these is fitted with a flexible cord of sufficient length to enable the patron to call the office, or to answer a call if desired, without rising from the couch or bed. When through using, the releasing of a lever in the handle makes and breaks all necessary connections and it is not necessary to replace on a hook, as in ordinary

FIG. 2.

telephones. When first introduced, the Hand Microtelephone was considered a curiosity, but its utility and compactness has made it a great favorite, and it bids fair to soon take the place of the once popular nickel desk set, and in many

cases replace the wall instrument as well. In operation, the office is called by simply pressing the contact in the handle of the Hand Microtelephone, which act throws the drop at the switchboard. The operator connects in the usual manner, answering the call, and if desired calls some other suite and enables the two to converse. The call to the suite is made by a small musical gong placed near the ceiling, which, while loud enough to call a person, is not harsh enough to disturb one. As shown in Fig. 2 the wall telephone for use in the halls is neat, compact, and takes small space. It is fitted with the standard Ericsson receiver and transmitter, now so well known. In operation it is used in the usual way, the act of taking the receiver from the hook, sending the call for the operator in the office. With both instruments, when the line is released, the operator is at once notified and quickly disconnects. The switchboard is shown in Fig. 3, and besides being positive and rapid in operation, it is of the finest mechanical construction, is very durable, is handsomely finished, and while occupying very little space compared to its capacity, is of a peculiar design, which distinguishes it from ordinary boards. The system is operated by centralized batteries and is so

FIG. 3.

arranged that when desired a motor generator can be thrown into circuit for calling.

In addition to this system, the Ericsson Telephone Co., 296 Broadway, New York, makes a number of different systems and telephones of special design and finish for special uses, including intercommunicating patterns and for exchange use.

Proposals Invited.

The Treasury Department Supervising Architect will receive sealed proposals until 2 o'clock p. m. April 25 for the installation of an electric wiring system for the outbuildings of the U. S. Bureau of Engraving and Printing, Washington, D. C.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The town council of the town of Glace Bay, C. B., in the province of Nova Scotia, will likely install an electric light plant during the coming summer.

The Guelph Railway Company, of Guelph, Ont., has secured a charter to construct an electric railway to Hespeler, via Puslinch Lake, and also to Berlin, Ont.

The city council of Vancouver, B. C., has decided to grant a franchise to the Stave Lake Power Company to supply light and power within the city.

The Legislature of Nova Scotia will be asked to give the town of Yarmouth, N. S., authority to borrow \$10,000 for the purpose of installing an electric light plant to be operated and owned by the municipality.

Mr. J. M. Harris, of the Recco mine, Sandon, B. C., purposes establishing an electric light and power plant of 1,000 hp. at Three Forks, B. C.

A movement is now on foot to connect Bala, Port Carling and Bracebridge, Ont., by telephone.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended March 20:

Alexandria, 1 package, \$78; Antwerp, 6 cases motor carriages, \$997; 34 packages, \$3,285; Australia, 1 package, \$25; Brazil, 212 packages, \$14,137; 51 cases, \$4,797; Bremen, 3 packages, \$110; British East Indies, 19 packages, \$8,052; British West Indies, 57 cases, \$1,456; Central America, 670 packages, \$7,310; China, 9 packages \$322; Cuba, 96 cases \$7,286; Dutch West Indies, 23 packages, \$718; Frankfurt, 1 case, \$150; French Possessions in Africa, 94 cases, \$12,350; Genoa, 48 packages, \$16,255; Hamburg, 43, packages, \$5,044; Havre, 76 packages, \$5,375; Hayti, 58 packages, \$381; Japan, 49 cases, \$17,414; Korea, 66 cases, \$14,207; Lisbon, 30 packages, \$30,876; 54 electric cars, \$112,006; Liverpool, 758 packages, \$32,383; 3 packages auto vehicles, \$920; London, 24 packages motor vehicles and parts, \$6,000; 208 packages, \$10,563; Marseilles, 45 cases, \$2,702; Mexico, 798 packages, \$7,011; Newcastle, 4 packages, \$400; Newfoundland, 20 packages, \$586; Nova Scotia, 92 packages, \$865.

The following are the exports of electrical material from the port of New York, for the week ended March 27:

Alicante, 8 packages, \$1,347; Antwerp, 5 packages, \$384; Australia, 6 cases, \$314; Barcelona, 12 packages, \$573; Bournemouth, 1 case, \$700; Brazil, 14 packages, \$1,296; British East Indies, 19 packages, \$1,116; British Guiana, 4 packages, \$38; British Possessions in Africa, 2 cases electrical machinery, \$75; 110 packages, \$12,701; 3 cases motor vehicles, \$925; British West Indies, 9 packages, \$201; Central America, 13 packages, \$916; Chili, 9 packages, \$434; Christiana, 1 package, \$300; Copenhagen, 6 packages, \$90; Cuba, 175 packages, \$4,589; Ecuador, 5 packages, \$60; Genoa, 37 packages, \$3,672; Glasgow, 247 cases, \$36,256; 73 reels, electric cable, \$28,376; Hamburg, 83 packages, \$6,660; 87 cases, \$10,436; Leith, 3 packages, \$178; Liecester, 2 cases, \$230; Liverpool, 101 packages, \$12,869; London, 225 cases, \$9,906; 57 packages, \$4,404; 4 packages motor vehicles, \$1,930; Manchester, 1 package, \$375; Mexico,

30 cases, \$1,478; Milan, 6 cases, \$269; Naples, 2 cases, \$285; Newcastle, 90 packages, \$48,677; New Zealand, 1 package, \$28; Preston, 1 package, \$25; Peru, 15 cases, \$242; Rotterdam, 7 cases, \$74; Sheffield, 16 cases, \$2,000; Southampton, 1 case, \$500; 2 packages, \$101; St. Petersburg, 2 packages, \$150; U. S. Colombia, 205 cases, \$1,075; 2 reels cable, \$29; Venezuela, 139 cases, \$738; Zurich, 1 case, \$70.

PERSONAL MENTION.

Mr. J. B. Ware, formerly of Grand Rapids, Mich., has accepted the position as general manager of the People's Telephone Company of Detroit.

Mr. Sylvester B. French has been appointed manager of the New York & Pennsylvania Telephone & Telegraph Company for the district which embraces Elmira, Watkins, Horseheads and Troy.

Mr. Charles Armstrong, of Chicago, has been engaged to supervise the electrical exhibit of the Milwaukee, Wis., Industrial Exposition to be held next fall.

Mr. George W. Aldridge has accepted the position of general manager and overseer of the lighting interests of the Citizens' Light & Power Company in Rochester, N. Y., and other cities.

Mr. S. C. Cooper of this city has been elected assistant to Secretary W. T. Irwin of the Cincinnati (O.) Traction Company.

Mr. Clarke Merchant was recently elected president of the Schuylkill Traction Company of Philadelphia, Pa.

INCORPORATIONS.

The Amusement Electrical Company, Brooklyn, N. Y. Capital stock, \$4,000. Directors: G. W. Woods, H. C. Bolton and A. J. Moore, New York.

The Billerica Electric Company, Billerica, Mass. Capital stock, \$20,000. Officers: W. A. Dicuker, president; C. S. Cummings, second treasurer.

The Cooper Electric Light Company, Cooper, Tex. Capital stock, \$10,000. Incorporators: Charles Tuttle, William R. Evans and Ed. S. Kelley, of Kaufman, Tex.

The Emporia Railway, Lighting & Repository Company, New York City—to distribute electricity or any other motive, lighting or heating power. Capital stock, \$150,000.

The W. N. Thayer Company, New York City—to manufacture electrical machinery. Capital stock, \$5,000. Directors: W. N. Thayer and G. N. Warner, New York City; E. G. Bernard, Troy.

The Merritt & Lockwood Company, New York City—to deal in electrical goods. Capital stock, \$10,000. Directors: T. F. Merritt, New York City; E. F. Lockwood and Elizabeth M. Lockwood, Mount Vernon.

The Kero Arc Light Company, New York City—to manufacture lamps. Capital stock, \$300,000. Incorporators: Willard B. Mack, E. H. Fessenden and J. F. Place.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 26, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

670,415. Electrically-Operated Brake. George D. Burton, Boston, Mass. Filed April 13, 1899. Renewed Aug. 13, 1900.

670,419-670,420. Railway-Brake. Anton Duppler, Jersey City, N. J., assignor, by direct and mesne assignments, to Phoebus H. Alexander, New York City, and the Compound Magnet Brake Company of New Jersey. Filed Oct. 17, 1900, June 12, 1900.

670,651. Electric Railway. William T. Van Dorn, Chicago, Ill. Filed April 27, 1900.

670,712. Trolley-Wheel. Robert Kuhn, Cincinnati, O. Filed Nov. 10, 1900.

670,855. Safety-Trolley Device. Charles W. Diamond, New Orleans, La., assignor to Moise Levy, Jr., same place. Filed July 18, 1900.

670,873. Railway-Brake. Alfred Green, Rochester, N. Y., assignor, by mesne assignments, to the Compound Magnet Brake Company of New Jersey. Filed March 1, 1901.

670,895. Unit-Multiple System of Electrical Train Control. Frederick C. Esmond, Brooklyn, N. Y., assignor to the Esmond Electric Traction & Signal Company of West Virginia. Filed Aug. 2, 1898.

670,898. Unit-Multiple System of Electric Railways. Frederick C. Esmond, Brooklyn, N. Y., assignor to the Es-

mond Electric Traction & Signal Company of West Virginia. Filed Aug. 2, 1898.

670,897-670,898. Unit-Multiple System of Train Control. Frederick C. Esmond, Brooklyn, N. Y., assignor to the Esmond Electric Traction & Signal Company of West Virginia. Filed Jan. 25, 1900, April 10, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

670,536. Shield and Reflector for Electric Lights. Thomas E. Clark and Richard Ernst, Detroit, Mich.; said Ernst assignor to said Clark. Filed June 23, 1900.

670,552. Handle and Adjuster for Electric Lights. Ellis E. Brown, Reading, Pa. Filed Oct. 16, 1900.

670,658. Electric-Arc Lamp. Edgar A. Beck, Los Angeles, Cal. Filed May 7, 1900.

670,905. Lamp Shade or Reflector. Reinhart W. Pittman, New York City, assignor to Alan R. Fergusson, Mount Vernon, N. Y. Filed Aug. 22, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

670,587. Continuous-Current Machine and Apparatus. Max Deri, Vienna, Austria-Hungary. Filed March 24, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

670,538. Subscriber's Telephone-Circuit. William W. Dean, Chicago, Ill., assignor to the Kellogg Switchboard & Supply Company, same place. Filed April 28, 1899.

670,564. Telephone-Receiver. Charles H. North, Cleveland, O., assignor to the North Electric Company, same place. Filed Sept. 27, 1899.

MISCELLANEOUS.

670,440. Electric Ore Concentrator. Henry M. Sutton and Walter L. Steele, Dallas, Tex. Filed July 18, 1900.

670,454. Commutator. George W. Nistle, Chicago, Ill. Filed Jan. 29, 1901.

670,463. Alarm Attachment for Drip-Pans. Louis Wahl and George Keyes, Brooklyn, N. Y., assignors of one-third to Peter Hale, same place. Filed Jan. 21, 1901.

670,474-670,475. Storage Battery. Justus B. Entz, Philadelphia, Pa., assignor to the Electric Storage Battery Company, same place. Filed July 9, 1900.

670,476. Electrical Distribution. Justus B. Entz, Philadelphia, Pa., assignor to the Electric Storage Battery Company, same place. Filed Sept. 1, 1900.

670,547. Electrical Connecting Device. John S. Schenck, Brooklyn, N. Y. Filed Jan. 20, 1900.

670,588. Primary Electric Battery. Jean P. Fontaine, Paris, France. Filed Jan. 9, 1900.

670,634. Electric Clock. Fred L. Gregory, Chicago, Ill., assignor to the Semphire Clock Company, same place. Filed March 2, 1900.

670,648. Element for Secondary Batteries. John T. Storey, Philadelphia, Pa., assignor of two-thirds to Henry B. Gross and Claude S. Jarvis, same place. Filed June 25, 1900.

670,667. Electric Heater. William S. Hadaway, Jr., New York City. Filed Sept. 24, 1898.

670,668. Apparatus for Baking. William S. Hadaway, Jr., New York City. Filed Feb. 1, 1899.

670,669. Electric Stove. William S. Hadaway, Jr., New York City. Filed Feb. 1, 1899.

670,670. Electric Stove. William S. Hadaway, Jr., East Orange, N. J. Filed June 30, 1900.

670,697. System of Telegraphy. Frederick Bedell, Ithaca, N. Y. Filed Oct. 20, 1899.

670,711. Coherer for Detecting Electric Waves. Adolf Koepsel, Charlottenburg, Germany. Filed Aug. 25, 1900.

670,774. Apparatus for Forming Elements for Electric Accumulators. William Gardiner, Chicago, Ill., assignor to the Helios-Upton Company of New Jersey. Filed April 28, 1900.

670,808. Method of Electric Welding. John C. Perry, Clinton, Mass. Filed Sept. 15, 1899.

670,877. Primary Battery and Process of Regenerating Same. Henry K. Hess, Philadelphia, Pa., assignor to Herman J. Dercum, trustee, same place. Filed Dec. 21, 1900.

670,914. Sparking Igniter for Internal-Combustion Engines. Carl H. Blomstrom, Marquette, Mich., assignor to the Lake Shore Engine Works, same place. Filed Nov. 8, 1898.

REISSUE.

11,899. Means for Propulsion of Vehicles by Electricity. Frederick J. Newman and Josef Ledwinka, Chicago, Ill., assignors, by mesne assignments, to the Hub Motor Company of New Jersey. Filed Feb. 11, 1901. Original No. 638,643, dated Dec. 5, 1899.

COMMERCIAL PARAGRAPH.

Elsewhere in this issue will be found the advertisement of Mr. William B. Lynch, 101 Beekman street, New York. Mr. Lynch has been engaged in pattern and model making for the past fifteen years and has had wide experience with electrical apparatus and the parts that go to make up electrical machinery. He is prepared to undertake pattern and model making of every description.

THE TELEPHONE WORLD.

Western Telephone Companies' Success.

President Charles S. Bash of the Home Telephone Company, Fort Wayne, Ind., tells by what means the independent movement has been developed in the West, and suggests:
